13,178. How much does a basket bring?—11*l.*, 12*l.*, 13*l.*, in years gone by, when the fish was scarce, but the same basket has been known to be sold as low as 2*l.* or 3*l.*

13,179. In years gone by?—Yes.

13,180. There is not so great a disparity of price now-a-days?—No.

13,181. Is that because there is a greater regularity of supply?—Yes; to sell a basket for 30*s.* is a low price. Last week I sold one at 5*l.* and another at 6*l.*

13,182. How was that?—On account of the gale.

13,183. The very stormy weather?—Yes.

13,184. That was an exceptional case?—Yes, I think the market is better regulated and is better

for the buyer, better for the catcher, and better for the consumer than ever it was.

13,185. The price is more regular from week to week?—Yes, and the supply is the same.

13,186. (*Mr. Lefevre.*) Are you the owner of a trawling boat?—Yes, of two, and I have half of two more.

13,187. What ground do you fish over?—We fish from Cuxhaven at the mouth of the Elbe, as far west as the bay of St. Ives.

13,188. Do you principally fish in the Channel?—Yes.

13,189. Not in the German Ocean?—Our vessels are now fishing in deep water at the Back Knoll off the coast of Suffolk.

13,190. I suppose there is a great deal of ground that has not been gone over by the trawlers between this and the foreign shores?—Yes.

13,191. Would a little increase in the price of fish enable you to go further off?—We should have gone further off last summer if there had been more ice. From Ramsgate we went as far north as Hull.

13,192. Has the increased price of ice been materially felt with regard to the distance you can go out?—Yes.

13,193 Then a slight increase in the supply of ice would enable you to go further out to sea?—Yes.

13,194. And trawl over new ground?—Yes.

13,195. Is it your opinion that the fish change their ground a good deal?—Yes, I believe the fish is constantly on the shift. As soon as they come on the Knoll they go into deeper water. The state of the sea itself seems to be constantly changing. Frequently we have weeds coming off the rocks quite green, and it gets ripe the same as if it were in the fields. North of Dover we find the best turbots we can find in the English Channel; though they are not in great quantities they are sufficient to pay a large fleet to go there; but if frost sets in there would be neither turbot nor brill on those banks.

13,196. Are there boats there trawling all the year round?—From the back end of February there have been about 13 or 14 vessels belonging to Dover trawling there. It is principally confined to these vessels. It is the same with regard to the banks off Ramsgate, at the back of the Goodwin Sands.

13,197. Are the fish brought up in the trawl ever damaged by being knocked about?—I never saw a bushel of fish damaged except we had a great weight. Some of them might be nipped by the rope cast round the net.

13,198. You have no large quantity of unsaleable fish in consequence of their being damaged by the net?—No.

13,199. Is any quantity damaged in consequence of taking up stones in the net?—It is very rarely we heave up stones in the net.

13,200. Did you ever heave up any spawn?—Never in my life. I have found a good deal of spawn on the deck after I have gutted haddocks.

13,201. That came from the inside of the haddocks?—Yes.

13,202. You have never brought it up in the trawl?—I never saw any brought up in the trawl.

13,203. In your opinion is it desirable that there should be any legal beam or mesh?—Well, I don't think they would do any good by that. Fishermen are generally keen enough to study their own interests.

13,204. Do you think the law on the subject should remain as it now is?—With regard to that $1\frac{3}{4}$ inches from knot to knot along the line, I think the greatest portion of the trawl is wider than that, but it narrows gradually to the 100 mesh piece, and the same with the cod end.

13,205. Have you ever had your trawl overhauled by any Government officer?—Never.

13,206. (*Mr. Caird.*) Do you get a supply of fish occasionally from Torbay?—Yes.

13,207. Is there a large proportion of fish coming from Torbay to the London market?—A good lot of fish comes from Torbay to the London market.

13,208. Is the quality of the Torbay fish equal to what you get on the west coast?—Yes.

13,209. Much the same?—Yes, it is very good indeed.

13,210. There is no decline in the quantity?—No. What Mr. Hewett meant by saying that I sold Torbay fish was this; he alluded to the Ramsgate vessels, they were originally Torbay men, and they go by that name in Billingsgate now, although it is not Torbay fish. I do sell some Torbay fish, but I am not the principal salesman, no further than that the Torbay men came from Brixham in former years and settled at Ramsgate, and I have been selling for them.

13,211. Is a large proportion of the fish in the London market supplied from Torbay and the west coast?—The Torbay fish will average about 300 baskets a day.

13,212. What proportion will that be of the whole supply?—Not a fiftieth part of the whole.

13,213. (*Mr. Lefevre.*) Have you found that the last year has been an unprofitable one for trawling?—Yes, I believe it has been an unprofitable one for nearly every description of fishermen.

13,214. To what do you attribute that?—We have had so many calms.

13,215. Do you not catch the same quantity of fish?—No. If we have not wind enough to pull the trawl over the ground we can't get as many fish; but, taking the whole year through, there has been more fish this year than in any year I remember.

13,216. Then it has not fetched a good price in the market?—No.

13,217. In consequence of coming in greater quantities?—Whenever there has been any at all there has been a great quantity. The market has been up one day almost unbearably, we hardly knew how to ask enough of money for the fish; but the following day, in consequence of a large quantity having come in, we could hardly ask little enough for it.

13,218. Has the cost of ice had a material effect upon that?—The fish would have come more regularly if there had been plenty of ice than ever it has done. We have had an increase in the vessels. The introduction of the Hull fleet would have done us a great deal of good.

13,219. Then this year has been an exceptional year?—It has been. A month ago there were three vessels that went from Rye Bay. One saved from a haul 45 pads of fish, while the others broke their nets alongside.

13,220. (*Mr. Caird.*) Was that in consequence of having more fish than they could draw up?—They had more fish than they could haul up at once. It was alongside for three or four hours, but ultimately the net broke away.

13,221. The catch was so heavy that they could not bring it safely on deck?—No. Other men have told me that it was the largest haul they had ever seen in their lives.

13,222. (*Mr. Lefevre.*) Where do the whitings come from that are brought to the London market?—A great portion come from Folkestone.

13,223. How are they caught?—By the trawl and the hook-and-line too.

13,224. Has there been an increase in the catch of whiting?—Yes.

13,225. Do many come from Torbay?—Yes, a great many come from Torbay every day.

13,226. (*Mr. Caird.*) With regard to the nets that broke away, what weight of fish do you think there would be in them if they had been brought safely on board?—If they had been brought safely on board there must have been at least from three to four tons of fish in them. The vessel that did save her haul had 55 cwt. That was sent here, and there were seven baskets sent ashore at Hastings and sold. I had the 55 cwt. and paid the carriage for them.

The witness withdrew.

BILLINGSGATE.

H. Marchant.

18 Nov. 1863.

HENRY MARCHANT called and examined.

13,227. (*Mr. Caird.*) You have been for some years engaged as a fish salesman?—Yes; my family have been engaged in that way for 100 years.

13,228. As fish salesmen and fishermen?—Yes. I have an uncle alive now who is nearly 90 years of age.

13,229. What is the experience you and your family have gained during that time as to the supply of fish to the London market?—From what I have heard my uncle say of the olden time they used to come to London with two bushels of soles. At that time they use to fetch 10*l*., 15*l*., or 20*l*. a bushel. Now if we had a vessel that went for a week or a fortnight and came in after a voyage with two bushels of soles we should think the master had gone mad.

13,230. What would you expect to get now?—If we send a vessel to sea for a week we expect about 15 or 20 boxes. A box is equal to a bushel.

13,231. Are you at this moment engaged largely in fishing?—Yes, we have 50 sail of vessels. Mr. Morgan and William Marchant and I are brothers-in-law.

13,232. You have 50 vessels now?—Yes.

13,233. Are they all engaged in trawling?—The greatest part, except about nine.

13,234. Are the nine engaged in line-fishing?—Yes.

13,235. Do you fish for the West End market in the same way as Mr. Hewett?—Yes.

13,236. That is the object of your line-fishing vessels?—Yes.

13,237. (*Mr. Lefevre.*) Do all these vessels hail from London?—Yes, from London. We live at Barking.

13,238. (*Mr. Caird.*) Can you describe from your experience, beginning at January, the different seasons for different kinds of fish supplied to the London market?—I cannot. I know what quantity we sell in the year of all sorts. We sell about 20,000 baskets in a year.

13,239. Are there not particular seasons for particular kinds of fish?—No. Sometimes we have an abundance of plaice come in when we little expect it, and sometimes we have an abundance of soles. It varies very much in a season. This summer we have been catching nearly all soles for three months. It would not pay us, not having a sufficient quantity of ice, to catch offal. If we had had a quantity of ice we could have sent ten baskets of plaice to one of soles, but having only a small supply of ice we fished on the ground where there were most soles.

13,240. Do you on the whole agree with the previous witnesses who say that the supply of fish to the London market has been progressively increasing?—Yes. Seven years ago I sold for about 46 vessels; now I sell for about 36, and I have sold about 2,000 packages more for the 36 than I did a year or two ago the 46.

13,241. Has that great increase taken place within the last two or three years?—Yes, there has been a great increase of fish.

13,242. Each vessel, in your opinion, catches more fish?—Yes. I had five vessels about a month ago that had been fishing for two nights. The one was calm and one was breezy, and these five vessels caught for one night about 17 tons of fish. I was talking to one of the captains about it, and he told me that one of the vessels had been trawling for four hours, and when he came to haul up his net he had so many fish in it that they broke it all in pieces, and out of the fragments he saved 14 baskets of fish.

13,243. On what fishing ground was that?—It was on the westernmost part of the Dogger Bank.

13,244. (*Mr. Lefevre.*) Has that been tried for the first time?—It has been trawled over for the last five years.

13,245. (*Mr. Caird.*) Has there been any decrease in any particular kind of fish that you have observed?—Soles are on the increase. We get now about three or four baskets a night; in former years we only got two a night. To-day the vessels have run from three to four or five boxes.

13,246. From each vessel?—Yes; one had seven, and I think the lowest had three for the night's work.

13,247. Do you think the quality of the fish is as good as it used to be?—I think it is a little better. When I was a boy of 12 or 13 years we could scarcely get five pair of large soles out of 50.

13,248. How is it now?—The fish are now a great deal better than they used to be.

13,249. Are they larger and finer in quality?—Yes; we used to take all the small fish out and put the middling sized and the best together. We could not sell them otherwise.

13,250. Have you any knowledge of the supply of herrings to the market here?—I don't sell herrings.

13,251. Or dried fish of any kind?—I don't sell dried fish.

13,252. Or shell-fish?—No.

13,253. Do you sell any fish to the foreign market; do you sell any to go to Paris?—I sell to friends who buy for that market.

13,254. Is there any large quantity sold in that way?—At times there is a goodish sprinkling sold.

13,255. (*Mr. Lefevre.*) I think you said you sell for 36 vessels now?—Yes.

13,256. Are they in addition to your own?—I have three of my own and 33 others.

13,257. I thought you said you and your brothers had more than that?—We have 50 sail without those.

13,258. Do you not sell for the 50?—Those 36 are from Hull and Grimsby; that is a different branch.

13,259. Where do your own 50 vessels fish mainly?—We fish from Orford Ness down to the Texel island. For the last 36 years we have been down there.

13,260. You don't send them further north to the Dogger Bank?—Very seldom. We generally keep higher up on the old fishing ground. Those vessels which fish on the lower ground encounter a great deal of bad weather. They cannot fish down on the Dogger Bank when we can fish off Yarmouth.

13,261. The further off you go to sea the more danger you encounter?—Yes.

13,262. You have not found that your grounds have been at all over-fished?—No; if I were going over to-morrow I should go according to the weather. When I was a boy, if it was frost, we went into deep water, and if it was mild we went into shoal water.

13,263. Have your 50 vessels an admiral?—Yes.

13,264. Have they other boats with them?—Yes.

13,265. What kind of distance do they keep from one another?—They are constantly within hail of one another, even with their nets down. Those right in the tide expect to get as much as those fishing in front of them.

13,266. Sometimes they follow each other?—Yes. Sometimes one vessel will lose different things, and another vessel a quarter of a mile off will pick them up.

13,267. You don't find that one catches fewer than the other?—When there are 50 sail fishing together we expect all of them to have within three or four pairs of soles of each other. We express astonishment when one man gets a trunk more than another. We think it is owing to neglect, and believe there is something wrong with the vessel.

13,268. Do you keep a tally?—Yes.

13,269. Do you keep statistics of the quantity of fish caught by each boat in the course of the year?—No, we keep an account weekly, but after the fish is sent to the different salesmen it is done with. We make out an account every week and send it to the owner, and take no more notice of it.

13,270. Do you meet with any foreign boats on the grounds you fish?—We meet a great many Flanders vessels; they have increased in number since I was a

boy. When I was a boy there were five or six of these vessels out of Belgium, and now there are about 40. We used to buy fish out of the Dutch boats because we did not ourselves know how to fish then.

13,271. Do your vessels fish with the Dutch vessels on the Dutch coast?—About 30 miles off, and in the summer time within five or 10 miles.

13,272. Not nearer than that?—No.

13,273. Do your boats observe the legal trawl or do they use whatever they like?—Some of the beams are 32 feet long, and some 42, according to the size of the vessel. A vessel of 50 tons will have a beam 32 or 33 feet long, while a vessel of 70 tons will have one 40 or 42 feet long.

13,274. There is the same difference with regard to the weight?—Yes; if a large vessel had a small trawl she would catch no fish at all, it would be floating on the water.

13,275. Do you find that you derive any advantage from using larger boats?—Yes, they have a larger spread, and if a man has a larger rake of course he expects to rake up more.

13,276. Do you regulate that?—We leave it to the captain. If they say that they would like to have a 36 or 40 feet beam they have it cut according to their fancy. The same net that would do for a 40 feet beam would do for a 44 feet one, and the same heads and the same rope.

13,277. Do you leave it to the admiral of the fleet to say where the boats shall be taken?—Yes, we throw all the blame upon him if he is upon a bad spot fishing long, and we send him a reprimanding letter.

13,278. What do you pay your admiral?—We give him two guineas each voyage as an extra donation.

13,279. He is paid the same as the other captains?—Yes, with his two guineas a voyage for extra services.

13,280. How long do they generally stay out?—Sometimes six weeks, and sometimes eight or nine weeks.

13,281. Then do they come back again?—Yes.

13,282. How long do they stay?—They refit and go out again.

13,283. That is the case all the year round?—Yes.

13,284. (*Mr. Caird.*) Do the boats vary much in their catch?—Not much. Very few of them will vary 10*l.* in the year.

13,285. You have heard the different witnesses who have been examined this day, may they be taken as a fair specimen of the different salesmen in Billingsgate?—Yes.

13,286. Do you think we have ascertained through them pretty accurately the state of facts as regards the supply of fish to the London market?—Yes. Mr. Deering could have told you that when he first came here there were about 30 salesmen, and now there are 60, so that according to the increase of fish in the market there has been an increase of men.

13,287. Does each of the salesmen now do as much business as when there was the smaller number six or eight years ago?—I think there is not much difference.

13,288. Would you take the increased number of salesmen as a mark of the increased number of fish?—Yes, I don't think there is a stand now to let in the market.

13,289. Are there more stalls in the market than there used to be?—Yes, treble the number. The market has been twice enlarged since I was a boy.

13,290. At this moment there is not an empty stand?—No, there is a man in the room now who has been without a stand for two years.

13,291. There has not been one to be had?—No.

13,292. (*Mr. Lefevre.*) Have you found that the last year has been an unprofitable one?—It has not been quite as good as other seasons; we have had extra expenses. 50*s.* is a long price to pay for ice, when we have been in the habit of getting it for 7*s.* or 8*s.* We store about 3,000 tons.

13,293. Then this year is an exceptional one?—Yes.

13,294. Do you agree with the last witness that the take has been large sometimes and indifferent at others, and that that has made a great variation in the price?—Yes; sometimes we have had four vessels up here full of fish, and the next day not one.

13,295. You don't think the supply of fish has been less?—I think that the boats I sell for have had more fish than I ever knew.

13,296. Do you agree with the other witnesses that there is plenty of room for more trawlers?—If there were 100 more trawlers out this year, I believe it would not make a difference in the catch brought to market by each boat.

13,297. It would affect the price, but not the catch?—Yes.

13,298. Are new markets opened?—Two years ago they built 40 sail out of Hull, but we have found no difference in the price.

13,299. Have you any liners?—No; I have sold them.

13,300. Have your brothers any?—Yes, nine.

13,301. Are they engaged in hand-lining?—Yes, hand-lining and long-lining; they are long-lining now, and they are catching large quantities of cod.

13,302. Do they pay as well as trawlers?—Just now they are paying better. Cod is fetching a good price; and the trawlers have had a deal of bad weather to encounter.

13,303. Do they catch many haddock?—On the Dogger they catch a great many, but they salt them. It would not pay them to keep them in the well; they are a sickly fish, and they would die.

13,304. Do the long-line men fish principally for haddock?—Yes.

13,305. What is the price of hand-line-caught haddocks?—For good haddocks the first six would fetch 12*s.*

13,306. Two shillings a-piece?—Yes, for the best. The next 12 haddocks would come down to 9*s.*, and perhaps in the latter part of the morning they would come down to 5*s.* a dozen.

13,307. What is the price of trawl-caught haddocks?—We should sell a box of trawled haddocks containing three dozen for 10*s.* or 12*s.*, but for my own part I would sooner have a good trawled haddock than a lined one.

13,308. Are trawled haddocks used for all purposes?—Yes, the fishmongers often sell them out the same as line haddocks; many of them are larger and better. All the fish that are caught in the trawls are good if they are only brought up in ice as they ought to be.

13,309. Still on the average the line-caught haddocks sell for more money?—They are more bright—they are beautifully bright, and they sell better when they are not really as good fish.

13,310. Do you sell for many fishermen in the north?—I sell a good deal for Hull and Scarborough.

13,311. Do you sell for any line fishermen in Scarborough?—No, they get so small a quantity that it would not pay them to send them up here.

13,312. Do they send to the provincial markets?—Yes, but they don't get a wheelbarrowful in comparison with what we catch in the North Sea. They go off for about two days a week, and catch about threescore of cod. We have 9 or 11 hands on board our vessels, and we have sometimes four cutters up, and occasionally as many as ten, each holding 20 tons of fish, and all of them are cleared out in a day.

The witness withdrew.

JOHN GEORGE BAXTER called and examined.

13,313. (*Mr. Caird.*) Are you a fish salesman here?—Yes; more particularly among shell-fish, sprats, and shrimps.

13,314. Has the supply of sprats to the market here been increasing or diminishing?—It has not been so large this year as formerly.

BILLINGSGATE,

J. G. Baxter.

18 Nov. 1863.

13,315. Is the main supply brought here by railway overland from distant parts?—A great deal comes from Scotland; at least that has been so for several years until the present year, when there have been so very few caught that there has only been enough to supply the home market.

13,316. Is there any difference in the quality of the Scotch and English sprats?—The Scotch sprats are much larger.

13,317. Do they bring a higher price?—Yes, generally.

13,318. Is there any large quantity brought generally to the London market from Scotland?—Some days we have had as many as 100 tons.

13,319. Do they chiefly come from the Firth of Forth?—Yes.

13,320. From Queensferry?—Yes, Queensferry and Newhaven.

13,321. In what months are they chiefly brought to market?—From November till the end of February.

13,322. Have you any idea of the number of tons that is sold weekly during the season?—Well, some days we have scarcely any, and other days we get large quantities; then perhaps we may be a week and have only a small quantity each day. Now the last week we had a good few, especially at the commencement of the week. They were brought here by water last Monday week. An immense quantity of them was caught at Teignmouth in Devonshire. They could not get packages to send them away, and they were obliged to send them away loose in trucks. We had a telegraphic message in the morning saying that 100 tons were coming up by special train. That was after we had already received from 500 or 600 to 800 packages in the morning; but when the sprats came there were only 10 tons instead of 100; 90 tons had been left at Bristol or Bath, because they were loose.

13,323. Why was that?—Because they would have been of no use to us when they reached Paddington. We should have had to shovel and knock them about, and they would not have sold in our market. At Bristol, however, they sold very well for sending to different parts.

13,324. Would they go away from Bristol principally to Birmingham?—Yes, and to Cardiff and other places.

13,325. Taking one year with another, has the supply of sprats been increasing or diminishing?—Increasing on the whole.

13,326. Does it form a large article of food for the poorer classes of the people of London?—Yes, when the sprats fetch a good price here.

13,327. What do you call a good price?—A good price is about 6*s.* a bushel. We call 6*s.* a bushel a good price, and sometimes they will fetch 8*s.* Allowing them to fetch 8*s.* a bushel, there are about 80 lbs. weight of fish in a bushel, so that they are a very cheap fish; yet when they are at that price the poorer classes of people can't touch them. They are frequently sold here at 2*s.* or 3*s.* a bushel, and I have sold sprats at 1*s.* a bushel, and even less than that.

13,328. Then they are the cheapest fish per pound weight that comes to the London market?—Yes.

13,329. Then anything that would interfere with the supply of sprats to the London market would be felt as a serious grievance?—Yes.

13,330. Have you observed whether there are immature fish of other kinds mixed with the sprats?—Sometimes, but very seldom. It is only when they catch a few sprats that they catch other fish with them.

13,331. Then the supply is really of sprats and not of other fish?—Yes, we have had as many as 10 vessels with from 300 to 400 bushels in which you would not be able to pick out a gallon of other kinds of fish out of the whole cargoes.

13,332. Have you any means by which you can lay before us the number of tons weight of sprats that come to the London market in the course of a season?—That would be a very difficult item to get at.

13,333. Can you not estimate it at all?—No, there are so many that come by rail and by water that there is no regularity in the mode of conveyance.

13,334. But can you not give us a rough estimate of the quantity?—I don't think I could. I could not average it at all satisfactory.

13,335-6. But in the course of an average week's supply how many tons do you think will be brought into the London market?—The chief market is probably before Christmas. After Christmas if any quantity comes, it is sold at very low prices; then if the vessels catch any great quantity they are sold for manure. Vast quantities are sold for manure—hundreds and thousands of tons.

13,337. Are they sold in London for manure?—Yes, sometimes. They send barges and boats from Maidstone to take them from the fishermen when they are caught. They know if they are likely to bring a good price in London, and they act accordingly. There are sometimes 100 little boats going from vessel to vessel when they are engaged in stowing for sprats. They lie at anchor, and these little boats go alongside buying 10 bushels from one, 50 from another, and 20 from another, according to what the catch has been. They will bring what they pick to the market and of course they get a better price for them in the market than by selling them for manure. The boats that fish for them wish if possible to get rid of them every tide.

13,338. Is a large proportion of the whole catch in the course of a season sold for manure at the mouth of the Thames?—Not at this season. They are sold for food now, but after Christmas perhaps a greater part will be sold for manure.

13,339. Does the taste of the people for sprats abate after that time?—The sprats are not as good then, and the people, after there has been a great quantity, get tired and want something else.

13,340. With regard to the supply of shell-fish, you are also in that trade?—Yes.

13,341. Do you agree with the previous witnesses that the supply of lobsters to the London market is on the decrease?—Lobsters don't come within what I call shell-fish.

13,342. What kinds do you sell?—Oysters, mussels, whelks, perriwinkles, and shrimps.

13,343. How is the supply of oysters now compared with what it was 10 years back?—We have now a supply that comes all the year round. A few years back it only commenced in August, and they only sold until old May-day—about the 12th of May.

13,344. Do you now sell them all the year round?—Yes.

13,345. Are they in condition all the year round?—Yes. I believe they are in better condition during the months of May and June than at any other time of the year.

13,346. Is there a good demand for consumption during the months of May, June, and July?—Yes.

13,347. Do they sell readily during these months?—Yes, but they are a commoner kind of oyster. The native oysters—the oysters that we bring on to our beds—are not sold then. It is not for our interest to remove them during the summer because they are then growing, and it is from their growth that we obtain our remuneration.

13,348. At what season of the year do oysters bring the best price?—The native oysters have got up to a high price on account of the short supply and scarcity.

13,349. Has the supply of native oysters become smaller?—Yes.

13,350. The native oysters are oysters fed upon the oyster beds?—It is rather a difficult matter to define what a native oyster is. Nobody but an experienced man can define what a native is; there are no peculiar fish in any part of England that would be called native in the London market. It requires certain conditions to convert it into a native.

13,351. What is the particular characteristic of the London natives?—The natives are caught just at the mouth of the Thames generally. They are spatted,

and then the brood comes. Then they are removed from Essex to Kent, to come to maturity at the latter place. They have a small deep clear shell that is almost transparent.

13,352. Are they only found in the river Thames and its tributaries?—Natives are got nowhere else.

13,353. They are not found anywhere else?—No.

13,354. Are they the principal supply of oysters to the London market?—No. The natives at the present moment are fetching 70*s.* a bushel, while the common kind of oysters are only fetching 10*s.* a bushel.

13,355. Are the natives that bring such a high price a very small supply comparatively?—Quite so.

13,356. What proportion of the whole supply to the London market will consist of natives?—There is a company called the Whitstable Company that sell natives; their stock at the commencement of the season will be worth 100,000*l.* or 120,000*l.*

13,357. Do you mean pounds weight?—No, value.

13,358. One hundred and twenty thousand pounds sterling?—Yes, before they commence selling them. Then there is the Colchester Company whose stock will be worth from 10,000*l.* to 15,000*l.*, and there are three or four smaller companies that have them.

13,359. They have special grounds belonging to themselves with which they permit no interference?—Yes, they buy the native brood from Essex, and from the mouth of the Blackwater, from the river Crutch, and the Colchester river. They lay it on these grounds, and it remains there until it comes to maturity.

13,360. Where are their grounds?—The Whitstable grounds are opposite Whitstable.

13,361. Is that where the natives feed and are brought to perfection?—Yes.

13,362. Is there a recognised right on the part of anybody to the oyster beds there?—Yes.

13,363. Who gives that right to the Whitstable Company?—It is possessed by the inhabitants who become freemen.

13,364. They possess a right that is generally recognized?—Yes, the Whitstable Company is a company of the inhabitants of the place. Nearly the whole of them are freemen.

13,365. Then it is a joint concern among themselves?—Yes.

13,366. Upon these grounds you say the supply has been gradually decreasing?—It has been gradually decreasing upon all the grounds; the brood has been diminishing.

13,367. From year to year the supply has been becoming less?—Yes; but one good year of spawn, what we call spat, will supply all the grounds for five or six years to come.

13,368. There has not been a good year lately?—No, not for five or six years.

13,369. But a good year might come and then the supply would be as good as ever?—Yes.

13,370. You don't suppose the time will come when all the oysters will be fished out?—No.

13,371. Can any of the oysters from distant places become oysters of as good quality as the natives?—Other oysters would not, but my opinion is that spawn from them on the native grounds would become natives. I know that from experience. I rent a ground down at Southend, about 40 miles from London, and the first year I had the ground there had not been any spat falling upon it for 20 years. A few oysters might be picked up occasionally but not many. The first year I had that ground I laid on it about 500 bushels of oysters from Jersey. It was a small cargo of about 500 bushels. The summer happened to be very warm, and in May the oysters spawned; they spawned early that year. The weather being warm and settled, the spawn had scarcely left the oysters before it adhered to the shells and other rough substances about. In consequence of its being warm weather the ground became stocked, and in the winter time the sand came over the beds and protected them. Providence seems to protect the brood in that way. About seven or eight years ago I picked up as many oysters as I was enabled to sell to the Whitstable people for about 700*l.* or 800*l.*, and for the next three successive years I picked up quite as many; but no spat has fallen since then.

13,372. Did the brood of the Jersey oysters become natives?—Yes, they were natives.

13,373. Then you hold from your own experience that the importation of oysters from another quarter spawning upon these grounds gives you the same quality of oysters as those that are liked in the London market, and are called natives?—Yes, the French have a different idea. One of them came to me last year, he represented a company that had just been formed in Grenouille with a capital of 80,000*l.* They had made beds and laid out that sum on them, and they wanted native oysters to stock them with, thinking that native oysters here would breed native oysters there; but according to my idea they will find themselves very much mistaken.

13,374. Do you think that they will not become natives?—No, they will grow and spread, and not become natives at all.

13,375. You say that you take the oysters from the Essex to the Kentish coast?—Yes.

13,376. Have the grounds on the Kentish coast some peculiarity that adapts them for feeding oysters?—Yes, they get to perfection there better than anywhere else. They feed very well at Colchester. This year there have been better oysters there than I have known.

13,377. Are there any means of feeding them artificially?—No, not on the grounds.

13,378. At what age are the natives taken for use?—When they are about four years old.

13,378*a*. How long do they lie on the ground before they are taken for use?—You remember what I said just now about Southend. They laid there 18 months before I picked them up. Some were of the size of a shilling, and some the size of half-a-crown. They were then laid down at Whitstable for two years, and after that they were sold as natives.

13,379. Is there a regular succession of grounds that you go over year by year?—At Whitstable they have an immense extent of ground, and are always removing them from one part to another. Those that are fit for market next year they will put upon one place, and they will put the small ones upon other parts.

13,380. Then you know what grounds to go upon?—Yes, they are all buoyed out.

13,381. Are they left dry at low water?—No; there is a portion of them left dry at Whitstable at very low ebbs, but it is very small in extent. My grounds at Southend are all dry at ebb tides, so that we can go and pick anything up there we like.

13,382. Is the supply of other kinds of oysters except natives on the increase to the London market?—No.

13,383. Do many French oysters come here?—No, it is the French market that makes ours so scarce.

13,384. Do you send oysters to France?—Yes, I have got some in a boat just now going away to Dunkirk.

13,385. Then there is an export of oysters to France, and no import?—There is no import.

12,386. Has the price of oysters risen considerably of late years?—Yes.

13,387. Is it on the increase?—Yes, on account of the French market; I sold about a month ago 600 bushels of natives. They were taken away in three cargoes, one was to go to Holland, another to Belgium, and another to Dunkirk in France.

13,388. Did they go for immediate consumption, or were they put on breeding ground?—Our grounds supply all parts of the continent.

13,389. Were they the same kind as those which are removed from the Essex to the Kentish shore?—Yes.

13,390. Is there a large business going on in the export of oysters to foreign markets?—Yes; I have grounds in Kent where I have sold oysters from.

13,391. Were the oysters ready for the London market that were sold to go abroad?—Yes.

13,392. But I thought you said they put them on

BILLINGSGATE.

J. G. Baxter.

18 Nov. 1863.

beds?—They put them on beds in order to keep them. Some of them might be sold to-day, others a month hence.

13,393. They were not placed there for breeding purposes?—No; what I sold for breeding purposes was another concern altogether.

13,394. From what other quarters do oysters come to London?—We get them from Ireland.

13,395. Are they of good quality from Ireland?—Some of them are of very good quality, but the principal part of them requires to be laid on our beds. We get a great many from there, as many as between 6,000 and 7,000 bushels.

13,396. Is it usual to lay all oysters that come from distant parts of the coast on to your own beds in the Thames before they are brought to the London market?—Yes; it improves the oysters. They grow and get better in colour, and both the shell and the fish itself are improved.

13,397. (*Mr. Lefevre.*) The diminution in native oysters is rather due to the bad brood?—Yes, in a great measure.

13,398. It is not because the oysters don't spawn, but on account of the unfavourable weather at the time they did spawn?—Yes, they require still and warm weather. Under such circumstances, if the spawn falls, it falls on the shelly ground and adheres, but if it falls on the mud or the sand it comes to nothing.

13,399. Do you think the supply of native oysters might be increased by laying out more beds?—No.

13,400. Is there much space for fresh beds?—I don't think there is.

13,401. Do you think it requires a peculiar combination of things—does it require a supply of fresh water and salt water to make a favourable place for a bed?—Yes; I don't think there could be any improvement in the beds. The French have been attempting at Southend to produce oysters artificially, but their efforts came to nothing.

13,402. They have not been a success so far?—No, it was tried also at Ipswich, but was quite a failure.

13,403. You have a bed at Southend?—Yes.

13,404. Was it a bed before you had it, or did you make it?—It was a bed, but no spat had fallen on it for 20 years before. The spat fell on it then; it got into the ground and lasted for three years.

13,405. It may be some years before there is another fall?—Exactly so. We watch them at spawning time. We take up the shells to see if there are any signs. In Essex we have even gone as far as to get a microscope.

13,406. What time of the year do they spawn?—It depends upon the weather. From May until August. Last year it was in July and August.

13,407. In your opinion the supply of native oysters could not be largely increased by laying out fresh beds, or by the artificial propagation of oysters?—No.

13,408. Could it be increased by protecting the beds that lie further out at sea?—No.

13,409. There are beds open to everybody to fish?—Yes; at the mouth of the Blackwater, just below the Whitstable ground, from Whitstable down to Herne Bay. That is below where we catch the native oysters.

13,410. Are those beds fished now there is scarcely anything upon them?—Very little indeed.

13,411. By protecting them would no good be done?—No, if there came any spat it would fill them up. About six years ago there was a spat here, and every little bit of wood, or bone, or pipe, or whatever it was, got something on it. In fact, it was a whole mass of oysters.

13,412. Very few oysters in a favourable season will be enough to supply spat for all the grounds?—Yes, very few if it takes.

13,413. I think you also said that you had observed a decrease in the inferior kind of oysters. That has been on account of the French market and not on account of the quantity falling off?—No, I don't think so.

13,414. Is France now a competitor with the London market?—Yes, they are competitors everywhere. They have a steamer running from Wexford in Ireland in order to take oysters to the west part of France, and they have also vessels over at Shoreham, Newhaven, and Falmouth.

13,415. What is the greatest distance that oysters can be brought profitably to the London market?—From the west coast of Ireland. From the west coast of Ireland they can come by rail, and if they come by rail they come good.

13,416. How long will they keep good?—That depends upon the coldness of the weather. In February and March in cold water if it is clean and there is not much dirt in it they will keep for eight days, but not otherwise. I had a cargo last year at the latter end of March from Wexford, and before it had been on board 48 hours it began to heat, and we had to put them in at Falmouth, and put them overboard there. They were just as if they had been boiled; they were quite hot.

13,417. Do some of the oysters you get ever approach the price of the natives?—The nearest to the natives are 24*s.* a bushel, while the natives will fetch from 60*s.* to 70*s.* a bushel.

13,418. Where are the oysters obtained that are worth 24*s.* a bushel?—They are caught at Falmouth, in Cornwall, and laid on our beds to improve.

13,419. Laid on your beds, or down there?—They come up to our beds, and they improve more than any other oyster. They are very green and coppery when they are first caught; they are almost as green as paint, even inside.

13,420. Do you know enough of oyster-fishing down on the coast to know whether the supply can be increased?—I am sure it could not be increased by artificial means in any way.

13,421. Could it be increased by any protection the State could give to the fisheries?—No; as I said before, if there comes a spat we shall have a supply for years to come. If a spat comes that is all that is required.

13,422. With regard to perriwinkles, do you sell any large number of them?—Yes.

13,423. Where does the supply come from?—From the islands of Scotland. From the Orkney islands, the Shetland islands, and all around the Scotch and Irish coasts.

13,424. How do they come to London—are they sent by rail?—Chiefly by rail, but we get some by sea occasionally.

13,425. Do they keep any length of time?—In the winter time they will keep for a fortnight or three weeks out of the water.

13,426. Has the supply increased or fallen off?—It has increased as much as a third.

13,427. Has the price fallen?—No; the price is more than it was. I can remember a circumstance that took place about 24 years ago that will give you some idea of the increase. I remember on Whit-Monday there were only 50 bushels in the market, and those 50 bushels were not all sold on that day. It took two days to sell them. Now I should say we sell from 300 to 500 bushels in the same time, and that at quite as good a price.

13,428. They are bought very largely by the lower classes?—They are used by all classes; they are sold in almost every street in London, and I send some away into the country; but many of the country places are supplied elsewhere.

13,429. Do you get any perriwinkles from the Kentish coast?—There are a few at Whitstable.

13,430. They come chiefly from a distance?—Yes.

13,431. With regard to shrimps, do you sell them largely?—Yes.

13,432. Has the supply increased in the same ratio?—I think I may say the supply of shrimps has increased equally with the demand. We get a supply from Holland; in fact we are getting them now. I had 50 baskets the other day; 50 baskets came in on Monday, and 20 on Sunday, each basket containing about 11 gallons. I have had as many in the summer as 300

and 400 baskets in a week, each basket holding from 10 to 12 gallons.

13,433. Are large quantities caught in the south of England and sent to the London market?—Yes; the chief place where they are caught is Lee in Essex. They are caught just at the mouth of the Thames. You were speaking some time ago to Mr. Hewett as to whether the stoppage of the trawls in the bays would interfere with other kinds of fishing. It would not interfere with the ordinary fishing, but it would interfere very materially with the shrimpers, because they trawl for shrimps in the bays.

13,434. Hand-trawling?—No, trawling in deep water from Hope Point down to below the Mouse; from Orford-ness to Dungeness.

13,435. Are they sent to the London market from there?—Yes, chiefly.

13,436. Has the supply been kept up or not?—The supply has been more regular since the railways enabled them to get the fish into the market good.

13,437. That has increased both the demand and the regularity of the supply?—Yes, it is the same with winkles; it is thought that the regular supply has caused the demand.

13,438. Did they formerly come by sailing boats up the Thames?—Yes.

13,439. Now they come by railroad, and the supply is more equal all the year round?—Yes, I have been a fisherman myself, and have been shrimping. I have seen 12 or 14 boats out from Lee, and the best boats among them would not be worth more than 30*l.* At the present time they have about 120 boats, and I should say that 50 or 60 of them will be worth 150*l.* each. The men themselves are a class of men than whom better sailors never stepped.

13,440. How many go in a boat?—Two.

13,441. Do they catch any other fish in the net?—Sometimes where there is a spat of small mussels they get to the edge where the mussels are. The spat of the mussels falls according to the streamage of the water. When it falls they go just outside, so as to get clear of the mussels, and take out the fish that is feeding upon them.

13,442. Do the shrimps feed upon the spawn of the mussels?—All kinds of fish do.

13,443. Is there a large supply of mussels on that coast?—No, the mussels don't come to maturity; the fish generally destroy the mussels; they eat them up, and there are also a lot of "five fingers" that get among them. The supply of mussels on our English coast is taken from where at the ebb the ground is dry. We get our chief supply from Holland, as well as shrimps.

13,444. Do you also deal in mussels?—That is in our line; mussels, winkles, and whelks.

13,445. Where does the supply of whelks come from?—We get them from Ramsgate, Whitstable, Harwich, and Grimsby. Those are the four places we get the most from. In the summer time several boats go out from Queenborough trotting for them the same as for cod, not with hooks, but with crabs. They threddle 20 on a snood and bring them on to the hook. The whelks suck every bit of the crab out, and when you bring up the line it is as full as it can hold.

13,446. Does the supply of whelks keep up?—Yes.

13,447. It is a regular supply?—We make it our study to have a regular supply. My son is in that particular business, and all we want is a regular supply.

13,448. Are they caught from a boat or from the shore?—They are caught with long lines in deep water.

13,449. I thought they were caught on the shore when the tide fell?—Only a very small portion; nothing goes to London that is picked up in that way.

13,450. The main supply is caught?—Yes, either by dredging or trotting. We have an agent at Grimsby who supplies the cod smacks. We have some little vessels that go expressly for whelking.

13,451. Are they used as bait by the line fishers?—Yes.

13,452. Is any considerable proportion of the supply that comes to London used in that way. In the winter, when we have a supply in London, and the wind is blowing a gale on the coast, we send a great many to Grimsby for bait. The Great Northern railway allows us the privilege of sending down a quantity by the fast trains. They can get them at Grimsby by 8 in the morning. It is of great advantage to the smack owners and also to the railroad themselves, because if the fishing boats don't get bait they can't fish.

13,453. Whelks are also largely eaten in London?—Yes.

13,454. Is there no means of ascertaining the quantities that are supplied to the London market?—I did prepare a statement on paper for a gentlemen who took a great interest in shell fish, and who wrote a book upon marine animals.

13,455. Did you get the information you gave him from the other dealers in the trade?—We can tell pretty well ourselves in that business.

13,456. Perhaps you can give us the same information?—I think I can do so.

13,457. Can you draw any comparison between the quantities now supplied and those supplied in former years, together with the prices?—Yes.

13,458. (*Mr. Caird.*) Will you be able to furnish us with a return of that kind?—Yes, I shall be glad to do so as nearly as I can estimate it.

13,459. (*Mr. Lefevre.*) Can you give us a return with regard to the perriwinkles, and with regard to other shell fish?—Yes, mussels, winkles, and whelks.

13,460. The oysters are a different branch of the subject?—Yes.

13,461. With regard to shrimps, can you give us the same information?—Yes.

13,462. How is it with regard to prawns?—They are only caught at particular places on the south coast of England.

13,463. They are comparatively a very small trade?—Yes, very small. During this last winter they fetched as much as 10*s.* or 12*s.* a lb.

13,464. (*Mr. Caird.*) Where is Queenborough?—In Kent, a few miles from Sheerness.

13,465. You referred just now to an answer given by a previous witness in reference to trawling in the bays. You said that if that was prohibited it would be an injury to the shrimp fishing?—Yes, they trawl for shrimps, and I understand that in the term bays you include the mouth of our river—the Thames.

13,466. Is it only in the mouth of the Thames they trawl for shrimps?—They trawl as far as the Foreland from Orford-ness.

13,467. If that were excluded it would not do any harm?—It would throw out some hundreds of fishermen.

13,468. But if, within the points to which you refer, from Orford-ness to the North Foreland, trawl-fishing for shrimps in the bays were excluded from any regulations to be adopted hereafter, would that not leave shrimp fishermen free to get the fish usually sent to the London market?—They only trawl for shrimps.

13,469. If within the points you refer to they were excluded from any regulations hereafter adopted with regard to trawling in the bays, would that be sufficient to prevent any damage being done to the shrimp-fishing in the Thames?—That would be sufficient space for them from Orford-ness to Dungeness.

13,470. In trawling for shrimps in the bays, do trawlers bring up any other kind of fish in any quantity; I mean small immature turbot or soles, or any other kind of fish?—I have seen them bring up small fish when the spat of the mussels has come up; but the fishermen throw it over alive; they don't keep it until it is dead.

13,471. Would not many of these small fish be destroyed by the very act of being taken on board or being thrown overboard in consequence of their being

BILLINGSGATE.

J. G. Baxter.

18 Nov. 1863.

so very tender?—I think not. I have seen little soles as long as my finger brought up.

13,472. Brought up in the shrimp nets?—Yes, occasionally.

13,473. Is that system of trawling for shrimps confined to the mouth of the Thames?—It is practised from Dungeness to Orford-ness.

13,474. Is it not practised in other parts of England?—Yes, in the Wash.

13,475. Wherever shrimps are found in any quantity that system is practised?—Yes.

13,476. Then any regulation that would interfere and prevent trawl-fishing in the bays would operate injuriously upon the shrimp-fishing everywhere?—Yes.

13,477. (*Mr. Lefevre.*) In fact, in most of the bays and open places like the Wash, you find that shrimping is carried on to a considerable extent?—Yes, wherever there are flat sands. That accounts for the quantity we get from Holland. We also get a few from Scotland.

13,478. Do you get any from Southampton Water and the Isle of Wight?—No, we send down to Southampton and Brighton.

13,479. Do you supply Brighton largely with shellfish?—Yes, with shrimps and winkles. We sometimes get whelks from them there; they are not much eaten there.

13,480. Then in fact large quantities go from London to seaport towns?—Yes.

13,481. Even to places where they were caught?—Yes.

The witness withdrew.

W. Jennings.

William Jennings called and examined.

13,482. (*Mr. Caird.*) I believe your business is chiefly in shell-fish?—Before I answer the question I should like to ask one. What am I sitting here for?

13,483. In order to give us information?—But what for?

13,484. For the benefit of the public?—And of the fisheries too?

13,485. Yes.—That is all I want to know; ask me anything you like.

13,486. Are you a fish salesman in the London market?—I am.

13,487. Are you chiefly engaged in the shell-fish trade?—Not in that particularly.

13,488. Do you deal in all kinds of fish?—Yes.

13,489. Do you agree with most of the witnesses examined as to the supply to the London market being on the increase?—I think there is a great deal more than ever there was.

13,490. Do you think the increase is progressing gradually?—Yes, more keeps coming in every month.

13,491. Of every kind of fish?—Yes; during the 10 years I have been a salesman.

13,492. The quality keeps as good as ever it was?—I think it comes in better.

13,493. As to the price, has it been increasing or diminishing?—I think the price has been better.

13,494. You don't find the increased consumption in London has been followed by a diminished supply?—No.

13,495. Do you find the supply pretty closely follows the demand?—Yes, I think it does.

13,496. Then the supply keeps pace with the population?—Yes.

13,497. Is that shown by the price it fetches?—It fetches quite as much as ever it did, according to quality.

13,498. Do you agree that the largest proportion of the supply of fish comes from the trawl-vessels?—Yes, there is more trawled fish coming in than ever.

13,499. Is the largest proportion of fish that comes to the London market trawled fish?—Three parts out of four are trawled fish.

13,500. It is more than what is obtained by hooking?—Yes.

13,501. Do you agree generally with what we have heard from the previous witnesses?—Yes. I was 22 years a fishermen myself.

13,502. Can you suggest anything which can afford us additional information? If you can we shall be glad to hear you?—Mr. Hewett was talking about a regulation prohibiting trawling in the bays not interfering with the trawlers. It would not with the regular trawlers; but there are a large number of people with large families earning from 1*l.* to 2*l.* a-week who are catching shrimps off Dungeness, Rochester river, and other places, with whom it would interfere very materially.

13,503. These men are engaged trawling in the bays?—Yes, I was the first that put a shrimp net overboard at the North Foreland, and I have sold fish at Margate jetty for London.

13,504. In your opinion would any regulation prohibiting trawling in the bays be injurious to a large class of the fishermen?—Not a bit in the world. It's not the trawling that does the injury; if anything it's the men themselves who do it.

13,505. South of the Foreland is there a great deal of trawling in the bays?—In Winskett Bay, on the back of the hook, in Queen's Channel, and in Prince's Channel.

13,506. In all these bays there are trawlers?—Yes, little boats of 15, 16, or 18 tons, carrying a man and a boy.

13,507. Have you observed whether they catch other fish besides shrimps?—I have been at work and have got a few little plaice; but when you get the shrimps on deck you sift them; you put the shrimps in a sieve and put the others overboard alive. I have got from 40 to 50 bushels of shrimps in a day.

The witness withdrew.

The inquiry was then adjourned until Saturday, the 21st of November, at Lowestoft.

LOWESTOFT.

B. M. Bradbeer.

21 Nov. 1863.

Lowestoft, Suffolk, Saturday, 21st November 1863.

Present:

James Caird, Esq., M.P. (Chairman). | G. Shaw Lefevre, Esq., M.P.

Benjamin Masterson Bradbeer called and examined.

13,693. (*Mr. Caird.*) You are a fish salesman in Lowestoft?—Yes.

13,694. Have you been long in that trade here?—Yes, since 1849 or 1850. I am not exactly sure which, but I think since about 1849.

13,695. Then you have had experience in the fishing trade during the last 13 years?—I have.

13,696. In your experience during that period of 13 years has the quantity of fish taken here increased or diminished, or has it been stationary?—To what kind of fish do you allude; do you mean herrings?

13,697. I speak generally of all kinds of fish that are brought to this port?—Well, as regards the herring, I think there is no diminution, more particu-

larly in this voyage at this season of the year; but as regards the mackerel there is not the slightest doubt that there is a very great falling off.

13,698. Are herrings and mackerel the great staples of the fish trade here?—Undoubtedly they are.

13,699. When did the diminution in the mackerel first begin to exhibit itself?—About four years ago.

13,700. At what time of the year is the mackerel-fishing followed here?—It commences in May and finishes in the middle of July.

13,701. And has it not during these four years shown any increase of yield?—Not to my recollection, except during last year, when we had a few more, but they were lying a long way off the coast. I should say they were lying some 50 or 60 miles off, so far that they could not be got to market fresh, which happened many days, and they did not fetch a fair price.

13,702. And do you think the decrease is to be attributed to the fact that the fish have changed their ground?—Yes.

13,703. Is there any cause to which you attribute the decrease of the mackerel?—Yes; I should say that they are killed by the increase of the spring herring voyage.

13,704. Can you give us any proof of that?—I think there is a very good proof of that here. I have brought with me a sample of one of the spring herring nets, to convince you of the kind of nets that are used, and I daresay that this is not one of the smallest. It runs 40 meshes to the yard. That is a sample of the spring herring net (*producing a piece of net*), and this is a sample (*producing another piece of net*) of the nets that are used at this present autumn season. I have brought a piece of each.

13,705. (*Mr. Lefevre.*) What do you say that is?—This second one is a sample of the kind of net used generally at the present season.

13,706. (*Mr. Caird.*) And how many meshes are there in that to the yard?—This, I expect, would be about 34.

13,707. And the other one 40?—Yes, that is 40.

13,708. (*Mr. Lefevre.*) This one is just a little over the inch?—This one was ordered about 36 or 37 when new, but by the continual barking and using it has had since it is now up to 40.

13,709. (*Mr. Caird.*) Is that small net usual in the spring fishing?—Yes, they are all small nets.

13,710. All small nets?—Yes, because it is of no use to have large ones when you see how remarkably small the spring herrings are fished.

13,711. Is there much mackerel killed at the time the spring herring are fished for in those small nets?—In my opinion the mackerel are meshed or partially meshed by those small herring nets, and killed on the spot; consequently they do not come to maturity, and that no doubt injures the mackerel season.

13,712. And they are not brought to shore at all?—They strike our small nets, and are not brought to shore at all.

13,713. Do you think a great many of them are injured in that way?—As far as the small mackerel are concerned, the smaller sized fish that strike those nets are meshed and brought in, which proves that the spring nets catch those small mackerel; but many of them are seen by the fishermen to strike the nets and fall, and consequently they are lost.

13,714. And do you think that that is so great a loss that the mackerel-fishing is injured in that way?—Yes, I do think so, from the reports I have heard from the different fishermen.

13,715. Has that spring herring-fishing existed any longer than the four years to which you refer?—I think the spring herring-fishing commenced about a year or two after I commenced as a salesman.

13,716. (*Mr. Lefevre.*) That would be about 12 years ago?—Yes; I think about 11 or 12 years ago.

13,717. (*Mr. Caird.*) Then, for about eight years, was there no apparent injury sustained to the mackerel-fishing?—Yes; I can give you a fact in proof of it. I have in the old market sold as many as five and six lasts of mackerel in a day, whereas now we should think it almost the produce of a season to have such a quantity. The boats used to go out of a night and bring in some 2,000 or 3,000 mackerel each; now they cannot do that; the mackerel are driven over to the other coast.

13,718. That is not exactly an answer to my question. I asked you whether for a period of eight years during which the spring herring-fishing continued from the commencement any marked diminution in the mackerel-fishing had been observed?—Yes; we have observed a diminution.

13,719. I asked you that because you had said the diminution only began about four years ago?—A marked diminution in the catch of mackerel began to take place about four years ago; but the spring herring catch has been going on for more than 10 years; but still we did not observe a great diminution in the mackerel until about four years ago as near as I can recollect.

13,720 But if the spring herring-fishing had been continued for eight years and no diminution of the mackerel was observed until after then, and that diminution was only observed for four years, would it not lead to the conclusion that the spring herring-fishery might not be the cause of the falling off in the mackerel-fishery?—I think the fish have fled from the coast in consequence of the prosecution of the spring voyage stopping them in their progress.

13,721. The size of this net seems to be just an inch from knot to knot, which is the legal size?—If you try the mode in which they are generally measured and run it along the yard measure I think you will find that it will run up more than that.

13,722. With regard to the spring herring-fishing, will you be good enough to tell us something of its history and of its produce?—I will endeavour to do so as far as my memory serves me. I think about 10 years ago we had not above 20 or 30 boats prosecuting the spring herring voyage, but at the end of the 10 years, taking it up to last year, there would not be less than 150 and from that to 200 boats employed in the spring herring-fishing. I think I am about correct in that answer. And again, the length of the nets, the depth of the nets, the quantity of the nets carried in the boats, are also much increased, and the boats are much larger that are sent out to catch the fish.

13,723. Do I understand you to be speaking exclusively of the spring herring voyage?—Yes. Where they were carrying 10 years ago something like from five to six score nets of about 20 yards on the rope they are now carrying eight and nine score nets of 23 and 24 yards on the rope, and in some instances there are 100 meshes more depth in the nets now than in those they formerly used, and as to the quantities, they are enormous.

13,724. Could you give us any comparative quantities, showing what they were 10 years ago for the season and what they are at the present time?—I could not give quantities for the season, but I can tell you what they were some days. For instance, sometimes we would have perhaps 50 lasts in, whereas on other occasions I have known as many as 130 lasts to be landed, loaded, and sent away to the markets inland in one day.

13,725. Have you known that recently?—I have known it within the last three or four years, or something like that.

13,726. Then it has become a large trade now?—Yes; but I think we have not had quite so many fish these last two or three seasons as we had three or or four seasons previously.

13,727. To what do you attribute the falling off that has taken place of late?—Well, I think the weather has something to do with it; the state of the winds has something to do with it.

13,728. Has the price of fish anything to do with it?—As to the price of fish, I have sold those spring herrings at 2*d.* a hundred for manure, and they have

LOWESTOFT.

B. M. Bradbeer.

21 Nov. 1863.

been sent away in trucks and sold in the country farm yards for manure.

13,729. Is it the same class of fishermen who are engaged in the fishing, spring, summer, and autumn ?—Yes.

13,730. And do they fish in the same boats ?—Yes, many of them do; but they change their crews each season. Still, they are the same class of men.

13,731. The same class of men who live here ?—Yes; they are men from this neighbourhood who man the boats. The masters go year after year.

13,732. And do they realize a large sum of money altogether by the prosecution of this spring herring-fishing ?—Well, sir, I have known them to raise only about 40*l.* or 50*l.* in a boat for the season, and I have known them to raise as high as 500*l.* or 600*l.*

13,733. By the spring herring-fishing ?—Yes.

13,734. For one boat ?—Yes; but I have not known that done lately.

13,735. Can you give us some information about the summer herring-fishing ?—I think I can.

13,736. But before we leave the spring herring-fishing, can you tell us what is the quality of the fish ?—The quality is most inferior, and I think the fish are not eatable, and not healthy.

13,737. Where do they go to market with them ?—All over the country; and very often when they reach their destination they are seized and thrown away.

13,738. Still, on the whole, they must pay, or they would not be taken into the country ?—I do not think they do pay, except it be to the railway company who convey them. Suppose I sell a last of spring herrings at 6*d.* a hundred, which is 50*s.* a last, the railway company would get 2*s.* 6*d.* for landing only, and they would get the same proportion per ton for carrying an inferior quality of fish as they get for carrying fish that will fetch 5*s.* a hundred.

13,739. At whose risk are they sent to market ?—At the sender's risk generally.

13,740. Are the senders fishermen ?—No, they are the buyers.

13,741. But the fish buyers must have a profit, or they would not continue to buy the fish ?—I suppose so.

(*The Secretary.*). This net (*one that had been produced by the witness*) is hardly an illegal net.

(*The witness.*) I was not aware of that. I got that from a fisherman.

13,742. (*Mr. Caird.*) I think the question I put to you just now was, who forwarded the fish to market ?—I regret to say that the salesman stands as a medium between the catcher and the buyer. The buyer speculates, and sometimes it happens that the speculation is a losing one, and he does not pay; the consequence is that we are the losers.

13,743. How long does the spring fishery continue ?—It begins in the middle of March, and generally ends in the first week in May.

13,744. Then the period is about two months ?—That is about the time generally.

13,745. And are we to understand that you as a salesman think that the spring herring fishery is not a profitable fishery to anyone engaged in it ?—I believe it not to be profitable, and I also believe it to be very injurious to the next season.

13,746. But it appears that not only the number of boats, but the size of the nets and everything engaged in that spring herring fishery have increased about sevenfold in the last 10 years ?—Yes, that is so.

13,747. Then surely that increase must have been in consequence of the spring voyage being found an advantageous one ?—No; those larger boats were not built in consequence of the spring herring season, but for the purpose of prosecuting the North Sea fishing as well as the home fishing, and going out long distances on their own fishing. And, so far as the nets are concerned, many of the nets used in the spring herring voyage are most inferior nets, that have been used at the end of the voyage in catching the shotten herring.

13,748. Then your opinion is that the prosecution of the spring herring-fishing has been injurious to the summer fishing ?—Undoubtedly; I think it has been injurious to a very serious extent.

13,749. Will you be good enough to explain how that is, and how you can show that to be the fact ?—Yes. My opinion is that the spring herrings when first caught are very small fish. At the time they are caught the weather is cold, but week after week as the weather gets warmer and the season advances, we find that the fish as they are brought in improve very much, until at length they become very fine fish indeed. Well, then they drop off, the fishermen catching next to nothing at all, and after lying up for a little while they begin again in the midsummer season, and at the end of the midsummer season the fish are very much better than they were at first.

13,750. (*Mr. Lefevre.*) Is there only an interval of one week between the spring and summer herring-fishing ?—Sometimes there is only a week, and sometimes a fortnight. Sometimes, as the spring boats have finished their voyage, others will be putting in their large nets to commence their midsummer voyage.

13,751. (*Mr. Caird.*) Do you think that they are the same class of fish that are caught in the spring and in the midsummer voyages ?—I do.

13,752. That the midsummer fish are the same as in the spring, only in a further advanced state ?—Yes; in a further advanced state. They fatten every day, and you may see them.

13,753. You say that the summer fishing has considerably declined in consequence of the prosecution of the spring fishing ?—Yes, I do.

13,754. Can you give us a proof of that ?—I can. I was looking through my books last night, and I find that latterly the average has not been more than 20*l.* or 30*l.* per annum, while some years ago it was about 250*l.* per boat, but certainly over 200*l.* per boat.

13,755. Would you say from your experience that as the spring fishing has increased the summer fishing has decreased ?—Yes.

13,756. That as the spring fishing has increased the other has decreased ?—Well, as far as the spring herring-fishing is concerned, for the last two years there were not quite such large quantities as there were some years previously; but there is no doubt that the midsummer fishing has very much decreased in consequence of the spring herring being caught.

13,757. Is the summer herring-fishing prosecuted in the same boats as the spring fishing ?—A great many more boats enter into the midsummer fishing, because they are a smaller class of boats, and have not to go so far to catch the fish.

13,758. Can you give us any figures as to the number of boats ?—I think there were nearly 300 sail in the last summer season.

13,759. Do you know what the number was five or six years ago ?—About 200, or nearly 200. Some of them were strange boats—boats not belonging to the place.

13,760. Then, as measured by the number of boats, the summer fishing would appear to be progressing ?—No, some of them are employed in fishing for mackerel as well as herring.

13,761. Are the mackerel caught at the same time as the summer herring-fishing is prosecuted ?—No, but they sometimes fish side by side with each other, or thereabouts.

13,762. Is the summer fishing on the whole a very valuable source of revenue to the people here ?—It would be if it were anything like what it was four or five years ago.

13,763. Is it is not so great now as it was then ?—No, not a fifth as good, when there are so many more boats employed in it.

13,764. And do you think that any restriction, either on the spring fishing, or in the imposition of some regulation by which the nets should be used of a smaller size in the summer time, would increase the summer catch ?—Yes, I do.

13,765. In what way do you think it would produce that result?—In the first place, I think they should not be allowed to go out so early to catch the spring herring, and in the next I do not think they should be allowed to carry so many nets.

13,766. In what way would you regulate the number of nets?—If a boat were to carry only three score nets, instead of eight or nine, they could not catch the same number of fish they catch now.

13,767. But that might be got over by having two or more boats?—Then you might restrict it in another way by compelling them to have the mesh of the net larger. I know that there are parties in this town who have been fishing for spring herring with nets that have run as many as 40 meshes to the yard. I recollect an instance in which 39 meshes to the yard were ordered, for I sent the order myself.

13,768. If the legal mesh were to be enforced would that remedy the evil?—They could not then catch the spring herrings, for if the meshes were made larger the fish would go through.

13,769. Do you think that if the legal mesh were to be established for the spring herring-fishing that that would be a sufficient remedy for the evil of which you complain?—I do not know whether it would be sufficient to remedy the evil, but I think it would go a long way towards it.

13,770. With regard to the autumn fishing, how has that progressed in your experience?—It has increased.

13,771. Have you any facts to state as to the gradual progress of the autumn fishing?—There has been a larger number of boats employed, and a larger number of fish have been caught.

13,772. What is the number of boats employed in the autumn fishing now, and what was the number 10 years ago?—Ten years ago I should think there were not above 70 or 80 sail of boats so engaged. At the present time, if I recollect rightly, there are 198, or something like that.

13,773. Are the boats of the same size and class?—They are various. Some have been speculating in the half-and-half boats, and others in the large class boats, some for the purpose of fishing in the North Sea, and others for the purpose of fishing at home.

13,774. There are no open boats employed in the herring-fishing, are there; I mean undecked boats?—There are very few. There are a few here now, Scotch boats, large boats, but in two instances they have had decks put into them since they have been here.

13,775. Can you tell us anything as to the quantities of spring herrings caught here some years ago and the weight caught now in the autumn season?—I think you would get that statement better from the Harbour Dues Office and the railway company.

13,776. With regard to the price, has that increased or has it diminished on the average?—The price, I think, has been about the average, but this season and last season it was below the average, in consequence of the large quantities caught and the bad state of the markets.

13,777. Is the price of the autumn caught herring this year and of the autumn caught herring last year lower than it was some years ago?—Last year it was much higher than this year, and that has arisen partly from the great plentifulness of the fish and the bad state of the midland counties, where the fish are sent.

13,778. Where are they sent?—They are sent to Manchester, Birmingham, Bradford, Leeds, Halifax, Liverpool, and other inland towns. They are sent over the railroad as far as Scotland, the West of England, and everywhere where they can be taken by rail.

13,779. The Yorkshire markets are good, are they not?—Yes, but they are glutted with herrings.

13,780. But I understand you to attribute the prices of late to the want of employment among the people in the manufacturing districts. We are led to believe that in the Yorkshire manufacturing districts the people are well employed, and have good wages. Do you find the prices just as low there as in Manchester?—I believe they are not quite so low there.

13,781. Is there a better market there than in Manchester?—There is not a better market; there is not the demand. Manchester, Birmingham, Bradford, and those places take off an immense quantity. Such a place as Manchester will take as many fish in one day as would suffice for all the other northern markets for several days.

13,782. Taking the period over which your experience extends, will you tell us whether there has been on the whole the same steady price throughout, or has it been rising and falling in the last 10 years during your knowledge?—I should say there has been a steady price.

13,783. That it has been much the same on the average, throughout?—Yes, till we come to the enormous quantity which gluts the markets.

13,784. There is no falling off whatever in the supply of fish here?—No. I think there is a very good proof of that in the enormous quantities of this season.

13,785. Is your autumn fishing the most valuable—the fishing you have at this season of the year?—Yes.

13,786. Does the autumn season yield more money than the other two?—Yes, because there are a great many more employed in it; a great many more boats are sent out to prosecute the voyage, and they go down afterwards to the Yorkshire coast, and work their way up to their own coast. Thus they continue the voyage from the latter part of August until the second week in December, some of the large class of boats.

13,787. (*Mr. Lefevre.*) How many boats do you sell for?—Do you mean this season?

13,788. Yes, this season?—I have not counted them, but I think between 70 and 80.

13,789. Have you sold for the same number this spring season?—No; between 40 and 50.

13,790–1. And this summer season?—Oh, as many as 130, 70 and 80 boats in a day.

13,792. Do you sell for the same boats, season after season?—Yes.

13,793. Have you any means of drawing a comparison between the takes of the same boats in the different seasons?—I could tell you by referring to my ledger.

13,794. I think you stated a little while ago that in the spring fishing you have known boats to make as much as 500*l.* or 600*l.* in the season?—I have known that in one or two years.

13,795. Were those what you would call exceptional cases?—Yes; I did not say one or two boats, but one or two years.

13,796. Was that in consequence of the price of the fish being very high?—Yes, and the scarcity of fish in other markets. When the catch elsewhere falls off it is the better for the spring herring-fishing.

13,797. When you have known the amount realised per boat to be only 40*l.* or 50*l.* for the season has that been in consequence of the great take of herrings and the quantity in other ports?—Sometimes it has been in consequence of the take and the price being very low, and sometimes it has been in consequence of the scarcity.

13,798. To what distance from the shore do the herring boats go in the spring time?—They go about 50 or 60 miles off at the commencement of the season.

13,798*a*. As the season advances do they come nearer in-shore?—Yes, certainly. They commence about 50 or 60 miles off, and they finish something like 8 or 10 or 15 miles off.

13,799. Can you tell us the quantity of fish that you yourself have sold as manure?—Many tons.

13,800. And the price?—I could tell the manure price by referring to my ledger.

13,801. I should like to know the quantity you have sold in each year as manure?—I could not give you the quantity from memory.

LOWESTOFT.

B. M. Bradbeer.

21 Nov. 1863.

13,802. But you can give us that afterwards?—I can tell you that afterwards.

13,803. And also the quantity of fish you have sold to be sent to the markets?—Yes; I can give the quantities.

13,804. Can you say whether the amount you have sold as manure forms any large proportion of the whole quantity you have sold in the spring season?—The time we have generally been compelled to sell fish for manure has been about Good Friday, when everybody in the midland counties is holiday-making. It is of no use then to send fish to the markets, and on a Good Friday many a score of lasts have been sold for 2½*d.* a hundred, while others have been taken away for manure.

13,805. Then they have been sold for manure not because they were of an inferior quality, but because there has been no demand for them in consequence of the holiday-making?—Many have been sold for manure because they have been brought in on the second day instead of on the first day.

13,806. Because they were not fresh?—Yes.

13,807. I think you said just now that the fish went on improving as the spring season went on?—Yes, undoubtedly they improve as the weather gets warm.

13,808. Then at the end of the spring season they must be as good as they are at the beginning of the midsummer season?—So they are, and they make almost as good a price.

13,809. Then if you were to propose any legislation upon the subject, would it affect the whole of the spring season, or only the beginning of it?—I think if the boats were not allowed to commence the spring herring voyage until April instead of March and were to be compelled to have nets of not more than 36 meshes to the yard, and likewise were only allowed to carry a certain number of nets, it would improve the fishing.

13,810. Can you tell us how many boats go out from Lowestoft—boats belonging to Lowestoft—for the spring herring season?—Something considerably over 100.

13,811. Can you tell us the number of boats coming from other ports to Lowestoft during the spring voyage?—We have sometimes 15 or 20 from Gorleston and Yarmouth.

13,812. Do any foreign boats come here?—Why we call those foreigners.

13,813. I do not mean them. Do any French boats or Dutchmen come here?—The Frenchmen come in the spring season and the Dutchmen come in the spring season to buy fish for bait.

13,814-5. Do you think you would have foreign boats coming and fishing five miles off the coast, catching the fish and bringing them into market here?—That is a question I could not answer.

13,816. Outside the three miles they may catch the herring. Suppose any regulations were made prohibiting our boats from going out in the spring season and fishing in the way they now do, would not the French boats and the Dutch boats come off the coast and catch fish outside the three miles, and then bring the fish so caught into our markets for sale?—They would do nothing of the kind, sir, because at the time the French boats come over here they come for bait, and it would not answer their purpose to fish for the bait. I believe there is another reason why the Frenchmen would not come, and that is, because their boats are three times the size of ours, and they have on board as many as 25 and 30 hands, so that that kind of fishing could not possibly pay them.

13,817. Do you produce this net as an average net used by the fishermen in the spring herring season?—That is a net used by one of the owners in this town who has two boats.

13,818. Did you bring it here as a sample of the nets that are used here in the spring season?—I did.

(*The Secretary.*) He brought it here at my request.

(*The Witness.*) Yes, I brought it at your request.

13,819. (*Mr. Lefevre.*) I think you also stated that you have known cases of nets being used of a smaller mesh, and that you yourself have ordered a net of as many as 39 meshes to the yard?—Yes, I have.

13,820. And I suppose you are aware that that is an illegal mesh?—Well, as regards the illegality of it, I was not aware that there was an Act extending so far as Lowestoft and the east coast which regulated the herring voyage; I thought it only extended as far as Ramsgate.

13,821. Can you tell us the proportion of the nets used in the spring season in which the meshes are beyond the legal number?—It would be impossible for me to tell you that, because I do not go on board the boats to measure them, nor measure them on shore.

13,822. Can you tell us what proportion of the boats you sell for in the spring season use nets that are within the legal mesh?—I cannot tell you that, sir. I know that I have ordered many hundreds of nets for the spring catches at 36 and 37 meshes to the yard.

13,823. In how many cases have you ordered nets of 39 and 40 meshes to the yard, or beyond that number?—Only one.

13,824. Are the nets in the midsummer season larger than the nets used in the spring season?—Oh, yes; much larger.

13,825. And for the autumn season, what size are they?—32 and 33 meshes to the yard, and in some instances 34.

13,826. What interval is there between the midsummer fishing and the autumn fishing?—From the second week in July to about the first week in September.

13,827. What distance do the boats go from the coast at the end of the midsummer season?—Only a very short distance; a few miles.

13,828. At what distance are the fish found in the beginning of the autumn season?—Sometimes the first fish are struck at the back of the Gabbard; more or less than 20 miles distant north-east, and about the same south.

13,829. Have you observed any relation between the extent of the autumn fishing and the extent of the summer fishing?—I believe they are a different quality of fish, and for this reason: going back to the spring season, we find the fish gradually improve; they improve by fattening, and have a fat gut in them; but the first herring generally caught in the autumn season are small full herrings, full of spawn; consequently they cannot be the same herrings as the midsummer herrings.

13,830. Does not a net after it has been used for some time shrink, and the meshes become smaller?—Yes, certainly they shrink up.

13,831. So that a net of 39 meshes to the yard will become in course of time nets of 41 or 42 meshes to the yard?—Yes, certainly they will shrink up as much as three meshes.

13,832. How long do the nets last?—That depends a good deal on the take of herrings and the amount of destruction they meet with, which is sometimes considerable during the fishing.

13,833. But how long on the average?—I should think about two years. In some instances I believe they have been kept, with care, as long as four years.

13,834. Do the fishermen use different sets of nets for the three seasons?—Partially so; not wholly. Some of the nets on board of the boats at the present time used in catching the small shotten herring are similar to those used in the spring, and some of those used in the spring are used now.

13,835. Is there any Government officer who inspects the nets here?—No, sir, not to my knowledge.

13,836. Have you ever known any case in which nets have been seized as illegal?—There have been no such seizures to my knowledge.

13,837. Is there any Government steamer off this coast to look after the fishing boats?—No; but I think it would be a very desirable thing to have one.

13,838. Do the Frenchmen fish off this coast?—I believe they fish higher up; a certain distance off the Foreland. They don't often come here.

13,839. Why would it be desirable to have a Government steamer off here?—Because I think that the fishing smacks and the Frenchmen sometimes interfere with our boats, and our people find their nets cut through occasionally—sailed through and destroyed; and if there were a steamboat on the look out the person doing this might be detected.

13,840. Is it when they are fishing off the Foreland that they meet the French boats?—Our boats sometimes go as high as the Foreland to fish themselves.

13,841. Is it at that time that these things occur; is it then that the Frenchmen cut through their nets?—I think when that kind of thing happens it is among the trawling smacks more particularly. The trawlers sail through the nets, and sometimes steamboats and other vessels sail through them, destroying three or four, and sometimes more nets at a time.

13,842. Do you sell also for the trawlers?—Not often.

13,843. (*Mr. Caird.*) I see there is an ice-house being built here; is that a new thing? Has there not formerly been some depôt here for supplying the trawling vessels?—There was a small one.

13,844. Is there expected to be, or is there now, an increase in the quantity of fish brought into Lowestoft which it is necessary should be provided with ice?—I am not aware that the quantity is increasing to the extent of the provision that has been made, but I believe arrangements are being made with the fishing smacks which come here.

13,845. It seems to be a provision for an expected increase in the trade; is it not so?—I suppose so; but I do not know what the company's ideas are in building such a monstrous place.

13,846. How are the herrings disposed of? In what proportion as fresh herring or as pickled herring, or in what other way are they sent to market?—At this season of the year some are sent away fresh to London and other markets; others are slightly salted in barrels; many truck loads are sent in trucks to various parts, and hundreds of lasts are being put into tight casks for pickling for the winter season and the early part of the year.

13,847. Are they dried in any way or are they salted?—A great many of them are smoke-dried with billet wood. Some of them are sent to market only slightly cured—only hung up for a few hours, and others are dried for a fortnight or three weeks.

13,848. In what proportion are they sent in those different modes to market?—As far as Lowestoft is concerned a much greater quantity of green fish is sent away from here than of cured fish.

13,849. "Green" fish I suppose are fresh, or only slightly pickled?—We call all "green" fish that are not smoke-dried. We do not export from here the same as Yarmouth does, sending out vessels with 2,000 or 3,000 barrels at a time.

13,850. Your trade is almost entirely with the inland country?—More particularly.

13,851. What proportion do you think goes to London of the whole supply?—Not a twentieth part; I may say scarcely a fiftieth part.

13,852. Then London does not form the great market for the consumption of your fish?—There is a great deal sent to London, but it is a dangerous market to send to, and they do not like to risk it. Birmingham is a better market on the average than London.

13,853. I think you stated that Manchester was your best market?—Yes, for the inferior quality of fish.

13,854. Then Lowestoft may be looked upon as supplying more to the midland towns than to London?—Yes, more, certainly.

13,855. (*Mr. Lefevre.*) Where does the main quantity of the spring herring go to?—Into those largely populated towns that I have already mentioned, such as Liverpool, Manchester, Leeds, Bradford, Halifax, &c.

13,856. Do any go to London?—Yes, a few, but not a great deal.

13,857. And is it really your opinion, seeing that from 150 to 200 boats are employed in the spring fishing, that it pays nobody in reality but the railway company?—I believe they are the parties who get the most money out of it; they are paid both for landing dues and for carriage.

13,858. Do you yourself get paid by the last?—Two and a half per cent., and I have to pay all the expenses out of that, and run the risk of the money. Sometimes we lose as much as 150*l.* at a time.

13,859. Have you found it a losing trade to yourself?—I have to a very serious extent.

13,860. Are you ready to give up that branch of your trade?—I do not say I am willing to give it up.

13,861. Can you tell us the size of the spring fish?—Some of them are larger than others.

13,862. But I want to know the general size, the average size?—I suppose about 9 or 10 inches in length.

13,863. And as the season goes on does it increase in size?—Oh yes, it grows to a very fine fish, very fat and thick in the back. If you open the spring herring you will find nothing at all in it, and there is no flavour in it when it is cooked, but as the season goes on and the warm weather comes in you will find that the fish continue to get better and better until they become very fat, fine, and full flavoured.

13,864. Can you determine any particular period at which it would be desirable to commence catching the spring herring?—That is asking me a question upon which I think you ought to hear the evidence of some other person as well as myself. I have already given you my opinion upon that point.

13,865. You have expressed your opinion that some regulations should be adopted with regard to the spring herring-fishery; I now want to know what are the regulations you would suggest?—I think I have already stated that they should not be allowed to commence the spring herring-fishing so early, that they should not take so many nets, and that the number of meshes should be restricted to 36 to the yard.

13,866. At what time in your opinion should the spring fishing commence?—Instead of commencing in the middle of March I think it ought to be commenced in the middle of April or the latter end of April.

13,867. At the latter end of April are the fish as well worth catching?—They are better in quality.

13,868. With regard to the quantity of nets used, do you think it would be of advantage that there should be Government inspection for the purpose of seeing that each boat does not carry more than a certain quantity of nets?—I think that that would be a very good plan, but I forgot to mention one thing which I think will show whether the spring fishing answers the purpose of the catchers or not. I recollect that a few years ago persons would order whole fleets for the spring herring season, but gradually as the nets were worn out and the seasons were not found so profitable they ordered no more, and then instead of that there would be two parties and sometimes three parties to net one boat. If it had answered the purpose of all parties they would have gone on ordering the nets for that particular voyage.

13,869. How many boats went out this season for the spring herring season?—I should think from about 150 to 160; that is as near the number as I can tell you from memory.

13,870. Do you think if any regulation were to be made reducing the number which the boats take out that that would induce boats not to go out? Do you think that that would decrease the number of boats sent out?—I think it would most likely decrease the number of catchers, and therefore it would decrease the number of fish caught.

13,871. Do you think that in that case the fish that would be caught would realise a higher price?—Decidedly I do. In the best season that ever was made the fish mostly averaged 1*s.* a hundred. That is the best season that ever was made to my recollection.

13,872. Then you think the fish would, in the case I have put, be sold for a higher price?—Yes, I do.

LOWESTOFT.

B. M. Bradbeer.

21 Nov. 1863.

13,873. The seller would get the advantage and the buyer would lose it?—The buyer does not do so well out of a glutted market. For instance, last year they did not do so well out of a glutted quantity, and this year it is a question whether they will do anything. I know many of them who have done no good at all.

13,874. (*Mr. Caird.*) On the barrelled herrings is there any trade mark?—None; only the buyer's mark.

13,875. The buyer here?—Yes.

13,876. And is that mark known in the market to which it is sent?—It is mostly, especially by large buyers.

13,877. How is the price fixed at the market, by opening the barrels and examining the herrings, or by taking the brand?—I believe the barrels are opened and the fish examined, but I think in the case of pickled herrings a sample is generally sent to some wholesale man, and he sends an order to the buyer. The barrelled herrings are not sold in the same way as the herrings that are sent daily. The herrings that are sent daily are sent direct into the market, and there is the bulk before the buyers, and they are sold from one barrel upwards. If a man has 500 barrels lying here he writes to different parties and he receives orders from them to send up so many barrels as a sample. If the samples are approved he sends on the remainder. It is not often they are sent up to be sold the same as the daily fish.

13,878. (*Mr. Lefevre.*) Do you sell for the mackerel boats also?—Yes, I do.

13,879. Have you observed the falling off in the quantity of mackerel to correspond with the falling off that has taken place in the midsummer herring?—Yes, and to such an extent that boats which formerly used to come here from Hastings, Worthing, Brighton, and places in that part of the country, and make a good season—a couple of hundred pounds—now do not come here at all.

13,880. When did that falling off first commence?—About four years ago.

13,881. Can you give us the comparative quantities of the mackerel taken?—How many years do you want the quantities for?

13,882. I should like them for 11 years?—It would take me a week to give you them all. For 10 years I could give them with pleasure, and others beside me can also give them, I have no doubt.

The witness withdrew.

J. Robertson.

JOHN ROBERTSON called and examined.

13,883. (*Mr. Caird.*) You are collector of Customs here?—I am.

13,884. Have you been long stationed here?—About 11 years and a half.

13,885. During that period your attention has no doubt been very much drawn to the progress of the fishery here?—Yes, it has.

13,886. Have you observed, on the whole, whether there has been an increase in the general yield of the fishery here, or a decrease?—There has been a large increase.

13,887. Can you give us any proof of that by any returns or any facts within your own knowledge?—Yes, I can. At the present moment the fishing luggers employed in herring and mackerel-fishing number 176, and eight smacks are employed in trawling only.

13,888. Can you show us the gradual progress that has taken place; you are now taking the present time, giving us the returns for the present period?—Yes, up to the present hour.

13,889. Can you show us what the number was last year and the previous year, and so on; can you show us what it was five years ago?—Yes; only my return is not arranged so. In 1862 we numbered something like 140 boats here.

13,890. (*Mr. Lefevre.*) Has there been an increase from 140 to 176 in the last year?—Yes, that is the number in 1862, and in the present year.

13,891. (*Mr. Caird.*) In 1862 you say there were 140; in 1863 the number is 176; so that there has been an increase of 36 boats?—Yes.

13,892. In the present year?—In the two last years; in 1862 and in 1863.

13,893. Are those boats of about the same size?—No; the boats during that period have very much increased in comparative tonnage.

13,894. Then you have both a larger number of boats and an increase in their size?—Yes, and their tonnage runs from eight tons (they are not all registered, but we have the tonnage of them; they do not require to be measured unless they are 15 tons)—their tonnage runs from eight tons up to 34 tons.

13,895. Do you know the number of men employed in the fishing; have you any record of that in your books?—There are from five to 11 men per boat.

13,896. But do you know the total number?—I have it, and can give it to you.

13,897. It would be interesting to know the total number. Can you go back for any period of years, say five or 10 years back, so as to show us what has been the gradual increase?—I have not got the information here.

13,898. Have you no means of obtaining it?—Oh yes, I could do so.

(*Mr. Lefevre.*) It would be very interesting to have a table, giving a tabular view of it.

13,899. (*Mr. Caird.*) Have you observed that there has been a gradual progress in the fishery here, spring, summer, and autumn?—I have noticed it, but I cannot go into the minutiæ.

13,900. Do you agree with the previous witness that the spring fishing has increased materially, and that the summer fishing has decreased materially within the last two or three years?—Yes, I do.

13,901. Is there any cause to which, in your judgment, you can reasonably attribute that?—No, I have not had sufficient practical experience in the matter.

13,902. With regard to the autumn fishing, has that been constantly progressive?—Yes, in my experience.

13,903. Are there any regulations at all existing just now which interfere with the fishery?—None whatever.

13,904. Is the fishery subject to any regulations as to the size of the nets?—No.

13,905. Or as to any time at which they are to set their nets?—No.

13,906. Do you imagine that any regulations of that kind would be of advantage to the conduct of the fisheries here?—I do not think they would.

13,907. Is there any interference on the part of the French fishermen?—Yes, there are a great many complaints on account of the heavier nature of the French boats.

13,908. Do the French fishermen fish along the coast near Lowestoft?—Not often, but they do at the present season.

13,909. Do they come into collision with the boats here?—Very frequently they do; when the fish are within narrow limits they come into constant collision, and the French boats, taking them as a whole, are of much heavier tonnage than ours.

13,910. The herring fishery is prosecuted generally outside the three-mile limit, is it not?—Yes.

13,911. They hardly ever catch the herrings within the three miles, do they?—No.

13,912. So that the Frenchmen do not come within the prescribed limits?—No.

13,913. They are, consequently, where they have a right to be?—Yes, under the fishery Convention. They are guided by the fishery Convention of 1843.

13,914. Does anyone on the part of the Government, by gunboats or otherwise, attend the fishermen here?—We have had some French gunboats here, I believe.

13,915. Have you had any English gunboats?—We have not had them in Lowestoft.

13,916. Do you think that such interference is desirable?—I think it is.

13,917. Do you think that such an amount of damage is done to our fishing tackle and gear as to render such interference necessary on behalf of our vessels?—I do.

13,918. Have you heard many complaints to that effect?—Yes, we have, a good many; there is never a season but we have at least one or two such complaints.

13,919. Complaints of serious damage?—Yes, by trawling vessels.

13,920. But that is not by French fishermen?—And of damage also by French fishermen.

13,921. But the trawling vessels are not those of the French fishermen?—Some of them are; some of the Frenchmen trawl.

13,922. But the complaints are against the trawling vessels more than against the Frenchmen?—They are against both; against the trawling vessels of the French, and also against the English trawling vessels.

13,923. And the regulations prescribed by the Convention have not in any way been enforced in that respect?—Why, that is rather difficult. It is not easy to get at the authors of the mischief which is generally done under the cloud of night.

13,924. (*Mr. Lefevre.*) What is the nature of the damage done?—Cutting the nets. They get foul of the nets, and the man who is strongest cuts his neighbour's nets, and separates, in many instances, a fleet of nets into two portions.

13,925. (*Mr. Caird.*) The French being heavier than the English can do that?—Yes; but the English trawlers also commit depredations.

13,926. How do they cut the nets?—They have a contrivance called a "devil," which is shaped like a scythe, put up at the stem.

13,927. Have you seen any of those contrivances?—No, I never saw one, for they take care to keep them out of sight. They go right through the nets and cut them across.

13,928. Our English trawling vessels do that?—Yes, not all, but some of them.

13,929. Did you ever see such a thing?—I have seen the fittings, but I never saw the article itself.

13,930. (*Mr. Lefevre.*) Are any of the smacks belonging to Lowestoft fitted with that apparatus?—I will not say they are clear of the thing.

13,931. Then you think there is a case of that sort here?—I think there is.

13,932. (*Mr. Caird.*) And you think they can cut the nets in that manner at night and get off without being discovered?—Yes, I do.

13,933. How is the implement fitted?—It is fitted in the same as a rudder. It goes into one gudgeon, and as it is below water it is not so easily noticed. It is sharp and can be easily shipped and unshipped.

13,934. The object of it is to cut the fleet of nets and so get through?—Yes.

13,935. (*Mr. Lefevre.*) Is it something like a knife?—There is a witness in the room who can describe it to you. I have never seen it myself, but I understand it can be put into very little compass, and be readily concealed from the officers who board the vessels. I know that such a thing does exist, and I don't know any punishment too great to visit upon a man who would make use of such a thing.

13,936. (*Mr. Caird.*) Do you think that any regulations could be adopted to prevent the injury taking place that is said to be done by the spring herring-fishing?—I am not able to answer that question.

13,937. You have not turned your attention to it?—No, there is such a vast variety of opinion upon the subject, as to whether we should prevent the spring fishing or let it go on.

13,938. Do you think it could be so modified as to become less injurious?—I am not able to speak upon that matter; there is so much involved in it that it is really a very difficult question.

13,939. (*Mr. Lefevre.*) Have you observed the same falling off in the midsummer fishing that the last witness has observed?—Yes, I have.

13,940. How far back can you trace that falling off?—I can hardly say; last year we had little or nothing.

13,941. And the year before that?—It was a little better then.

13,942. Was there a good spring herring-fishing last year?—Yes, I think we have always had a good spring herring-fishing.

13,943. Have you observed whether the take diminishes greatly as the spring herring-fishing goes on?—No, I have not noticed it.

13,944. I think you said that a great number of complaints are made to you?—Oh yes.

13,945. Can you say what number of complaints?—Two or three, or three or four in a year.

13,946. Are those complaints of loss of nets or only of the nets being cut?—Of the nets being cut; and last year one boat was lost by a Frenchman running him down when he was at his nets.

13,947. Have you heard of cases of the nets being altogether lost, or only of their being cut?—Yes, I have heard of their being altogether lost. I have a number of applications from parties at a distance, complaining of the loss of nets. I have them now. They do not say how, except that they have been cut by some one.

13,948. Do the French fishing boats come in here occasionally?—Yes, for refuge, and also in the spring herring season, to buy the spring herrings for bait for cod-fishing.

13,949. Are they off the coast now?—Yes, I believe they are.

13,950. How far south from here does the herring fishery extend?—I should imagine to the parallel of the latitude of London.

13,951. Do the boats from here go as far south as that?—Not quite so far.

13,952. As the season gets later are the fish found further south?—Yes, further north and south; it varies.

13,953. When the autumn fishing begins where are the fish found?—They go out from here and according to circumstances they go north and south.

13,954. Is there any particular rule as to the general locality of the fish?—No. Different causes, such as the prevalence of particular winds, cause a variation.

13,955. (*Mr. Caird.*) Do you think that any close time with regard to the spring herring fishery would be desirable?—Yes, I think it would.

13,956. You are of opinion that the spring herring-fishing should not be begun until a certain time?—I think such a regulation would be desirable.

13,957. Do you think that the fishermen themselves who are engaged in the spring herring-fishing would object to that?—I think that they are very anxious to have a limit put to it, or to put an end to it.

13,958. You think that the fishermen themselves can see the evil, but that as there is no regulation put into force with regard to time, one follows the other in order that none may have the advantage?—That is so.

13,959. And if some regulation were to be established you think they would all be very glad and that they would all acquiesce in it?—I do think so, and I can state that they have often expressed a wish to that effect to me.

13,960. Can you, from your own experience, say what time would be the proper time for commencing the spring herring-fishing?—No, I have not had sufficient practical experience to know that.

13,961. Is the mackerel-fishing a source of large trade here?—No.

13,962. Has it never been since you have been here a matter of much importance?—It has never been in my recollection a matter of very great importance, and it has of late been gradually diminishing.

13,963. (*Mr. Lefevre.*) Do you know how many boats are engaged in the mackerel trade here at present?—No.

The witness withdrew.

LOWESTOFT.

J. Taylor.

21 Nov. 1863.

JAMES TAYLOR called and examined.

13,964. (*Mr. Caird.*) You are connected with the fishing here?—I am.

13,965. In what capacity?—I am a fisherman myself, and a fishing boat owner too.

13,966. You are the owner of a fishing boat?—Yes, of two.

13,967. Are they large decked boats?—Yes.

13,968. For herring-fishing?—Yes. I go out myself in general.

13,969. Have you been a fisherman long?—Yes, ever since I was 13 years old.

13,970. And what can you tell us about the spring herring-fishing?—Why, we like the spring herring-fishing very well indeed. It does a deal of good to us.

13,971. Do you make much money by it?—I have always made more profit by the spring herring catch than I have made in any other season.

13,972. Do you catch more herrings?—I make more profit according to the amount of herrings we raise. It is not the quantity of herrings so much as the money they raise.

13,973. Do you catch as many herrings in the spring as you catch in other seasons?—Not so many.

13,974. Do you get a higher price for the herrings you catch then?—We raise about 15*d.* or 16*d.* per hundred; but there is a good deal of difference between the money raised by one boat and the money raised by another. One boat one year caught 36 lasts of herrings, for which she rounded 16*d.* a hundred, but another boat only rounded 9*d.* a hundred for what she caught.

13,975. And both boats were fishing on the same fishing grounds?—Yes, and carrying the same quantity of nets.

13,976. How does one boat catch so much more valuable herrings than another?—By being a faster boat and bringing her fish fresh into market.

13,977. Then there is no difference in the quality of the fish; the difference arises from the rapidity with which they are brought to market?—They are the same quality of fish.

13,978. When does the spring herring-fishing commence?—We used to commence about the 20th of March, but now we begin much sooner, about the 7th or 8th of March.

13,979. And how long does the season continue?—Right up to midsummer. There is now but very little stoppage. They stop merely for the purpose of shifting their nets and putting others in.

13,980. Then the spring and summer fishing may be said to run into each other?—Yes, about that; but the boats may lie up for a week or so.

13,981. Did you hear the evidence of a previous witness as to the very inferior quality of the earlier fish?—Yes; they are not of very good quality.

13,982. Do they become better as the season goes on?—Yes, they do.

13,983. Does the price increase also?—The price increases as the quality increases. There are very few caught at that time.

13,984. Are there only a few fish caught at the beginning of the season?—Sometimes they get a quantity at the beginning of the season.

13,985. And are they of inferior quality?—Yes.

13,986. And small in size also?—Yes.

13,987. Do you use a smaller meshed net?—Yes, about 37 meshes to the yard.

13,988. And do you increase the size of the mesh as the season goes on?—We increase it in the midsummer season.

13,989. Do you find that by the system of spring fishing you have adopted you injure the summer fishing?—No, not a mite of it. If there were not plenty of spring herrings I should not think of sending my boats to sea in the midsummer.

13,990. Do you not agree with the previous witness that the effect of the spring fishing is to diminish the yield of the summer fishing?—I do not believe it at all.

13,991. Are they the same herring?—I do not think so. There are so many opinions on that point that we cannot decide that. We know when the herrings are in the net that they are there, but where they all come from no man in the world can tell.

13,992. But you have caught smaller quantities of fish in the summer within the last year or two than previously?—Oh, yes.

13,993. Do you not ascribe that to any cause?—No, sir; only that it is the work of the Almighty.

13,994. Do you not attribute it to catching the same fish earlier in the season?—I think that fishing for spring herrings is very much like dipping a bucket in the sea and getting a bucketful out.

13,995. (*Mr. Lefevre.*) You think that they are so numerous?—Yes, in some seasons. I can give you an instance. In the year 1855 we caught a great quantity of these spring herrings, and in the same year there was a tremendous take of the midsummer herrings. The more we caught of them the more there appeared to be. We used to come in so deeply laden that we could not sell them.

13,996. (*Mr. Caird.*) That was in the summer time; but do you now find that the more you catch in the spring the more you catch in the summer?—That of course depends on the shoal that comes on our coast.

13,997. Has there not been a decrease in the summer fishing during the last four years?—There has been a decrease ever since the good midsummer we had four years ago.

13,998. Has there been the same marked decrease in the spring fishing that there has been in the summer fishing?—Not so much.

13,999. Then the summer fishing has decreased more than the spring fishing?—Yes.

14,000. Has it shown any sign of coming back again to what it was?—The summer fishing has shown no such sign. I did not send at all last summer season; but I have great faith that we shall catch plenty of spring herrings another season.

14,001. Do you think that you will ever catch the summer herrings in such large quantities as before?—If they come upon the coast we shall; of that I feel quite sure.

14,002. Is the autumn fishing as good as it used to be, or is it worse?—Why, the class of boats we have now is of a much superior quality to the class of boats we used to have. They are now quite a different thing altogether. In fact the fishing has been turned quite upside down. When I was a boy we would go out in a lugger and would not take half the quantity they take now. One of our nets now would catch as many fish as three would at that time.

14,003. One of the present nets would catch as many as three of the former ones?—Yes.

14,004. (*Mr. Lefevre.*) Has the take of fish increased in the same proportion?—The take of fish has very much increased.

14,005. (*Mr. Caird.*) In recent years?—Yes, but we used to catch a great quantity of herrings then.

14,006. Have you not observed any decrease in the autumn fishing?—In some particular years we scarcely get any.

14,007. There is a great variation in the quantities caught year by year?—Yes.

14,008. But there has been no decrease which has not been made up again, as in the case of the summer fishing?—No, I have not seen that; but last year where we caught such a body of fish, betwixt the two Gabbards, we have caught none this year.

14,009. (*Mr. Lefevre.*) Where are the Gabbards?—About E.S.E. of Orfordness. I have caught a great many lasts there, but this year there has not been a herring to catch there.

14,010. (*Mr. Caird.*) Do you agree with the last witness in the desirability of having a close time for the spring herring season?—I think that the boats go too early, and that it is not good for them to go so soon.

14,011. When do you think would be the proper time for them to begin ?—I should think the 1st of April would be about a good time to begin.

14,012. Are the fish in good condition about that time ?—They have improved, but very little then.

14,013. When do they begin to be good ?—Why, when they become very few for us to catch.

14,014. And when is that ?—Generally about the month of May.

14,015. Do you not think that if you were to let them alone till the month of May you would then have plenty to catch ?—I cannot say.

14,016. But what is your opinion as a practical fisherman ? — Why, you cannot get them except when they are there to get; and if you were not to get them in the month of April you would not get them in the month of April. I believe that, sir. When they are there it is wise to go and take them. You cannot get them when they are not there.

14,017. But still you would agree in the propriety of having some regulation by which the fishermen would not be allowed to commence the spring fishing until a certain time ?—Yes, and I think also that if our fishermen both on the south and east coasts of England were not allowed to fish on the Saturday night and Sunday night that that would be one of the wisest things that could be done.

14,018. But that would not affect the question with regard to the spring fishing ?—Yes, it would affect it very much, because the fish now caught on the Saturday night and Sunday would not then be brought in. A boat goes away on the Friday and the fish cannot be got into the inland markets before Sunday; therefore they have to wait till the Monday, and the herrings then are not fit for anybody to eat.

14,019. You think if there were some restriction as to their not fishing on Saturday nights and Sunday nights that that would be desirable ?—I think it would do a very great deal of good.

14,020. You think that that would be better than preventing them from beginning the spring fishing so early in the season ?—I think it would be very beneficial.

14,021. (*Mr. Lefevre.*) The reason you give is because the fish cannot be brought to market ?—Yes; the fish are a class of fish that must be taken to market fresh, because they cannot cure them.

14,022. You found your opinion not on the rest that it would give to the fish, but because they would be brought into market in a better condition ?—Yes.

14,023. (*Mr. Caird.*) Would any regulation as to the size of the mesh prevent the fishermen from catching fish that are not fit for the market ?—Why as to the mesh, the fact is that we cannot keep the sheal right. If I buy 60*l.* or 100*l.* worth of lint and get it made the right size, and it is inspected by Government, and then if I take it and try to preserve it it will shrink up eight or nine meshes to the yard, probably, and some won't shrink at all. Some cotton will shrink more than other cotton will in the preparing and tanning. I have known some to shrink four meshes in the yard, and some only two. I have something like 200 of the small sheal nets, and they were all got of one size, 36 going to the yard, but now you may find as much difference in the size of them as three or four meshes to the yard.

14,024. You use the smaller meshes for the spring fishing ?—Yes, the small mesh. I do not use any other.

14,025. You do not agree with what was said by the other witness, to the effect that by a regulation enforcing a larger mesh the spring fishing would be prevented from sustaining injury by the catching of immature fish that are not fit for market ?—The fish are in very good order when they are caught, but it is in getting them to market that they suffer. They are sometimes caught 40 or 50 miles away, and then if the winds happen to be contrary the very fastest of them cannot get here until the second day, and then they have to go, perhaps, a day or two's journey into the country, by which time they are good for nothing.

14,026. Is there any difference with regard to that between the summer fishing and the spring fishing ?—Yes, the summer fish we can salt.

14,027. But not the spring fish ?—Those fish are not fit to be salted. They must be sent in fresh to market.

14,028. Are you a mackerel fisherman ?—I have been in former times.

14,029. Is the mackerel-fishing a source of much revenue here ?—It has been, that is to say when we get a good mackerel season we generally get a good midsummer season.

11,030. Are you of opinion that by the spring herring-fishing you injure the mackerel-fishing. It was stated by a previous witness that the young mackerel struck the nets, and disappeared ?—I have caught plenty of young mackerel in the herring nets.

14,031. Do you think that the mackerel fishing is injured by the spring herring-fishing ?— We have never had a good mackerel season since 1854, when a very large number were caught.

14,032. (*Mr. Lefevre.*) How long have you been a fisherman ?—Ever since I was about 13 years old.

14,033. Did you gradually rise from being a fishing boy to being the captain of a herring boat ?—Yes.

14,034. And did you save money enough to buy your two boats ?—We can save money regularly; that is to say, that I have been very successful.

14,035. Are there many like you in Lowestoft ?—There are several, I dare say. We have to work very hard.

14,036. Are there many men here now who are owners of boats, and who began life as fishermen, withoutan ything ?—Yes; but a good many like myself had a start in life. A great many people can make a move in the world if they have some one to give them a little shove.

14,037. Then I suppose you had a shove ?—Yes, I was one that had a shove.

14,038. Tell me, when you begin the spring herring season, where do the boats mostly go to; where do they find the herrings ?—In the deep water.

14,039. How far out ?—About E. by N. from Lowestoft.

14,040. How far out ?—They go somewhere about 28 miles across; they go about 50 miles off in general.

14,041. Off Yarmouth ?—Yes, off Yarmouth; that is, they start off Yarmouth.

14,042. Do you go out, and spend only one night out, and come back with your fish ?—Sometimes they are out for two or three nights before they find them.

14,043. And as soon as they get any quantity they come in ?—Yes, and sometimes they come in with only half a last, or they are sure to have them spoilt so that they can only be made manure of. Frequently they do not get enough to come into port with.

14,044. The price of the herrings depends very much in the first instance upon whether you can come in and sell them fresh ?—Yes.

14,045. And if they are not fresh when they are brought in they are sold for manure ?—Yes, that is it.

14,046. And if they are fresh, they are sent off to the manufacturing towns in the Midland, and sold at the different markets as fresh herrings ?—Yes.

14,047. Have you ever known a case of fresh herrings being sold for manure ?—Yes, I have on Good Friday or holiday time.

14,048. But you have not known it at the beginning of the season ?—No.

14,049. And when they have been so sold about Good Friday, has that been from exceptional causes; from people not buying fish at that time ?—Yes. I have had 1*s.* a hundred offered to me for the whole catch of two boats for the whole season round.

14,050. For the whole spring season ?—From a certain time of the year to the finishing up in the month of May.

14,051. And does that pay you ?—Yes, because the strain on the nets is very little in the spring season.

LOWESTOFT.
J. Taylor.
21 Nov. 1863.

I have seen more young herrings caught and killed in a little boat of 14 tons in one day than we can kill in a much greater time.

14,052. When was that?—When I have been on the Lincolnshire Main. They catch them from Grimsby right up to Boston Deeps. That is in the winter season; they begin to catch them about the month of January.

14,053. After the autumn fishing is over?—Yes. I have seen those vessels come in deep laden with them. They sell them for manure at so much per chaldron.

14,054. Are those young herring?—They are all young herring, from an inch long to 3 or 4 inches, and plenty of them are not so big round as a pencil.

14,055. Are they caught purposely for manure?—They are caught for manure. They run as long as that (*pointing to a sprat on the table*), and some of them are not half so long.

14,056. That is in the month of January?—Yes.

14,057. Is it only in that month that those small fish are caught?—Yes; in January and February.

14,058. Do you ever catch fish of that size off this coast?—I have not known it of late years. They used to catch them when I was a little boy, before this new harbour was built.

14,059. When did you first begin to fish for herrings in the spring?—About the year 1855.

14,060. That was the year you had a great take of midsummer herrings. Had you a great take of spring herrings that year also?—Yes, a great quantity.

14,661. Have you observed since that year a falling off in the takes of spring herrings?—No, we generally get a good lot of spring herrings.

14,062. But since 1855 you have not had a good midsummer year?—No, but we do not expect to have such a thing as that again. It was an unusual thing, such as was never known before.

14,063. Did you go out for herrings in the midsummer season longer ago than 1855?—We used to go out for the midsummer herrings about three or four years before then.

14,064. Not longer ago than that?—No, I was in the first vessels that ever did go for the midsummer herrings.

14,065. What kind of takes were they that you had in the midsummer seasons before 1855?—We did not use to take very heavy herrings, but we took at one particular time very heavy young mackerel.

14,066. Have you observed that the midsummer seasons since 1855 have been worse than they were before?—We have not prosecuted the midsummer voyage so much lately as we used to do.

14,067. I understood you to say that you only went out after the midsummer herrings for three years before 1855?—I only went out for them, I think, about three years before 1855.

14,068. And you said the take of herrings was not very considerable then?—No, it was not very considerable.

14,069. And that 1855 was an exceptional year, and that since then the midsummer fishing has fallen off?—Yes.

14,070. I want to know what the years before 1855 were, and what the subsequent years have been; have they been better or worse?—The three years after 1855 were much better than the three years before 1855.

14,071. I think you said the spring herring-fishing began about the year 1855?—I began it then myself.

14,072. Was that the year in which it was generally begun by others in the trade?—There were a few who began it some time before that.

14,073. But was it general before that?—There were not many boats at that time of day. They were only a very small class of boats at that time.

14,074. Do you attribute the falling off that has taken place in the catches of midsummer herrings to the spring fishery?—I could not say that. I should not like to express an opinion about what I do not know.

14,075. Have you observed any very great variations in the takes during the same season?—Yes, wonderful variations sometimes. Some years you may go and catch very little. I remember being out one fishing season when we only got 18 lasts the whole season. We could not catch any good herrings; they were all shotten fish. That was when I was a boy.

14,076. At what time of the year was that?—In the autumn. They did not go spring herring-fishing then, nor yet at midsummer.

14,077. What is the cost of your boats when they are fitted with nets?—About 800*l.*

14,078. And how do you pay your men?—By shares.

14,079. I want to know how you calculate the shares? how much for the boat, how much for the captain, and how much for the men?—Why, if we get about 260*l.* and there are 60*l.* expenses, about 100*l.* will go among the men.

14,080. And the rest goes to the owner of the craft?—Yes.

14,081. Supposing the whole sum made in the year is less than 260*l.*, say 160*l.*?—Do you mean in the whole year?

14,082. No, in the season. You pay the men by the season do you not?—Yes, we pay them by the season.

14,083. Do you then take the sum of 60*l.* off for expenses?—Sometimes they come to as much as 120*l.* It depends upon the losses. Last Monday a smack got into my nets, and my nets were picked up, and they charged so much for picking them up.

14,084. And that has to be deducted from the profits of the season?—Yes.

14,085. From the amount you make in the course of the season you deduct first of all the expenses?—Yes.

14,086. And the remainder, how do you divide it?—The men take half and the owners take half. They generally run nine shares to the owner and eight to the men.

14,087. How many men are there in your boats?—Nine and 10.

14,088. How many of those are boys?—Only one.

14,089. Are the boys apprenticed?—No.

14,090. Then do you make a separate bargain with your men for each of the three seasons?—Yes.

14,091. And do you take a separate crew each season?—Very often the same crew; but sometimes not. The crew I have in my boat now I have had along with me three or four years. In fact one has now been with me five years.

14,092. Which season, on the average, have you found to be most profitable?—According to the outlay of property we have found the spring season most profitable. It costs but very little to send our boats out in the spring season. I have had 200 nets put on board one of my vessels now. They might be seriously damaged by a vessel going through them and tearing them to pieces, because they all float on the top of the water on this part of the coast. In Scotland they send them so many fathoms under water.

14,093. Then would it materially interfere with your profits if the spring season were to be done away with altogether?—Well, everything would find its level.

14,094. Do you think the price of fish at other times would make up for it?—I have no doubt of that. It would do some people good, and others a great deal of ill. A great many get a living by prosecuting the spring fishing at a time of year when they have nothing else to do. There are some 2,000 or 3,000 people about here who get a living by the fishing in the spring season, and if it were not for that they would have to be maintained by the parish.

14,095. Do you use the same nets in the three seasons?—The midsummer nets and the spring nets are about the same class.

14,096. Have you laid up for the autumn season. Have you finished it?—We are only now prosecuting it.

14,097. But you have three separate sets of nets for the three seasons?—We could use them so, but we generally take the midsummer nets for the North Sea, but we have our separate nets for the spring season.

14,098. What is the size of the mesh you use in the spring season?—We get them 36 meshes to the yard when we buy them.

14,099. But they shrink to something less?—Yes; sometimes eight or nine meshes to the yard.

14,100. Have you known cases in which nets have been ordered of a smaller mesh than 36 to the yard?—Some people would order them at anything.

14,101. Do you think there are many nets used in the spring season that are less than the regulation mesh?—I have heard people talk of ordering them at 37.

14,102. Have you seen new nets that are less than the legal mesh?—Yes, I have seen them ordered. I have heard people talk of ordering a certain mesh.

14,103. Do you think that any considerable proportion of the nets used in the spring herring-fishery are of a less mesh than 36 to the yard?—Yes, they are all of a smaller mesh than 36, after they have been used. I do not think it would be practicable to order them less than that, because they are sure to shrink up very small. The more they bark them the more they shrink.

14,104. What is the usual length of the siezings by which the nets are suspended to the warp; does that vary according to the season?—We generally let our warps go right under the nets. We let our warps drop under them on this coast; but in the North Sea it is quite a different thing.

14,105. Are the fish deeper in the water in the spring than they are in the midsummer season?—No; about the same.

14,106. And about the same in the autumn, too?—Yes.

14,107. Do you agree with the previous witness that it is desirable there should be a Government inspection of the nets to see that they are not less than the legal mesh?—I do not see how you could do that.

14,108. Why not?—If I go and buy nets of 36 gang to the yard (and they cost a good deal of money now, something like 2*l.* per net, when they are fitted up), I do not know that the 36 gang will not run up to 38.

14,109. You cannot tell what they may turn out to be after they have been used?—Why, after they are half used they will become good for nothing on an inspection, and then who is to pay me for my nets?

14,110. I suppose we may take it that for the spring season, when the nets are least used, they are of no use unless they are 36?—They are of no use if they are a less number than 36. In that case they would catch but few herrings.

14,111. Then you find it necessary that the nets should be of a rather smaller mesh than that?—Yes.

14,112. And they become smaller by the barking, and by being used?—Yes.

14,113. Then for the midsummer fishing the mesh is rather larger?—We order the midsummer nets about 31 gang to the yard.

14,114. And for the autumn fishing what size do you order them?—About the same size as for the midsummer.

14,115. I think you said just now that you have quite recently lost some nets?—Yes, last Monday there was a smack went into my nets.

14,116. Was that a trawling smack?—Yes.

14,117. Did it get through them?—Yes, if you will just look at that letter (*handing in a letter*) you will see.

14,118. Did you take the number of the smack that cut through your nets?—That is the very thing we should like to do.

14,119. Are not the smacks that are fishing out here numbered?—They are numbered, but sometimes, if it is dark, we cannot see the smack that has done the mischief. Perhaps it happens at 11 or 12 o'clock at night. We hear a cry of "a sail," and we come up and go to work to get our nets in, but before we have got far he is clear, and away he goes. We cannot go after him; we must pick up our nets, and then if we fix it upon any smack the men will say, "It was dark at night; you never saw us cut the nets."

14,120. Then you cannot see the use of the number to enable you to enforce your claims against smacks that cut through your nets?—Well, sir, you see we cannot catch them, that is the point. If anybody cuts my nets, I want to catch him.

14,121. Do you think it would be better if they were numbered in a more conspicuous way?—It is of no use to number them at all. We cannot see them in the dark. They are, perhaps, half a mile or three quarters of a mile off. You can probably just see that it is a fore-and-after, a smack; you can tell by what little light there is whether it is a fore-and-after, or whether it is a ship, but you cannot see the number.

14,122. Have you frequently suffered the loss of nets in that way?—This is the third loss I have had this year. Another loss I have had I daresay was 18*l.* or 20*l.* My nets were cut into, and I was cut adrift, and my partner was in the same mess two or three nights afterwards. They know when they do these things that we cannot hurt their nets.

14,123. Did you take the numbers of the smacks? We cannot get at them. If they would drift alongside of us we could.

14,124. Have you suffered before in previous years?—The year before last I did.

13,125. Are there many cases in Lowestoft of persons who have lost their nets in that way?—It is a common occurrence. It is of no use to say anything about it, because we cannot do anything in it. So far as my vessels are concerned, 20*l.* or 30*l.* damage is done, and I do not get a halfpenny for it in the way of compensation.

14,126. Do you agree with the previous witness that the trawlers are sometimes fitted with an apparatus for the purpose of cutting through the nets?—I have heard talk of such a thing ever since I was a boy, and have heard people say that they have seen them.

14,127. Have you ever seen them yourself?—No, I have not. It is a rare thing for a fisherman to see them, because they generally keep them out of sight.

14,128. I want to know whether you have ever seen such a thing?—I have never seen one, but I know how they are made, according to what I have been told. They do not want a very sharp instrument if there is a great strain on the warp.

14,129. Have you ever seen the instrument?—I have never seen the instrument myself.

14,130. Have you ever seen a net cut with that instrument?—No.

14,131. In any of the cases to which you have referred, do you suppose that your nets have been cut by such an instrument?—I know they have been cut by some instrument.

14,132. Have they never been broken by a boat passing through them?—Yes, several times I have known them to be cut right through by a boat passing through them.

14,133. A boat would pass right through without being stopped, I suppose, if it were going at any speed?—Yes, they do not want much of an instrument at the bows.

14,134. Why is it that the fish when they come to this part of the coast swim near the surface?—The water at this part of the coast is quite a thick muddy water; but on the north coast of England the water is clear. I say the sky has a great effect on it, and that the more moonlight there is the farther we have to go down for the herrings in the north sea; but the moon does not have so great an effect off here because of the water being thicker.

14,135. You say that because the water here is more muddy than in the North Sea you find it necessary to keep the nets nearer the surface?—Yes.

14,136. And does that expose the nets to injury from the vessels?—Yes, our nets; but it does not affect the trawling vessels.

STOFT. Taylor. v. 1863.

14,137. But the trawling vessels would damage your nets?—Yes; the trawl is right down on the bottom, and the warp extends up to the ship. Our warps are only about three inches and are not so strong as theirs are, and they see our nets float on the water and then come clean through.

14,138. The sailing vessels, from the fact that your nets are nearer the surface off here, do more damage to your nets than they do in the North Sea?—Yes, the sailing vessels do.

14,139. So that your nets are exposed to more damage here than in the North Sea?—Yes; three times more damage.

14,140. Is it almost always at night that the vessels pass over your nets and injure them?—Yes; they never trawl over us in the daytime.

14,141. May it not happen that a vessel may cut through your nets at night without being aware of it?—It may happen so.

14,142. Then they do not do it on purpose, but because they do not know that you are there?—I do not know.

14,143. They have the same difficulty in seeing you that you have in seeing them?—They have the same chance of seeing us; we always have a light exhibited at night.

14,144. Where is it that you generally suffer damage from the trawling vessels?—We cannot go 24 miles from our own shore but we find the smacks about.

14,145. Then your herring-fishing is very much on the same fishing ground as the trawling fishermen frequent?—It always is, except in the midsummer season.

14,146. I suppose it would not remedy the evil of which you complain if the trawling fishermen were to be excluded from coming within a mile or two of the coast?—Not a bit; because they never trawl within the Knoll.

14,147. Where is it that you stated those small fish are caught for manure in the month of January?—In the Lincolnshire Main.

14,148. Is that in the Lincolnshire Wash?—Up towards Boston.

14,149. (*Mr. Caird.*) Between there and Lynn?—Yes; right up to the Sound going into the Humber. They fish especially for sprats.

14,150. It is called sprat-fishing?—Yes.

14,151. And you think they are young herrings, do you?—I am sure of it.

14,152. Do you think the sprat and the young herring are the same thing?—No; they are as different as can be.

14,153. Then you think they catch young herrings and not sprats?—Yes, I am quite sure of it. They do not know what is going into their nets until they have got them. Sometimes they will get a boatload of sprats, and at another time they will get a boatload of young herring.

14,154. Is it within certain limits that are well ascertained that that fishing goes on?—It is about a mile and a half from the shore.

14,155. Is the same ground regularly fished with the same object every season?—Yes.

14,156. Ground that can be well defined and ascertained?—Yes; they fish there every season to my certain knowledge.

14,157. And have you any notion as to how many boats are engaged in the fishing there?—There are several from Cleethorpe.

14,158. Are there large quantities caught and sold there?—Yes, I have seen boatloads of them.

14,159. Do you think that the catching of those small herrings injures the herring fishery?—Why, they catch as many in one day as we catch in a whole season.

14,160. Has that been going on for a long time?—Yes, ever since I was a young lad.

14,161. Have you not a larger herring-fishing on the coast than formerly?—Yes; because we have a greater number of boats.

14,162. Then it would appear that that fishing has not done much damage?—I do not know what damage it has done.

14,163. (*Mr. Lefevre.*) How long have you been the owner of a herring boat?—Since 1855.

14,164. Have you kept accounts every year of your expenses?—No; I have kept no accounts.

14,165. I think you stated a little time ago that 1*s.* a hundred during the spring season was the price you had been offered?—Yes.

14,165a. And that that would pay you?—Yes.

14,166. What should you reckon for the midsummer season?—Do you mean what price would pay me?

14,167. Yes?—Why, that would all depend upon the take; because we take a great number of spring herring sometimes. It is quite a speculation.

14,168. Making the same calculations for the midsummer as the spring, what would you say would be the average price per hundred?—I could not say.

14,169. Can you give us any notion as to the autumn fishing?—The fish vary so very much in prices.

14,170. You have given us a kind of average for the spring. You say a fair average is 1*s.* per hundred?—I have been offered that price but I never took it. I would not risk that. I have generally made more than that, taking the round of the season.

14,171. But you cannot give us any calculation for the midsummer or the autumn of the same kind?—I should not like to take 1*s.* a hundred for my catch.

14,172. (*Mr. Caird.*) At the present moment is there much difference in the quality of the herrings brought into the harbour here? Is there at this moment one herring that will bring a higher price than another?—Yes, there is a great difference.

14,172a. What is the cause of the difference?—The different grounds they are taken off.

14,173. Are the shotten herrings caught in here, near shore?—The good quality of herrings are caught further off.

14,174. And the inferior herrings come nearer inshore?—Yes.

14,175. Are they caught by an inferior class of boats and gear?—They are caught with smaller boats, but with the same gear. They do not proceed far out to sea.

14,176. And they are obliged to be content with the inferior quality of fish?—They are forced to be.

14,177. (*Mr. Lefevre.*) I suppose the French boats do not come here in the spring season?—They do not catch here, but they buy a great quantity of herrings of us. They will give us any price for them sometimes. I have known them last year give as much as 9*s.* a hundred.

14,178. Do they salt them?—No, they do not salt them; they use them for bait. I have known them give 9*s.* per hundred

14,179. Was that early in the season?—Yes.

14,180. And were they simply for bait?—Yes.

The witness withdrew.

Kemble.

GEORGE KEEBLE called and examined.

14,181. (*Mr. Caird.*) Have you been a fisherman here long?—No, I have never been a fisherman here.

14,182. Have you not been interested in the fishing at all?—Yes, I am interested in it; looking after the fish and sending them to market.

14,183. Where were you a fisherman?—At Barking, Harwich, and Gravesend.

14,184. A trawl-fisherman?—Yes, a trawl-fisherman and a line-fisherman.

14,185. At the present moment are you interested

in the herring fishery here?—No, not at all. I am solely in the trawl and cod fishery.

14,186. Is the number of boats employed in the trawl and cod fishery on the increase here?—Yes; they come in here when the wind is adverse.

14,187. Do you mean when the wind is adverse for their going into the Thames?—Yes. I have been fishing ever since 1810, and for the first seven years I was in the line fishery. I never saw a trawl when I was first apprenticed.

14,188. Has the increase principally taken place in the trawling vessels?—They have increased in some places and decreased in others.

14,189. Which is the most profitable, the line-fishing or the trawl-fishing?—There are a great many trawl fishermen who go a lining at different parts of the year.

14,190. Are the vessels of the same size, and are they equipped in the same manner?—Yes.

14,191. Have the line-smacks wells?—Yes.

14,192. Do they come in here?—Occasionally they do; when they cannot get to the river they make the first market they can get to. But at this season of the year the principal part of them go to Grimsby, and about Christmas time we shall get a great many of them here.

14,193. Are the numbers that come here increasing?—Yes; they have been on the increase for the last two or three years.

14,194. Do the cod-men complain of the trawl fishermen damaging their fishing?—Not that I have heard.

14,195. Do they both fish on the same grounds?—Yes.

14,196. The line fishermen prefer the rough ground?—Yes; and the trawl fishermen prefer the smooth ground; but they are generally mixed about the one with the other.

14,197. And you say that the line fishermen in the large vessels do not complain of the damage done by the trawling to their trade?—No.

14,198. Have you ever seen any of those knives you have heard referred to for cutting the nets of the fishermen?—Yes; I have used them.

14,199. Was that in order that you might cut quickly through the nets?—Yes.

14,200. Did you find that you did less damage in that way than by running through them in the ordinary manner?—That was the only manner in which we could get clear of them. But that has been done away with now for some years. It was not practiced above one or two seasons.

14,201-2. Why was it discontinued?—Because it was so much complained of by the drift fishermen.

14,203. Is there much damage done to them?—Yes.

14,204. And is there no remedy?—No, I cannot see how there can be. They cannot catch the smacks. The drift fisherman has as much chance to get rid of the trawlman as the trawlman has to get clear of him.

14,205. But the drift fisherman cannot get rid of the trawlman. It is you who do the mischief and not they?—That is clear.

14,206. They do not hurt you, but you do hurt them?—There are certain times when they catch us, but at certain times we catch them. I have seen them frequently have to be cut, and we have sometimes cut our ropes and let theirs be fast, but it is only in fine weather that we can do that.

14,207. Have you in your experience as a trawl fisherman found any of the fishing grounds you frequent ceasing to yield plenty of fish?—No; I believe there are more trawl-fish than ever on the same grounds.

14,208. Are there no grounds that you used to frequent which have been fished out?—No.

14,209. There are no grounds which you as a trawl fisherman would avoid because they have been fished out?—No.

14,210. How far does your fishery extend?—I have been all round England, Ireland, and Scotland trawl-fishing and line-fishing.

14,211. And on the Dutch coast also?—Yes; in my belief there are as many fish caught now as there ever were.

14,212. Don't you think there are more?—In certain times of the year if you go and trawl about one piece of ground of about 20 or 30 miles in extent for a month you will clear that piece, but if you go 20 or 30 miles further you will find the same quantity of fish, and then if you leave that ground and go back to the other you will find the same quantity of fish again.

14,213. Has there been any increase in the line-fishing?—There has been a great increase in the line-fishing, but a decrease in the quality of the fish caught.

14,214. What kind of fish has decreased in quality?—The cod.

14,215. Are the cod not so fine now as they used to be?—No.

14,216. Not on any part of the coast?—No.

14,217. Do they not catch as fine codfish on the Dogger Bank as they used to do?—No. I had seven years fishing on the Dogger Bank, and at that time we seldom used to see any small cod, and if we got a small one and he was alive we used to chuck him overboard. But at that time they did not work long-lines along the shores. We did not know how to work long-lines then where the tide runs; but now they work long-lines all along the shores, and if they get 50 score of cod, as they call them, they will not have five score of good-sized fish. They are mostly small fish.

14,218. Do you think it is the line-fishing along the coast which damages the fishing at sea?—Yes, I do.

14,219. And not the trawl-fishing?—No.

14,220. Are there many cod caught with the trawl?—No, very few.

14,221. Are there any other fish that are decreasing in quality?—I do not believe the soles at certain seasons of the year are so good as they used to be. Before the railroads came here there were very fine soles, and a very large quantity caught at certain seasons of the year at Smith's Knoll. There was a great abundance of very fine soles; but the fishing was then only two or three months in the year, and Smith's Knoll remained after that undisturbed for seven or eight months. Now, however, it is raked about all the year round, and the soles are not so fine as they used to be.

14,222. Not so fine in that particular place?—Yes, that is so.

14,223. But they are caught on other grounds?—Yes; but not in so large a quantity as they used to be.

14,224. Then that is an instance in which the trawling has diminished the quality?—Yes, but I believe there is a greater bulk of fish caught on that particular ground.

14,225. (*Mr. Lefevre.*) Are you yourself now engaged in trawling?—No, I have not been out for the last 13 or 14 years.

14,226. Then your experience extends beyond that period? Since then you only tell us what you hear, and not what is in your own knowledge?—I see the fish; they come under my notice every day.

14,227. Are you a salesman now?—No; what is called a fish agent.

14,228. Do you attend to the smacks?—Yes, and the liners.

14,229. Do many trawlers come in here to send their fish off to market?—We sometimes have a few; but we never have a great number coming in here.

14,230. But a great many more than formerly come to this port?—Yes; a great many come from Ramsgate. They generally fish off the town or about this coast.

14,231. Do they take in ice here in the summer time when there is ice for them?—They ice the fish when they catch them, and when they take ice from here they bring the fish here.

14,232. How long have you been at Lowestoft engaged in this way?—Five years.

LOWESTOFT.

G. Keeble.

21 Nov. 1863.

14,233. Have you observed any increase in the number of trawlers in that time?—Yes, I believe there are more come here than used to do, but there is no certainty about them now. If they can get here sooner than to another port they come here, with the exception of Mr. Morgan's vessels, which come in the summer months.

14,233*a*. Who is Mr. Morgan?—A salesman at Billingsgate. When his boats are fishing here they come in here. They generally come about the latter part of July, and they stay until the beginning of October.

14,234. Are they trawlers?—Most of them are trawlers.

14,234*a*. What part of the coast do you refer to when you speak of the long-line fishing?—From Flamborough Head up to Orford Ness, and from Flamborough Head down to the Fern Islands.

14,235. Is there much long-line fishing along the Norfolk coast?—There is a good deal along the Lincolnshire coast at this season.

14,236. And along the Norfolk coast?—I do not think there are many smacks fishing along the Norfolk coast now.

14,237. At what places along the Lincolnshire coast? coast?—Grimsby is the principal place; they go out from there and from Flamborough Head right along the shore up to the Dudgeon, and up to Cromer and back.

14,238. At what distance from the shore do they fish in that way?—Sometimes as close as they can get; from 10 or 20 fathoms to 20 miles off.

14,239. You say that it is in quite recent years that they have discovered how to fish along shore with long lines?—Yes.

14,240. How long ago is that?—I should say within the last 30 years.

14,241. Do they fish from smacks or do they come in open boats?—From smacks.

14,242. They do not come in open boats from the villages?—No; I do not think there are any open boats fishing on this side of Flamborough Head.

14,243. They fish in smacks which come from Hull and Grimsby?—Yes, and in Barking and London smacks.

The witness withdrew.

W. Catchpole.

WILLIAM CATCHPOLE called and examined.

14,244. (*Mr. Caird.*) You are a fisherman?—Yes, but I know nothing of trawling.

14,245. You fish for herrings chiefly?—Entirely for herrings. I never had anything to do with trawl-fishing.

14,246. Do you find the spring fishing a beneficial and profitable fishing?—Yes, quite so.

14,247. You would not like to be deprived of the spring fishing by any regulations established by law?—Not by any means.

14,248. Are not the spring herrings of inferior quality?—Not in the latter part of the season. At first they are rather dry, but they are eatable.

14,249. Are a larger quantity of those fish caught because the spring fishing can be followed at a moderate outlay of capital and gear?—They realized large prices last year in consequence of supplying the Frenchmen with bait. They come in here entirely dependent upon us for bait. I don't think they could go on without our spring catch.

14,250. And is a large quantity sold to the Frenchmen?—Pretty well all. They entirely depend on our spring fishing for their bait. They come here a score or 30 of them at a time.

14,251. Where do they fish?—On their own coast.

14,252. And they come across for bait?—Yes.

14,253. Do they want the bait for line-fishing?—Yes, for various sorts, I believe—cod, and skate, and ray.

14,254. Do you sell the bait over the boats' side to the French boats out at sea?—We sell it to the French boats in the harbour.

14,255. Is any large portion of the spring herrings sold in that manner?—Yes, the greater part of it.

14,256. Hundreds of barrels?—Yes, I may say hundreds of lasts.

14,257. How much have you yourself got for bait sold to the French fishermen?—We realized 230*l*. last year.

14,258. For bait?—Yes, and for other purposes.

14,259. Sold to the French fishermen?—Yes.

14,260. Independent of what you sold on shore?—Yes. During the time of Lent there was scarcely any fish went into the country; after Lent was over the fish was sent into the country markets.

14,261. The French bought the fish during Lent?—Yes.

14,262. Don't you think the fish went to be eaten in France during Lent?—No.

14,263. Did they tell you the fish were all used for bait?—Yes.

14,264. How much would you sell at a time to a French fisherman?—Not more than 2,000 or 3,000. Those French fishermen fish off Dover and in the channel principally. They will not go away without the bait, and they carry a good stock of it with them.

14,265. You say that that was the case last year?—Yes.

14,266. Have you such a demand as that for bait every year?—Not so much as we had last year. I have not heard of such a demand for bait as there was last year.

14,267. And after Lent that demand ceases?—Yes, the price goes down. They did take them afterwards, but not to that extent.

14,268. They did not require so much bait after Lent?—No.

14,269. Would you think it very prejudicial to your interests as a fisherman if any regulation were to be adopted shortening the spring season?—I should not, for my part, like to have it entirely abolished.

14,270. Would you like to have any regulation established as to when it should begin?—I should not.

14,271. Would you like to have a close time when it should begin?—Not for my part.

14,272. Whether the fish are in good condition or not?—Well, sir, it is our livelihood. We never mind the quality if we can sell them.

14,273. Do you think that in saying that you are stating the general feeling of the fishermen here?—Yes, I should say so. They are not all here to speak. I expected to see more of them here, or I should not have come up myself.

14,274. Has the summer fishing in your experience decreased in recent years?—I do not know that it has. We generally look upon it as of less consequence than the spring fishing. I have never made a very large catch during the midsummer.

14,275. Was it never of much importance to you?—Not so much as the spring. I would sooner chance the next spring than I would the midsummer.

14,276. You would sooner lose the midsummer fishing than the spring fishing?—I would for my own part.

14,277. Do you think for the supply of the markets the spring fishing would be a greater loss than the summer fishing?—I was speaking of the Frenchmen, who depend entirely on our spring fishing for their bait.

14,278. With regard to the autumn fishing, do you agree with the previous witnesses that that continues to be a very profitable fishery?—Yes.

14,279. Are you much interfered with by the French fishermen during your autumn fishing?—Not to any particular extent. We do not come into contact with each other much.

14,280. Have you ever prosecuted the mackerel fishery?—Not for the last 20 years.

14,281. Has it been falling off?—Yes, it has.

14,282. What has been the cause of that?—I cannot say.

14,283. Has it anything to do with the spring herring fishery?—I should think not.

14,284. Do you ever see many mackerel at that time?—Not more than two or three in the whole season. It is quite out of the mackerel season.

14,285. Do you use a separate net in the spring season?—The fishing net generally works smaller.

14,286. And as the meshes get smaller you use the nets in the spring?—Yes, the same nets that we used in the autumn we get to use in the spring. I had a great number and worked them up in that way. We get them 32 meshes to the yard, and they afterwards go up to 37 or 38, and that sized mesh will catch any herrings.

14,287. Do they not get smaller than that?—I have none smaller; that is quite small enough.

14,288. They are never made as small as that?—No.

14,289. Are no nets made as small as that?—I have none made so small.

14,290. Are there no nets made so small as that, used in the spring fishing?—No, none made so small as that.

14,291. We hear that they sometimes go up to 40?—They generally work up to 37, 38 or 40, from 32 and 33.

14,292. Is there any difference of opinion among the salesmen as to the advantage of fixing a time for the spring fishing to commence?—I do not know that there is.

14,293. Is it any interest to the fishermen to have a good summer season rather than a good spring season?—We want to catch as many as we can.

14,294. But some fishermen think it advantageous to have the spring fishing and some do not. How arises this difference of opinion?—I cannot say what is the reason for the difference of opinion. I have been 35 years at it and have never missed, and in the spring I have done nothing else for a livelihood. I do not see any reason why the spring fishing should be put entirely on one side.

14,295. Have you prosecuted the spring fishing all that time?—Yes. I have never missed a season and I don't suppose I shall as long as I am able to go the voyage. We have a regular time.

14,296. Do the fish come regularly at that time?—Yes. We generally get plenty when we first go out, and I dare say we should get them before then if we were to go out before.

14,297. You never began the spring fishing in February?—No, I never did.

14,298. Did you never fish in January?—I never heard of its being done.

14,299. Are there no fish to be seen at that time?—I never tried.

14,300. It would be considered rather a dangerous season to prosecute the fishing in the depth of winter?—We never prosecute it till the spring.

14,301. Do you consider the quality improves as the season goes on?—Yes.

14,302. Is there much fish brought here that is used for manure?—Some that gets in three or four days after being caught, and that would not pass at all.

14,303. Are they never used for manure except when they have been caught too long?—I do not know of a case last year. Last year was a very favourable one; we got long prices last year.

14,304. There were none sold for manure then?—Not that I remember.

14,305. Generally speaking, when the fish have been sold for manure has it been on occasions when the boats have been detained for some time at sea and the fish cannot be brought fresh into market?—Exactly so. Contrary winds will cause it. We fish generally a long distance off, quite in the deep water, 40 or 50 miles from the land.

14,306. For the spring herring?—Always as far as that. We have to go a long distance.

14,307. Do you get large catches in the spring?—No, sir; not so large as now. Last year the spring herring season was a very scarce one.

13,308. Are you fishing just now, at this time?—Yes, sir; I was out last night.

14,309. What sort of catches are you getting just now?—We got 11,000 last night, one last and 1,000.

14,310. You got 11,000 herrings?—Yes.

14,311. And their price?—7*d.* a hundred. Some have been sold for less.

14,312. Is that an unusually low price?—Yes, it is at this season.

14,313. Were those inferior herrings?—Yes, what we call shotten herrings.

14,314. Were they caught pretty nearly in-shore?—Yes, quite close; we could see the land.

14,315. And are there more coming into the market that are selling at a higher price?—Yes, fish that have been caught further off the shore. If a man is fishing in a small boat he does not think it safe to go far from land.

14,316. What is the better quality selling for at this moment?—Something like 1*s.* a hundred, and 1*s.* 1*d.*

14,317. Do you find yourself paid by the price you have got?—No, but we had better do that than do nothing.

14,318. Is 11,000 a large catch?—No.

14,319. What would you consider a large catch?—From three to four lasts.

14,320. That is between 30,000 and 40,000 fish?—Yes.

14,321. Have you caught that quantity often this season?—I have never done that. My boat will not carry 10 lasts, but some of the large boats will do so. I saw some last week with 10 lasts.

14,322. Have you any idea of the quantity of fish that may be brought in here during the season?—I cannot give you any idea. Some people can.

14,323. Have you ever brought any small mackerel into market here in the spring season?—Never but one in my life, and then I gave it away. It is a miracle to see them in the spring season.

14,324. (*Mr. Lefevre.*) Are you the owner of a small boat?—Yes.

14,325. What is the size of your boat?—About 20 tons.

14,326. Is it a decked boat?—Yes.

14,327. Did you go out in it in the spring for the spring season?—Yes.

14,328. What did you realise then?—Something over 200*l.* for the spring season.

14,329. What did your share come to?—My share came to 9*l.* 8*s.*

14,330. What, as owner of the boat?—Yes, other people got equal to me. 9*l.* 8*s.* was the share.

14,331. And for the spring season you realised something over 200*l.*?—Yes.

14,332. What part of that did you set aside for expenses?—The expenses vary. Something like 30*l.*

14,333. This last season about 30*l.*?—I cannot say exactly. We were about seven weeks out.

14,334. How many men had you?—Five men and a boy.

14,335. And the remaining 170*l.*, how did you divide that?—The boat and nets take half.

14,336. They belong to you I think you said?—Yes, and the boat and nets take half first, after all the expenses have been paid.

14,337. And the remainder was divided among you?—No, sir; my boat takes a share out of the other. First the boat and nets take half, and then out of the remainder the boat takes a share.

14,338. Then you take half as owner, and some 8*l.* or 9*l.* as master?—Yes, exactly. We shared 9*l.* 8*s.* each.

14,339. Now, of the 200*l.* you realised, how much did you get from the French?—I am unable to say. The greater part of it. We sold a good many herrings

LOWESTOFT.

W. Catchpole.

21 Nov. 1863.

at 6*s.* and 7*s.* a hundred. All the herrings we sold to the Frenchmen were sold at that rate. We could only get 2*s.* 9*d.* in our own market. All the high prices were from the French.

14,340. How long did the French come here?—Till Lent—Good Friday.

14,341. When did they begin to come?—When we first commenced.

14,342. What were the French boats; smacks?—No; luggers, the same as our own.

14,343. The same boats that are used in the herring-fishery?—Yes, the same boats; they put them into trawling and long-lining, and all that sort of thing.

14,344. Did you see them long-line fishing off this coast?—No; but I have seen the long-lines on board their boats. They chiefly fished in the Channel this year, betwixt Dover and Calais.

14,345. What number came in here?—Sometimes I have seen 20, that is about the most I have seen.

14,346. Do you realise from them higher prices than you can get from the salesmen on shore?—Yes, decidedly.

14,347. What number of herrings would one boat buy at a time?—Never more than 3,000 or 4,000; that is as many as they can keep good during the time they use them.

14,348. And of the 200*l.* the best portion was realised from the French?—Yes, that it was, I am quite certain of that.

14,349. Did you go out in your boat for the summer season this year?—Yes.

14,350. What did you realise this midsummer season?—I made up in debt.

14,351. You made no profit?—No.

14,352. You did not divide anything among the crew?—Not a farthing.

14,353. How long have you owned that boat?—Something like six or seven years.

14,354. Has it been a profitable concern to you?—I have just got a living out of it, we call it bread and cheese; I do not think of earning anything else.

14,355. Should you have any objection to any limit being put upon the time when you should go out in the spring?—Well, I don't know; I don't suppose anything I could say would alter it, but the time we usually begin is about the middle of March.

14,356. Do you think it would be advantageous to you to have a limit put to the time?—If we were allowed to begin before the fish would not be fit.

14,357. But suppose you were not allowed to go out on the spring voyage until the middle of April?—Our spring season would then be nearly over.

14,358. And you would lose all those good prices you get from the French?—Yes.

14,359. (*Mr. Caird.*) That may be called a Lent fishing?—Yes.

14,360. How many French fishing boats come into harbour to buy bait?—They come in in various numbers; I have seen as many as 20.

14,361. How many boats come in altogether, as many as 120?—Not so many as that. I think the season in course of time will wear itself right out; there is not half the quantity of spring fish as there was before; at one time it would hardly answer the purpose to buy the nets, but last spring was better; it was thought as the nets worked out it would not be worth while to buy more for that purpose.

14,362. How many fish would a French boat buy at a time?—Something like 3,000 or 4,000.

14,363. And how many fish may you bring in your own boat at a time?—Something like three or four lasts.

14,364. 4,000 or 5,000 are half a last?—5,000 are half a last.

14,365. How could it be possible that 20 boats, each buying half a last, would take the quantity that the herring boats bring in?—Why half of them do not get enough.

14,366. You mean that the herring boats themselves have very few in them?—The catch is anything but regular; at this time of the year the fish are very regular, and all get them, but in the spring it is not so.

14,367. Then the spring fishing cannot be very profitable on that account?—Why, the one who does not get them this time will get them next time; if I missed to-night I should get them to-morrow night.

14,368. How long have the French been off this coast?—Ever since I can remember; ever since the spring fishing was first carried on, and it is my opinion that we shall have more another season, because the French have done well with what they caught.

14,369. Have you ever sold any fish for manure?—I have at chance times, when they have not been fit to eat.

14,370. When you have come in with the fish still fresh, have you ever sold them for manure?—Years back I have; three or four, or five or six years back, in consequence of the Frenchmen a great many have been sold.

The witness withdrew.

W. R. Archer.

WILLIAM ROBSON ARCHER called and examined.

14,371. (*Mr. Caird.*) We shall be happy to hear what you may have to say?—I will give you some facts. In the year 1855 a great number of the herrings caught during the Midsummer voyage were sold at a less price than those which were caught during the spring season. During this year we have had no herrings reach the price that the spring herrings were sold for—neither the autumn herrings nor the midsummer herrings—because during the spring fishery the herrings once touched 11*s.* a hundred, whereas during the present voyage they have scarcely exceeded 3*s.*, and many of them have been sold for 6*d.*, while a great many have been sold for manure.

14,372. (*Mr. Lefevre.*) Have you been long at Lowestoft employed as a solicitor?—Yes.

14,373. Are you at all connected with the trade?—No, I am not at Lowestoft; at Yarmouth I am.

14,374. Have you any clients among the owners?—Yes, I have both smack owners and herring-boat owners.

14,375. Can you say from your experience that the trade has been a profitable one of late years?—Well, I cannot say it has been profitable to all; it has been so to a great many. But the herring fishery is like everything else, it ebbs and flows the same as a town. You find that a town is rising at one time and ebbing at another. When I knew Lowestoft 15 years ago the herring fishery was in a wretched state. At that time they were all large boats, and then small boats were introduced and they commenced the spring-fishing, and have continued it up to the present time. The fishery of Lowestoft has gradually increased and improved. At the time I speak of there were not more than 15 or 20 boats employed in the mackerel and herring voyages—if I am speaking correctly, and I should like to be correct. About 24 years ago, a great many of the fish merchants were in a state of bankruptcy. That I know from my own personal knowledge. The herring fishery has gone on increasing from that time until it has reached the number of boats of which you have had evidence before you this morning.

14,376. Do you agree with the last witness as to the trade that has grown up in selling fish to the French for bai?—Yes, most decidedly.

14,377. Are there a large number of boats here?—Yes, and it is quite amusing to stand on the pier of a morning and to see the competition among the French to get the herrings before the fishing boats get into the harbour. You may see three or four Frenchmen rowing their boats alongside of the herring boats to ask the prices.

14,378. Have you any knowledge of the prices that are given by the Frenchmen for the fish?—By common report it has been as high as 11*s.* per hundred.

LOWESTOFT.

W. R. Archer.

21 Nov. 1863.

14,380. That is the best price that has been got for the herrings this year?—That is the best price that has been obtained, I believe, this year. I should state that the observation I made just now in regard to the year when the spring fishing was introduced was applicable to the year 1844 or 1845, before Mr. Bradbeer came to Lowestoft, and when the fish trade was in a very depressed state generally. It has since gone on improving from the establishment of the second-class luggers, and those second-class luggers have increased to the size of the first-class now. In regard to the keeping of the midsummer herring, it has not been brought prominently before you that the midsummer herring are not herring that you can preserve. Fish curers would tell you that you cannot keep the midsummer herring longer than a week, whereas you may the autumn herring almost any length of time.

14,381. The great trade of Lowestoft in curing herring is in the autumn herring?—Yes. The spring and the summer herring must be sold almost immediately and eaten.

14,382. With the exception of the French trade for bait?—Quite so.

14,383. Is it in your knowledge that the French use those herrings for bait?—Yes; at least I have not seen them right through Lent; but I have seen the lines, and I have seen a request from a friend of mine at Dover, asking to have 3,000 herrings sent for bait.

14,384. (*Mr. Caird.*) Do you suppose that any of those herrings sold for bait are for consumption during Lent in France?—No; I think the rules prevent that. There is a steamer about here occasionally to prevent the sale of fish to Frenchmen. That was a most lucrative trade at one time, on account of the bounty in France.

14,385. (*Mr Lefevre.*) Are the midsummer herring sold as bloaters?—Yes, as bloaters sometimes; they are sold fresh.

14,386. They are also sold as bloaters?—They just hang them up and give them a colour and send them to market, otherwise they would all turn to oil. After they have been hung up a week or 10 days, I have seen fish merchants hold them up and the oil has run out of them. I have seen maggots come from them in two days. You cannot keep them. And again, in regard to the spring herring turning to the midsummer herring, I think there is no doubt about that; but in regard to the midsummer herring becoming the autumn herring I think there is a doubt about that, because they are a different species. You see what we call the little Brown Bank herring caught at this season of the year, and they appear to be quite a different species to those that are caught in the earlier part of the year. You find the herring caught now have ribs as it were, which come up here (describing it), and the earlier herring you find to be a fine boned herring, as different as possible from the North Sea herring.

14,386*a*. What effect do you think any restriction on the spring herring season would have on the trade?—I should say it would be highly injudicious to impose one, or to interfere with the trade at all. There is never any good arising from it, because if you were to stop the trade here, there is nothing to prevent the foreigner from catching the fish on this coast and bringing them in. We cannot restrain other nations if our own people are restrained; if we could it would be a different thing. But even then I should contend that any Government interference either with the size of the mesh or the catching of fish would be highly improper. That is my feeling.

The witness withdrew.

P. Kendall.

Philip Kendall called and examined.

14,387. (*Mr. Caird.*) You are the station master here?—Yes.

14,388. Have you been here some years?—I have been here more than two years.

14,389. During that time has the quantity of fish sent over the different lines of rail under your management increased or diminished?—During the time I have been here the two seasons have been about the same.

14,390. Can you from the books in your possession compare them with previous years?—I believe we have had a better tonnage this season than we have had for several seasons.

14,391. A larger quantity?—Yes; and the spring voyage last spring was heavier than it has been for two or three seasons.

14,392. The total quantity of fish sent over the railway last spring was heavier than before?—Yes; and the quantity last autumn was heavier than in the previous autumn.

14,393. And this autumn?—It is about the same as last year.

14,394. Is it by the ton that you keep the account?—Yes.

14,395. What number of tons of fish were delivered at your station last spring?—I could not tell you from memory. I could only tell you by going into the matter.

14,396. (*Mr. Lefevre.*) Can you give us an epitome of the quantity sent for the last 10 years?—It might be arrived at, but you would have to obtain the information from the secretary.

14,397. (*Mr. Caird.*) Can you tell us, if not exactly, at least about the quantity that was transmitted over the line during the spring voyage?—I could not tell.

14,398. Or during the whole season?—We have sometimes 100 trucks, containing about 300 tons of fish.

14,399. Does that continue for days following each other?—Yes, during the present week we have averaged from 80 to 90 trucks a day, and each truck contains about three or four tons.

14,400. To what destination have they chiefly been sent?—They go to various parts. About one-fourth go to London, and the other three-fourths to stations in the midland districts and in the north.

14,401. Including Manchester?—Including Manchester, Liverpool, Birmingham, and other large places.

The witness withdrew.

The inquiry was then adjourned until Friday, November 27th, at King's Lynn.

King's Lynn, Norfolk, Friday, 27th November 1863.

Present:

James Caird, Esq., M.P. (Chairman.) | George Shaw Lefevre, Esq., M.P.

KING'S LYNN.

E. L. Swatman.

27 Nov. 1863.

Edward Lane Swatman called and examined.

14,402. (*Mr. Caird.*) You are the town clerk here, I believe?—Yes.

14,403. Are you prepared to offer us any evidence with regard to the supply of fish here?—I am quite prepared to tell you what the town council have done in reference to this matter. The town council had been informed that the fisheries had been very much infringed upon, and numerous meetings have been held upon the subject. I think I had better state in the first instance that the corporation of this borough divide the Deeps with the corporation of the borough of Boston. The borough of Boston found the same

KING'S LYNN.

E. L. Swatman.

27 Nov. 1863.

difficulty in the matter that we did. The fisheries on both sides of the Deeps have been terribly infringed upon.

14,404. When you talk of dividing the Deeps, do you mean that this borough has a special interest in them, or that it possesses special rights?—It possesses special rights.

14,405. (*Mr. Lefevre.*) Have those rights been granted to the borough by charter?—They have been granted by charter.

14,406. (*Mr. Caird.*) Are the corporation entitled to fish within certain limits?—Their rights are not exactly rights to fish, but Boston Deeps commence where the Deeps belonging to this corporation end, and the two corporations about divide certain rights over those Deeps between them.

14,407. Will you be good enough to state the nature of the jurisdiction of the corporation of Lynn?—Our jurisdiction extends from Edmundsness to Hunstanton Point across eastward, tending towards the southward as far as the Lynn Well floating light, and from thence straight to Lynn.

14,408. (*Mr. Lefevre.*) Does all the rest of the Wash come within the jurisdiction of the corporation of Boston?—The remainder belongs to the corporation of Boston, and some part of it to the corporation of Wisbech. The Nene enters the estuary.

14,409. (*Mr. Caird.*) What is the nature of your jurisdiction?—The nature of our jurisdiction is that it gives us a right to all the fish and everything found within it.

14,410. Within the limits?—Yes.

14,411. Do you derive any revenue from that property?—None whatever.

14,412. Have your fishermen the privilege of fishing exclusively?—No, none whatever. I believe I am correct in stating that many years ago, perhaps 30 or 40 years, the corporation used to license fishermen to fish in Lynn Deeps; but the right has been abolished and has not been exercised for many years.

14,413. Then is your jurisdiction confined to making regulations as regards the fishermen who exercise their calling upon these Deeps?—Yes, we still possess the right, but the fishermen who used to be licensed are not so now, yet the corporation still claim the right of establishing rules and regulations for the good management of the fishery.

14,414. Do the fishermen observe such rules?—No, and unfortunately we cannot make them.

14,415. Have you any right to impose a penalty if they are not observed?—We impose a penalty, but the nuisance of which we complain is this, that they will take a lot of unsizeable fish and land them at places 20 miles from Lynn where we cannot get hold of them. The farmers take the fish and use them for manure.

14,416. Are those fish caught within your jurisdiction?—Yes.

14,417. Can you give us any more complete statement of that?—No, I do not know that I can; it is a thing, however, that is very well known.

14,418. That has gone on for some years?—Yes, it is conceived to be a great nuisance. For instance the fishermen take the herrings when they are what we call unsizeable. They take them in very large quantities, and the farmers buy them of the fishermen secretly and use them upon the land for manure.

14,419. Can such a business as that, where the article is of a bulky character, be carried on much in secret?—Yes, they do it at Lynn. Then, again, mussels are taken by the fishermen which are unsizeable. They are brought into Lynn, and taken out early in the morning, or early in the day, by farmers in carts. These mussels are taken by the fishermen before they get half the size they ought to be.

14,420. Are they taken off grounds that have long been used for the breeding of bait?—They are taken from grounds over which the corporation of the borough ought to exercise a jurisdiction.

14,421. Does not the corporation exercise a jurisdiction?—Unfortunately we cannot enforce the penalty.

14,422. Is that from want of a legal right?—Yes, quite so.

14,423. Have you no legal right to enforce a penalty?—No, not under the Act.

14,424. Then what is the value of your jurisdiction?—The difficulty we experience is this—the remedy would be worse than the disease. Under an old Act of Parliament there is a clause that the fishermen shall not take unsizeable fish, that the mussels shall be of a certain size, and that the corporation shall regulate that size, but if they do not obey those regulations then the corporation have no remedy at all.

14,425. How long is it since your attention was called to the evils of which you complain?—About four or five years ago.

14,426. Have complaints of this kind only arisen within the last four or five years?—I think not.

14,427. Was there no similar cause of complaint before that time?—The only complaint we had was with regard to the smelts, namely, that the fisherman were in the habit of taking them much smaller than they ought to be taken. Some people, however, did not find fault with it. The same thing also occurs with regard to soles; they are taken much smaller than they ought to be.

14,428. Confining yourself to smelts, when did the complaints with regard to smelts arise?—There have been certain complaints for many years. The fishermen bring up little things not bigger than your little finger.

14,429. Is this place remarkable for the catch of smelts?—There have been immense catches here.

14,430. Have the catches increased or diminished?—I think not, but Mr. Cresswell will be able to give you better information upon that point than I can.

14,431. Have you any idea of what the value of that smelt fishery is to the fishermen?—I have no means of forming an estimate, but it must be of considerable value to them.

14,432. Does it continue throughout certain seasons of the year?—I think the principal catch of smelts is somewhere about this time, in the cool months. I should say from September to Christmas.

14,433. From your own observation are you able to say whether the take of smelts has been increased or diminished within recent years?—I should say that it has not diminished.

14,434. It has not diminished?—I should say not; they are very cheap.

14,435. Why do you complain that the fish are taken when they are what you call immature, as the effect of taking them does not seem to diminish the supply?—We do not complain so much with regard to smelts, the principal complaint is with regard to herrings.

14,436. Is there no complaint with regard to smelts?—I do not exactly say that there is, because many people like small smelts. I do so myself. There is a great preference on the part of many persons for very small smelts over the large ones.

14,437. I think you gave us smelts as one of the fish the destruction of which in an immature state was complained of?—They certainly are destroyed very small. I saw a lot this morning that I should call unsizeable fish.

14,438. Were they so small that you thought them unsuitable for food?—No, I do not say that.

14,439. Were they in a state that rendered them fit for food?—Yes. I happen to know many gentlemen in the country who prefer them small.

14,440. Certain persons prefer small smelts to large ones?—Yes.

14,441. Were the smelts you saw this morning of the size that is preferred?—I call them unsizeable.

14,442. How can they be unsizeable if the people prefer them in that state for food?—They were not larger than your finger. It depends entirely on the cook whether they are rendered eatable. If you have

a good cook there is no doubt that they make very good food.

14,443. I understand you to say that you like them best small?—Yes, I do.

14,444. Do people generally like them of that size?—I do not say that; it depends in a great measure upon the cook.

14,445. If there have been complaints made with regard to the falling off of smelts they have not been well founded so far as this district is concerned?—No, certainly not as regards the supply.

14,446. How is it with regard to herrings?—In my opinion there have been great abuses with regard to herrings.

14,447. Will you be good enough to give us some information upon that subject; is this a place where there have been large takes of herring at any time?—At certain times there have been very large takes, but the herrings migrate very much. We catch them in these Deeps at a certain time of the year, and in August you will find them migrating to Scarborough. Immense quantities are brought from Scarborough and cured here. In the winter time we find them here.

14,448. In what months are they caught here?—In the winter months; in December, for instance.

14,449. Do you catch herring here in December?—Yes. I merely give it as my opinion from what I see cried and bawled through the streets.

14,450. Is there any large fishing of herring here in the month of December?—There is a large quantity cried about the town during that month.

14,451. Are they herring that have been caught in the Deeps and brought in here?—Yes.

14,452. Has the herring fishery increased or diminished of late years?—I do not know.

14,453. You cannot speak on that point?—No, I should say it is pretty much about the same. I do not think it has diminished.

14,454. Of what size are the herring compared with the Yarmouth and Lowestoft fish?—I think they are hardly as big.

14,455. If the catch has not diminished what complaint have you to make?—We think the fishery might be rendered more profitable than it is.

14,456. Do you think that the fish might be much increased in quantity?—Yes, there is a very large fishery here, and the consumption of fish is very great.

14,457. Do you think, if some other regulation were adopted with regard to the taking of immature fish, there would be a larger supply of mature fish?—Yes, immense.

14,458. Do you found that on conjecture?—Not exactly on conjecture, because the question is one that has been well sifted by a committee appointed by the corporation. I believe I could tell you exactly what the increase would be if the fish was more protected.

14,459. Let us hear it?—I think the increase would be immense. This is the report that was prepared by the committee appointed by the corporation some three or four years ago:—

"The committee appointed by the corporation to inquire into the condition of the fishery beg to report—

"That they have held several meetings upon the subject, at which some of the most experienced fishermen have attended and given willing evidence as to the actual position of the fishery, the evils which exist, and the probable best remedies to be applied.

"The committee have also, with the aid of the town clerk, considered the several Acts of Parliament relating to fisheries, and also the Charters of Henry 8 and James 1, which constitute the corporation the special conservators of the Lynn fisheries. An analysis of those Acts, and also extracts from the Charters, accompany this report.

"The committee, feeling that the fisheries in the Deeps are alike interesting to all the ports upon the estuary, have corresponded with the corporation of Boston, whose jurisdiction immediately adjoins that of this corporation. The former body have expressed their willingness to co-operate with this corporation in any measures which may appear to be desirable for the due protection of both fisheries.

"The committee find that the fishery in the Ouse and in the Deeps has ever been considered of importance to the port of Lynn, and was so in the reign of King James, who granted a charter to this corporation by which (although they can claim no exclusive right of fishing) they have the undoubted right to claim the regulation of the fishery within the jurisdiction of the port and harbour, which commences in the river Ouse at a place called Staple Wear, between Magdalen and Stow Bridge, thence through the harbour and channel over a very considerable portion of the Deeps to a point called Gore End, a short distance beyond Hunstanton. This power of regulation has been from time to time exercised by the corporation.

"Upon the present condition of the fishery the committee have to report—

"That there are now (including all classes) about 70 Lynn boats employed, and that they are worked by about 150 men and boys. That these boats are maintained in gear and nets at an average cost of about 30*l.* per annum. That a considerable sum is expended annually in building and in repairs. That the many families pertaining to the men employed are sustained by the fishery.

"The committee submit that the above aggregate sum expended in the town for the above purposes fully justifies the vigilant oversight of the corporation, alike in the interest of the town generally as in that of the fishermen themselves.

"From time to time the corporation has, as authorized by charter, published circular notices to the effect that all illegal nets and 'unsizeable' fish would be seized, and in some cases the penalty has been enforced; still, it appears the law has been constantly evaded, and at the present time the committee find:—That in the river large quantities of spawn fish are taken for the purposes of bait for eels by boats from the upper country" [that is, the district beyond the town] "while the Deeps are being swept by larger vessels from Lynn and Boston, fishing with illegal nets, and taking young herring in large quantities for mere manure, which, if left some little time longer in the water, would be had as valuable herring, for which there is now an unlimited demand at good prices. These small fish are sold at several points along the Norfolk coast as well as at Lynn. The same remark applies to mussels, and to so lamentable an extent has the above practice been carried that it is believed that now only one spawn mussel bed remains in the Deeps. In regard to shrimps, it appears to be very common for large parcels to be sent to London, where they are sifted, and the small thrown away. They are then re-measured before being purchased, so that the result is the loss of the carriage of the small shrimps, and no possible, even temporary, profit to the fishermen to compensate for the terrible loss to the future fishing.

"The committee need not remark upon the suicidal policy pursued by the fishermen, or upon the imperative duty devolving upon the corporation, who are constituted guardians of the fishery, to enforce the law upon the subject, so that the fishermen themselves may be better provided for, and that the town rates may be released from the many and pressing appeals from the north end [that is the fishermen's end].

"It appears that not only has an illegal fishing been conducted for many years past, but that a considerable sum has been invested by the fishermen in the purchase of the illegal nets now being used, and that if these nets were at once seized and destroyed it would be a cause of great temporary embarrasment, and in some cases of distress. Any summary proceedings, therefore, the committee do not recommend for the above reason; and also, because it may fairly be argued that the corporation has too long suffered the law to lie in abeyance, and thereby to some degree is responsible for the present state of the fishery.

"Upon a careful consideration of the whole evidence, and of the several acts and charters, and in the confident belief that any oversight of the corporation to be effective must be continuous as well as stringent, the committee recommend:

"That a hand-bill be published, setting forth the several penalties imposed by the Acts and Charters, and stating distinctly the size of the meshes of the several nets allowed to be used, which your committee will, with the sanction of the hall, hereafter determine upon, and also what shall be deemed 'unsizeable' fish in execution of the Acts.

"That such hand-bill shall state that after the expiration of months all illegal nets will be seized and destroyed, and that the full penalties will in every case be enforced, half being given to the informer.

"That any nets being made during the above period, otherwise than as prescribed, will be taken and destroyed.

"That advertisements be inserted in the Lynn paper, and also placards at the several points along the coast, where the small fish are landed and sold, explaining to agricultural gentlemen and others, that all unsizeable fish will be seized, by whomsoever they are held. Such advertisements to

KING'S LYNN.

E. L. Swatman.

27 Nov. 1863.

invite information to be given to the Lynn corporation, and stating that half of each penalty will be given to the informer.

"That in order to a future continuous supervision a permanent 'committee of the fishery' be appointed by the corporation; such committee be required to obtain information from time to time, by the employment of the police or of other agents, so as to enable the corporation as far as possible to enforce the law in regard to the Lynn fisheries.

"That the corporation of Boston be invited to co-operate with the Lynn corporation.

"In conclusion, the committee express a confident persuasion that if the above recommendations be strictly, yet kindly carried out, although the evil may not be prevented, yet that the result will be a greatly improved class of fishermen, with families well provided for by the exuberant produce of the Lynn channel and the Deeps, while the town will be relieved from a pressure upon its rates by a population abundantly provided for by the bounty of Providence.

"A draft hand-bill and advertisement accompany this report."

14,460. What is the date of that report?—It was presented in the year 1858. A copy of that report was sent to the corporation of Boston, and the people of Boston quite approved of it.

14,461. Were the different steps mentioned there taken in consequence of that report?—Yes, every one of them.

14,462. What has been the result?—None whatever.

14,463. The advantages expected by the committee have not been realized?—No, I believe the same evils complained of in this report still exist. They have not been remedied as far as I know.

14,464. What are the regulations. It is mentioned in that report that there are certain penalties imposed by charter, can you tell us what those penalties are?—Under the charter which enables the corporation to act in the matter they have certain powers; the expression in the charter is that they have power to regulate the size of the nets, and also to correct and punish such fishermen as are delinquents.

14,465. Has any attempt been made by the corporation to regulate the size of the nets?—Yes.

14,466. What has been the result of it?—None at all as far as I know.

14,467. Have the fishermen refused to obey the authority of the corporation?—I cannot say that they have refused to obey the authority of the corporation, but the difficulty we feel is how to enforce the regulations.

14,468. Practically they have refused to do so. As I understand you have given notice that such regulations would be enforced, and no attention whatever has been paid to that notice?—As far as I know, I believe not.

14,469. Have you employed anybody to carry out these regulations or enforce them?—We have no power to do it.

14,470. Therefore your whole authority seems to be a dead letter?—Yes; here is the handbill that we published in pursuance of the order of the committee. It was widely circulated, but it has had no effect. I believe the principal offenders are the farmers. They buy the small unsizeable fish and thus offer an inducement to the fishermen to take it.

14,471. The farmers could not buy the fish unless they were caught?—No, but the farmers readily take them, as they are very useful for manure.

14,472. Do you know what price they pay for these small fish?—I have no idea.

14,473. Probably we shall be able to get that from some other witness?—Yes, I think so; these small fish are very useful for manure, that is all I know about it, and the farmers continue to take them.

14,474. (*Mr. Lefevre.*) When were the regulations made by the corporation as to the size of the meshes?—About four years ago.

14,475. After that report was presented?—Yes, after the report of the committee was presented and adopted by the hall; the bill was then put out.

14,476-7. Were there no regulations previously to that?—No. On referring to the placard I find it is nearly five years since the regulations were made.

14,478. (*Mr. Caird.*) In what way do the corporation arrive at a precise limit with regard to the proper size of the nets?—Under the charter of King James they have power to regulate the management of the fishery.

14,479. Yes, but on what principle do they think it proper to fix the size of the herring nets, for instance; at seven-eighths of an inch from knot to knot?—I believe there are only two Acts relating to the fisheries, and they say that certain fish shall not be caught under a certain size. I believe the corporation were guided by those Acts.

14,480. You give here also the size of sole nets, shrimp nets, trim nets, and so on, might not herrings be caught in those nets as well as in a net the meshes of which are seven-eighths of an inch from knot to knot?—Yes, herrings of a certain size, no doubt, could be caught in those nets.

14,481. If the shrimp net is only five-eighths of an inch from knot to knot, and it is used at the same time as a herring net seven-eighths of an inch from knot to knot, would not the shrimp nets catch herrings which you say ought not to be caught?—Yes, but we say they ought not to take them.

14,482. What should they do with them?—Throw them overboard again.

14,483. Is there any large amount of money received by the fishermen for their take of immature herrings?—That is a mere matter of opinion.

14,484. You have no facts whatever to give us, or anything in the records of the town to show the gradual progress of the fishery?—All I know is that the matter has been freely discussed, and that great quantities of herrings in our Deeps are taken of an improper size.

14,485. I think you said in answer to a previous question, that you had not observed that the whole take of herrings has fallen off in consequence of catching these immature fish?—I cannot answer that question from any absolute knowledge of my own, and I may tell you the herring, as I before observed, migrates very much. All the herring caught here at this time of the year are consumed at Lynn, but there are immense numbers consumed at Lynn and the neighbourhood which are caught off Scarborough when we do not find them here at all.

14,486. Is the kind of fish that is used for manure of such a description that it is not suitable for human food?—Certainly it is not fit for human food, being so small.

14,487. Is it caught along with sprats; is there a sprat fishery here?—There is a great dispute going now among certain persons with regard to sprats and young herrings, but Mr. Cresswell knows much more about that than I do.

14,488. Is there any large quantity of sprats or fish called sprats caught here?—I believe so.

14,489. Are they exported inland?—Very likely they are. I should not be able to distinguish a young herring from a sprat, but I believe the difference is well known. I have heard that a great portion of the fish taken and used for manure here is the young herring, but whether it is so or not I do not pretend to say, the fish are so very much alike.

14,490. At what season of the year is the sprat-fishing followed here?—I really do not know, but I fancy in the winter.

14,491. With reference to mussels, I think you said that they were taken usually in an immature state when they were sold for manure?—Yes.

14,492. Are they taken from beds where the mussels are kept for bait?—They are not kept for bait, but the mussels that are sold for manure are taken from very considerable beds, and I am told that what were formerly very valuable beds have now been perfectly cleaned out.

14,493. Do you as a corporation enforce any regulations with regard to mussel beds?—The only way to remedy the evil would be to enforce a penalty.

14,494. And you have never done that?—No.

14,495. Are you aware that the mussel beds are falling off in their yield?—I have been told so.

14,496. Is there a large shrimp fishery here?—Yes, very large.

14,497. Are there any small immature fish of other kinds caught along with the shrimps?—I am not aware that there are; for instance, take the soles, the fishermen never take soles except in the summer months; we get none at any other time.

14,498. Is that because there are no fish here except in the summer months?—I believe they do not go far enough for them.

14,499. In the winter time?—Yes.

14,500. They are not found in your shallow water in the winter time?—No, we never see a Lynn sole in the water in the winter time.

14,501. How is it in the summer time?—There are plenty of them then.

14,502. There is nothing in the mode of fishing that prevents them coming in the winter time?—No. I think if the fishermen would go a little further down in the Deeps they would get soles.

14,503. Then you do not complain of the mode of fishing, except that the men do not go far enough out to sea?—No, not in regard to soles.

14,504. You said there is a large fishery of shrimps here?—Yes.

14,505. During what part of the year is it followed?—It extends throughout the whole year, but the great catch is in the warm months. The shrimps are taken in the spring tides.

14,506. Are the shrimps sent to markets in the interior of the country?—Yes.

14,507. By railroad?—Yes.

14,508. Is there a large supply sent inland?—Yes, I believe a great number of bushels are sent west.

14,509. Is it within your experience that the supply on the average has increased or diminished?—I should say it is pretty much about the same. The supply seems to be sufficient for the demand. A great quantity of shrimps goes now into the midland district instead of going to the London market.

14,510. You do not know from your own observation that there has been any decrease in the shrimp-fishing?—I am not aware of it; we have all we want here.

14,511. Has any complaint been made of the mode in which the shrimp-fishery has been carried on?—No.

14,512. There has been no objection to it on the part of the corporation?—No, I do not think there has been the slightest complaint in regard to the shrimp-fishing.

14,513. It is stated in the report of the committee which you read just now, that there are 70 Lynn boats and 150 men and boys employed in the fisheries at Lynn?—Yes.

14,514. Has that number increased or diminished of recent years?—I do not know, but I think it has increased.

14,515. Has the condition of the men employed in the fishery improved of recent years?—I think so; the principal men have greatly improved, and have made money.

14,516. Is the fishery on the whole prosperous?—I do not say that all are prosperous, but there are some good men among them.

14,517. Has there been any appearance of its being a decaying business, or of the fishermen themselves not being prosperous?—I think not, but I have heard that in the winter months the poorer classes among the fishermen sometimes throw themselves upon the poor-rates. Generally speaking, I should say that the class has very much improved; that is only my impression, however.

14,518-9. (*Mr. Lefevre.*) What is the earliest charter you have affecting the fisheries of this borough?—The general charter of King James is, I think, the earliest. There is a similar one at Boston.

14,520. Do you know of no charter earlier than that?—There is an earlier charter giving great powers to the corporation to deal with property, but the last and most important one in reference to the fisheries is the charter of King James.

14,521. Do you know of any charter earlier than *Magna Charta* vesting powers in you?—No, certainly not.

14,522. Do the charters to which you refer vest in you the soil of the Wash?—No, only certain rights.

14,523. Can you point out in the charter what the particular rights are?—The charter of King James gives us the Admiralty jurisdiction.

14,524. If the clause is a short one perhaps you will be good enough to read it?—It says, "That the said "burgh, and the port of the said burgh, and also all "and singular the Deeps vulgarly called Lynn Deeps, "and also all and all manner of places, parts, and "course of waters extending from the burgh aforesaid "unto a place called Saint Edmund's Ness" (20 miles northward of Hunstanton), "otherwise Gore End, and "from thence north and by west to another place or "sand called Long Sand, and from thence to another "sand called Whiting Sand, and from thence to "another place or sand called Torrington Breast, "otherwise Torrington Breast Sand, and from thence "to West Lynn, and from thence to another place "called Staple Wear" (seven miles up the river towards Stow), "and all and all manner of places and "parts within and upon the aforesaid sands, and to "the utmost flowing and reflowing of the waters "within the limits and boundaries aforesaid."

14,525. The utmost flowing and reflowing within the limits and boundaries?—Yes. "And also all and "singular within the precinct, circuit, and liberty of "the burgh and the port aforesaid, as well by land as by "water, from the time the said office of High Admiral "of England by death, forfeiture, or surrender, or by "any other way whatsoever, shall happen to be first "next void."

14,526. What rights do the charter give you over that space?—Do you mean what powers it gives us?

14,527. Yes?—The powers are contained in another clause. We have a right to regulate the fishermen.

14,528. The charter gives you a right to regulate the fishermen?—Yes; the fishermen and their nets.

14,529. Will you read the clause?—"Moreover We "have granted of Our more abundant special grace "certain knowledge and mere motion from Us, our "heirs and successors, and by these presents do "grant to the aforesaid mayor and burgesses of "the burgh aforesaid and their successors, that they "and their successors, from time to time that the "aforesaid office of High Admiral of England by "death, forfeiture, surrender or any means whatsoever "first next shall happen to be void shall and may "hereafter for ever have the correction and punish-"ment of all and singular the fishermen being delin-"quents in the burgh aforesaid and liberties of the "same and in the port limits and bounds aforesaid or "in any of them part or parcel of them and all their "nets, and also full jurisdiction and power of holding "pleas and courts aforesaid of all actions, controver-"sies, and demands whatsoever there by reason of "any thing or cause concerning fishing or the art "of fishing by any means according to the law and "custom of Our Court of Admiralty."

14,530. Is that the charter of the king, and is it confirmed by Act of Parliament?—It is the charter of King James the First.

14,531. Is it confirmed by Act of Parliament?—Yes, and it is the grant under which we act.

14,532. Have you ever taken legal advice in order to ascertain whether you can enforce any regulation made by you under the charter?—We have no doubt as to our power to enforce the right; but what we complain of is, that the persons who are the delinquents are so poor that virtually we cannot carry out the regulations.

14,533. Have you taken any legal advice as to your power of enforcing the regulations?—No.

14,534. Can you point out to me the Acts of Parlia-

KING'S LYNN.

E. L. Swatman.

27 Nov. 1863.

ment that relate to the fishing in the Wash?—I think there are only two.

14,535. Are they confined to the Wash?—No; they are two general Acts; they are very old Acts.

14,536. Will you be good enough to point them out to me?—They are referred to in the notice which was issued when the committee drew up their regulations. One is the first of George 1., but it does not say what the chapter is; and the other seems to be the 33 George 2.; the chapter is not given in either case. I believe the second Act is the 33 George 2. c. 27, and it is laid down in Burn.

14,537. Those Acts are general and not confined to the Wash?—No, they are not confined to this part at all.

14,538. Under these Acts, have you power to enforce a penalty against any person who takes fish under a certain size?—Yes, I think so, with regard to particular fish.

14,539. Have those penalties ever been enforced?—No.

14,540. Have you no means here of enforcing them?—The difficulty is, that we cannot detect the mischief of which we complain; it is so secretly done that we cannot detect it. For instance, the men will take a whole sweep of unsizeable fish and land it 20 miles from here, so that we know nothing about it at all.

14,541. Have you appointed any officer to inspect the fishing, and see that the fish are not taken unsizeable?—No; but the Preventive people have been spoken to and requested to interfere, and they say they have no power to do so.

14,542. Have you appointed any person on behalf of the corporation to do it?—No.

14,543. Why have you not done so?—I believe it has been on the score of expense. It would take at least three men to do all that is required.

14,544. Then there is no person appointed even to inspect the fish brought into the market here, and to ascertain whether it is unsizable or not?—No, I think I may state that we do not complain of what is brought in here, except with regard to mussels. What we complain of is, that they are taken away in the farmers' waggons and used for manure. As far as my knowledge goes we have nothing else to complain of with regard to what takes place at Lynn. Our great complaint is that mussels are taken and landed 20 miles from Lynn, and that we know nothing about these transactions until they are all over.

14,545. Are they caught by Lynn men;—Not by Lynn men alone but by Boston and Wisbech men as well.

14,546. Have you appointed anybody at Lynn, Boston, or elsewhere to inspect the fish brought to land here?—Some such appointment has been contemplated but has not been carried out.

14,547. In regard to mussels is there any Act of Parliament relating to their size?—I think not. I think there is no regulation except that which has been laid down by the Lynn corporation. They believe that they possess the power of regulating the size at which the fish shall be taken.

14,548. Then the regulation as to mussels is under your charter and not by Act of Parliament?—Yes, certainly.

14,549. Can you tell me where the mussel beds are that chiefly supply Lynn?—I can hardly answer that question. I think about 16 or 18 miles from Lynn, but there are mussel beds that belong to a private gentleman.

14,550. Are there any mussel beds vested in the corporation of Lynn by charter?—No. I think not, except whatever appears in their own jurisdiction.

14,551. Do you think that vests the bed of the mussel beds in the corporation?—I have no doubt of it.

14,552. Have you taken any legal advice upon the matter?—No.

14,553. But you have no doubt that the charter gives you power?—I have no doubt at all that we have the right to regulate the size at which the fish should be taken.

14,554. But with regard to the property of the mussel beds, is it vested in you?—I have no doubt about it. There are large quantities of mussels taken from an estate belonging to a gentleman living about 20 miles from here, and he licenses the men who take them.

14,555. Does he hold his rights under a charter?—Yes.

14,556. Under a grant from the Crown?—Yes.

14,557. Is that the only private mussel bed in the neighbourhood?—It is the only one that I know of.

14,558. Has there been any attempt on the part of the corporation of Lynn to confine their mussel beds to Lynn men, or may anybody go upon these beds and take the mussels?—I do not think there has been any attempt to confine the beds to Lynn men. The attention of the corporation has principally been directed to the taking of small fish. I have heard a calculation made as to the enormous loss occasioned to the fishermen themselves by taking unsizeable fish, and I believe that they admit the evil, but what they say is that they are obliged to do themselves what their neighbours do.

14,559. Is there anything in the charter that confines the fishing to Lynn men?—Yes, I think so, because we only seek jurisdiction in the limits confined by the charter.

14,560. I understand that the power is given to the corporation to regulate the fishermen, but does it confine the fishing itself to the inhabitants of Lynn?—No, I think the Boston people might go and fish as well as a Lynn boat.

14,561. Does it not leave it generally open to all the rest of the world?—Perhaps it may.

14,562. Have you observed any diminution in the quantity of mussels?—I believe the diminution has been immense, at least I have been told so; I do not know it as a fact from personal observation.

14,563. I see that in the notice issued by the corporation the mesh of the herring net is fixed at seven-eighths of an inch from knot to knot, are you aware of an Act of Parliament, the 6th & 7th Vict., which fixes the mesh of the herring net at one inch from knot to knot?—Yes, my attention has been called to that.

14,564. Then why in this notice do you fix the mesh of the herring net at seven-eighths of an inch from knot to knot?—What we contend is, that we have an exclusive jurisdiction in that matter.

14,565. Do you think that yours is a jurisdiction that overrides a subsequent Act of Parliament?—Yes.

14,566. Was it pointed out to you when you issued the notice that there was such an Act of Parliament in existence?—I can hardly say whether the Act of Parliament was pointed out to us or not. It is now five years since that notice was issued.

14,567. (*Mr. Caird.*) You mentioned a mussel bed which is the private property of some gentleman further down, are you aware whether the regulations he has enforced have led to an increased supply of mussels being obtained from his bed?—I cannot say that.

14,568. Do you know what the effect has been of the regulations he has imposed?—The licence is in very general terms and I suppose the mussels are used for the benefit of his adjoining estate; at least I fancy so; I do not know it of my own knowledge.

14,569. Do you happen to know whether the supply of mussels on that bed is increasing or diminishing?—No, I do not.

14,570. You cannot speak of it as a fact at all?—No.

14,571. (*Mr. Lefevre.*) Can you tell me why it is that the mesh of the herring net here was fixed at seven-eighths of an inch?—I do not know exactly what the reason was, but I think I am quite right in stating that it was fixed at that particular size after hearing the evidence of the fishermen themselves, and that it was assented to by them.

14,572. Then the fishermen were consulted previous to the issuing of that notice?—Yes.

14,573. Is there any inspection here of the nets used by the fishermen ?—Not that I am aware of.

14,574. Do the corporation take no means to inspect them ?—No ; and with regard to the size of the mesh they took it from the fishermen themselves.

14,575. Since the issuing of that notice there has been no attempt on the part of the corporation to inspect the nets or to enforce a particular size ?—No.

14,576. Are you aware whether a mesh of a smaller size is used for getting herrings here ?—The net of which we complain is a sort of stow net, which sweeps the whole bed of the river.

14,577. What is the size of the mesh of that net ?—I believe it is a mere poke, but I never saw one in my life.

The witness withdrew.

FRANCIS JOSEPH CRESSWELL called and examined.

F. J. Cresswell.

14,578. (*Mr. Caird.*) Can you define the boundaries within which the corporation of Lynn exercise their jurisdiction ?—I cannot define the boundaries to show the line precisely, but I believe as a general rule we take the right side and the Boston corporation the left of the Wash.

14,579. Can you say between what headlands on the Lincolnshire and Norfolk coasts the Wash may be supposed to extend ?—As a geographical question I think the Wash would extend almost as far as the Humber, and from there across to Cromer. The Lynn Deeps are between Winthorpe and Hunstanton point.

14,580. Does the corporation of Lynn claim jurisdiction over any part of the Wash indicated by headlands ?—They claim jurisdiction as far as the Well floating light, which I think is in a line with Hunstanton Point, and is also in a line the other way with King's Lynn. I do not know exactly what the landmarks are.

14,581. Is there anything in your charter that defines it ?—I think the jurisdiction goes to Saint Edmund Ness, Hunstanton Point, and to the Lynn Well floating light, and then straight to Lynn.

14,582. Have you from your own observation seen much of the fishing in the Wash ?—I have seen a good deal of fishing in this neighbourhood as an amateur for many years.

14,583. Have you practised it yourself ?—Yes.

14,584. Are you acquainted with all the different kinds of fishing practised here ?—I think I may say that I am with all of them except the smelt-fishing. I know very little of that.

14,585. Can you from your own observation say whether the supply of the different kinds of fish caught here is increasing or diminishing ? — I think the herring fishery used to be a great deal better than it is now ; in fact there is hardly any herring fishery at all now. During the last three or four years I have hardly seen any herring worth calling fish.

14,586. Can you remember the time when there were good fish here ?—I remember that about eight or nine years ago I caught a great many, so many that I could hardly get home with them.

14,587. Were they caught within the limits of the jurisdiction of Lynn ?—Close up to it ; I think at the mouth of the Boston Gut.

14,588. And are there no takes of herrings of a similar extent to be had at the same place now ?—Certainly not during the last four or five years.

14,589. Then with regard to herrings, within your own knowledge there has been a great falling off even within the last few years back ?—Yes, there has been a very great falling off indeed.

14,590. Do you know how it has been with regard to smelts ?—I should think it has been about the same as usual. They have never been cared for very much, and they remain much in about the same state as they were formerly.

14,591. Has there been any increase or diminution in the catch of sprats ?—Last year they got no sprats at all in the stow nets, but I think that is an uncertain fishery. Perhaps this year it will be very good, and then it will cease for a year. For the last four or five years the herring-fishing here has ceased almost entirely, and has become hardly worth following as a trade.

14,592. Has the catch of shrimps increased or diminished ?—I think the quantity of shrimps caught is much about as usual. They have always been neglected and small fish have been caught. Therefore it could not be expected that they could improve much.

14,593. Is there any diminution ?—I think not.

14,594. With regard to mussels, can you speak at all as to the supply upon the mussel beds here ?—The mussel beds are almost entirely at times raked up for manure, and a valuable trade to the north in the shape of bait has been very much injured in consequence.

14,595. Is a large proportion of the mussels on the beds taken for manure ?—Yes, a very large proportion indeed.

14,596. Do you think that one half of the whole catch is taken and sold for manure ?—I think a great deal more.

14,597. What price do they sell at ?—About 14*s.* or 15*s.* a ton or 100 bushels.

14,598. Do they sell at the same price for manure as for food or bait ?—They would be much more valuable for bait than for manure, but the men who sell the mussels for manure sell them of a very small size, some of them are only as large as a finger nail. They are taken, in fact, promiscuously, the small and the large together, and what we want is a clause which shall prevent them from selling them under a certain size.

14,599. Do the mussels sold in that way for manure realise more money than the selected mussels that are sold for bait ?—I can hardly say, because the mussels that are sold for bait require a voyage to the north ; but it has this advantage that it fosters a trade with many ramifications from which advantage might be derived. My own opinion is that a very lucrative and important trade might be carried on in that way. Whether the man who shovels up mussels for manure and sells them close at hand to the farmers gets more for them than the man who loads his vessel and sends it to the north in order to dispose of the mussels for bait, I cannot say.

14,600. Do the same class of men supply for bait and for manure ?—The men who take mussels as bait to the north must of course have a little more capital, something to buy a vessel with, while the men who take mussels for manure require little or no capital, but shovel up the mussels into an open boat, and carry them away, and they do not require anything like the capital required for the boats that take mussels for bait to the north.

14,601. Within your own observation, have you found that the quantity of mussels on the mussel beds, in consequence of the large number taken, is on the decrease ?—No ; I believe that nature is so prolific that however much we may reduce the number there hardly appears to be any perceptible decrease. However much we may abuse nature yet we still find that she restores the beds after a certain time.

14,602. Is there a sufficient supply for all the demand that arises in the shape of bait ?—I should say not at times, but some of the fishermen who are now present will be able to give you more definite information on that point.

14,603. You cannot say then whether there has been any scarcity of bait in these mussel beds ?—I cannot speak to that. I have heard that very much complained of, but I never took any mussels myself.

14,604. Have you ever seen mussels used as manure ?—Frequently.

14,605. Have you used them ?—No.

14,606. Are they useful as manure ?—Yes ; I believe they are very good indeed.

KING'S LYNN.

F. J. Cresswell.

27 Nov. 1863.

14,607. Are they put fresh upon the ground?—Yes, they are carted off and laid on the land. Sometimes they are mixed with other things. Three days ago I walked over some at Hunstanton which could not have been long upon the land; they did not smell very much.

14,608. How many tons do you think will be used in that way in the course of a year for manure?—I cannot say. Mr. L'Estrange, the gentleman who has been referred to as owning a private mussel bed, had nine or 10 carts that went down every tide in the spring tides. Those nine or 10 carts went down for eight days, and I daresay they would take at least 150 loads of mussels from one bed—Mr. L'Estrange's bed—in the course of a fortnight, so as to work the tides round.

14,609. Would 150 cartloads be taken in one fortnight?—Yes, I think so; but it is a mere surmise on my part. I have been a great deal at Hunstanton, and I have seen the carts go down.

14,610. Is that for the whole year round?—It appears to take place the whole year round; and I believe that I am rather under than over the mark.

14,611. Are all the mussels taken from Mr. L'Estrange's bed used for manure?—Yes, I believe all.

14,612. Has that continued for many years?—Yes, as long as I can remember, and I am 41 years old now.

14,613. Have the mussel beds shown any signs of diminution under this constant exportation?—I think not; but the mussels themselves very rarely arrive at that state which enables them to be used as a valuable trade for bait.

14,614. Do you know whether they are sold or not? Are they taken by the farmers on the estate of the gentleman to whom the bed belongs?—If they are not directly sold they are indirectly.

14,615. If they were not taken for manure would they be used for any other purpose?—I think not. That bed is so situated that vessels could not lie there. That part of the coast is not adapted for vessels lying on the shore; and the consequence is that they cannot make use of that bed for bait. We do not complain that the mussels there are used for manure, but what we do complain of is that the mussels from the mussel beds belonging to the corporation are taken for the same purpose.

14,616. There may be certain situations where mussels could not be used for any other purpose?—Yes, because it would be dangerous for vessels to lie on the shore; and as they are useful for manure I see no objection to such mussels being taken.

14,617. Do you know any regulations that could be adopted by which the supply of mussels on these beds could be increased?—I imagine that regulating the size at which the mussels may be removed would in a great measure meet the difficulty They ought not to be allowed to take them before they arrive at a certain stage of maturity.

14,618. Would you recommend that the corporation of Lynn should exercise the rights given to them under their charter, and enforce the regulations they have here?—I do not say that because I am a member of the corporation, but I should be glad to see such a law established and applied to all the coasts of the country.

14,619. But if you have the power already what greater power would you expect under an Act of Parliament?—A power that would apply generally would be very valuable.

14,620. Would you have the carrying of it out placed in the hands of a public fishery officer?—I do not think it would be necessary to have a public fishery officer. I believe if the Preventive men round the coast were told to exercise a certain amount of control they would be able to do so. They are constantly on the coast, and have plenty of time on their hands; and I think they would be able to meet the difficulty. They could see not only that mussels are taken of a proper size, but that the nets and everything else are of a proper size.

14,621. You desire to see some such regulations enforced by some public officer wholly independent of the corporation?—It is my desire as an amateur fisherman, and I believe it is the wish of all the fishermen that the nets should be so regulated that the greatest advantage should be obtained from them. We consider that we have very good gifts here in the neighbourhood, and we do not wish to see them abused.

14,622. But if you believe that it would be for the good of all the fishermen to enforce these regulations, as a member of the corporation, having the power to do so, is it not your duty to enforce them?—I do not think we have the power. We may have the power legally, but there is a great deal of difference between having a law and having the power to enforce it. We have no officer to send round, and we should not like to place ourselves in collision with the fishermen. There are also other difficulties that would arise. Look at the space that would have to be covered. Many people talk of the difficulty of preserving an estate of a few acres; but here we should have to look after hundreds and thousands of acres of wild sand and water. We could not exercise the control we desire. The only way to do it would be to draw a general cordon round the coast, so that nothing illegal or improper could take place; otherwise the men would go at night and set all the regulations at defiance.

14,623. Suppose there are such regulations as you at this moment have intimated, and that mussels which you say are illegal and improper, and below the size used for bait, were prohibited from being landed on the coast, would it not prevent all the mussels now landed from Mr. L'Estrange's bed being landed for a useful purpose?—Mr. L'Estrange's beds are in rather a different position. They are on a shore which cannot be approached by vessels in order to take them away, and they cannot be used for the purposes of bait.

14,624. Then cannot you see the difficulty there would be in establishing a general law?—I think that if there was a law made some distinction might be drawn between the two cases.

14,625. Are the mussel beds belonging to the corporation very extensive?—I think they must be.

14,626. Do you know the extent of ground they cover or the number of miles over which they extend?—I cannot say. They are on a particular sand, and they vary very much. They come up, I believe, very quickly and go very fast.

14,627. Are there any other kind of shell-fish found in these beds besides mussels?—No; but there are cockles and other things generally close to them.

14,628. Is there any cockle fishery here?—Yes.

14,629. What becomes of the cockles?—Some are put on the land, and some are sent to market. They are very good cockles, I believe.

14,630. Are there any oysters?—Not in our immediate neighbourhood, but there are some down about the floating light, and further out at sea. There may be one or two small oyster beds within our jurisdiction, but they are of no importance. Burnham is the nearest place where there are oyster beds. At the same time we have oyster beds in the Deeps, but I believe they are of no importance.

14,631. It was stated by a previous witness that there are plenty of soles caught in the summer months but not in the winter?—Yes.

14,632. What is the cause of that?—The soles go nto deeper water in the colder months.

14,633. Then that would account for the absence of soles here in the winter?—Yes, fully.

14,634. Is there any other reason, such as overfishing?—Yes. The reason some of us think there are not more soles is that the meshes of the nets are so small that a great number are injured which are not worth taking for food. I know as a sole-fisher myself that I have injured a vast number; whereas if I had been obliged to use a larger mesh they would not have been injured at all.

14,635. Yet notwithstanding you find that when the soles do come in there are plenty?—Yes, but we should like to find more. Our fishery has always been abused and has always produced the same results.

I believe it will continue to be the case until a new system is introduced.

14,636. Has there been any diminution in the quantity of soles caught here?—I think not; but they have always been treated in the same way.

14,637. Is there any increase in the number of boats and the number of people employed in fishing here?—I cannot say. I think there has been no diminution.

14,638. Has there been any increase?—I cannot say.

14,639. Has the size of the boats within your experience remained much about the same?—On the whole I think the boats have improved.

14,640. The nets and gear are they any better?—I think so.

14,641. Do you think on the whole that each boat gets a larger product than it did 10 years ago?—From what I have heard from some of the old fishermen I think they do not get as much, but the men themselves do not drink so much as they did formerly, so that they are able to spend more in their sails and boat.

14,642. So that there is as good a net profit now at the end of the season as there formerly was?—Yes.

14,643. Which kind of fishing on the whole yields the largest return to the fishermen here?—The staple fishery of Lynn no doubt is the shrimp fishery. The Lynn shrimp is noted even in London. They sometimes send away large quantities by train, I believe from a quarter of a ton to a ton and a half in a day. There are, however, many small shrimps caught, the same as in the case of soles. They fish with a small mesh, and the consequence is that they take the fish before they have a chance of arriving at maturity.

14,644. Could they catch shrimps without using such a net?—Other fish are generally caught in shrimp nets as well.

14,645. In fishing for shrimps, is it not the case that you catch other fish at the same time?—Yes, occasionally they catch soles, thornbacks, and flat-fish; but it is very rarely they catch soles, they go to other waters.

14,646. Is it not unavoidable that in fishing for shrimps you run the risk of catching other fish?—They always catch other fish to a certain extent.

14,647. Is there any means by which you could avoid such injury?—No, I think not.

14,648. Are there any regulations you can suggest for the improvement of the fishery?—I think that the size of the mesh for the different fish might be regulated so as to prevent the killing of immature fish.

14,649. Will you define that more particularly; to what size would you be inclined to limit the mesh?—The size of the mesh for a herring net should be seven-eighths of an inch from knot to knot. That size was arrived at after a great deal of mature consideration, and after pushing a number of herrings through the loops in order to ascertain the size. We considered that that was the most practical test we could adopt.

14,649*a*. And the conclusion was arrived at also in consultation with the fishermen?—Yes; and yet we are now told that, according to the present Act, the mesh should be 1 inch from knot to knot. But I think that the difference in size arises, to some extent, from the fact that we have different fish from the deep-sea Yarmouth fish. The herring we catch here is called "Leach's herring." It comes in the winter, about January, and is rather a smaller herring than the deep-sea fish. If 1 inch from knot to knot is the legal size for Yarmouth herring, I should say that a mesh seven-eighths of an inch from knot to knot is quite sufficient for ours.

14,650. Before we leave that question let me ask if herrings of that size caught in January and December are in a good condition?—Yes, they are in a capital condition. They spawn in February.

14,651. Are they full fish?—Yes; they are very round fish, and as full as possible.

14,652. Are they caught in any other season except December and January? Have you any spring or summer fishing?—Not that I am aware of.

14,653. Go on now to the next sized mesh?—The next is the sole net.

14,654. What size do you think that ought to be?—1¼ inch, and the shrimp net five-eighths in the cod or swinge part.

14,655. Is the sole net used on the same ground as the herring net?—It may be used on the same grounds, but one would not interfere with the other.

14,656. What do you say should be the size of the shrimp net?—Five-eighths of an inch.

14,657. Is that used on the same ground where the herrings are caught upon?—Yes, to a certain extent; but I do not think we catch herrings in them. We used to do so in former years when there were a great many herrings. They were apt to swim the net, but that has long been put aside.

14,658. What sort of a net do you now use for catching shrimps?—A regular trawl net.

14,659. Do you fish for them from a boat?—Yes; the net is pulled along the ground at the bottom of the water.

14,660. Is that net used on the same ground where you fish for herrings?—Yes, sometimes.

14,661. Is it not likely that a net with a mesh of five-eighths of an inch used on the same ground as a net with a mesh of seven-eighths of an inch would catch immature herring?—It may or it may not. No doubt, to a certain extent, it will injure the young fish.

14,662. But practically you do not find that much injury is done?—We do not complain of the injury done in fishing for shrimps. We complain more of the trim nets.

14,663. What is a trim net?—It is a net used in the river for catching smaller fish. It is five-eighths of an inch in the mesh, and it catches everything.

14,664. Is that a stow net?—It is very much like it.

14,665. Has it long been used here?—Yes.

14,666. Is it peculiar to this place?—It is an inland net, but it has crept down here.

14,667. Has it not been used here for many years?—It has been used here as long as I can remember.

14,668. Have you fixed the size for the mesh of that net?—Yes; five-eighths of an inch from knot to knot.

14,669. The same size as for the shrimp net?—Yes.

14,670. Have you a size for sprat nets?—No.

14,671. In what way are they fished?—By stowing, in which large bag nets are used where the current is rapid. They take every thing that passes along the water with the stream.

14,672. Are they not nets without a mesh at all? Are they not close nets?—The bag of the net is almost close, if not quite.

14,673. At what season do they fish for sprats?—If you call "sprat-fishing" what we call "stow-fishing," it takes place shortly from this time, in January and February, if there are any fish to be caught then; but I rather fancy that stow net fishing last year was a failure.

14,674. Are many boats engaged in stow-fishing?—Well, if one boat gets a little luck, and makes a good haul of fish, then all of them will go out.

14,675. But last year you say it was a failure?—Yes.

14,676. In previous years has it been an important feature?—I think two or three years they got a great many. About three years ago there were seven, eight, or nine smacks from here, and I know that one or two of them landed four or five tons of sprats and herrings in the course of a week's fishing.

14,677. Were they sent to London?—No, they were sold for manure.

14,678. Are they not used for food at all?—A few

KING'S LYNN.

J. Cresswell.

27 Nov. 1863.

of the better sort of fish are picked out, but the great body caught is used for manure.

14,679. (*Mr. Lefevre.*) Are they sprats?—Sprats, herrings, and other small fish.

14,680. (*Mr. Caird.*) Have you seen what has been caught in the stow nets?—Yes.

14,681. Have you observed other fish in the nets besides sprats?—Yes, I have seen all sorts of little fish.

14,682. Have you observed herrings?—I have been told that there is a distinction, but I cannot myself see what the distinction is between a herring and a sprat.

14,683. (*Mr. Lefevre.*) You cannot yourself distinguish between a herring and a sprat?—No.

14,684. (*Mr. Caird.*) Do you think these stow nets and stow-boats do much injury to young fish, and to the general supply of fish here?—I have no donbt of it, and I believe I am correct in stating that that is the feeling of the fishermen at large. They agree with me that the stow nets do more injury to our fisheries than anything else.

14,685. By the destruction of the immature fish?—Yes. The corporation decreed that the stow-boats should be altogether abolished on and after the 1st of March 1859; but we have no power to carry these regulations into effect. Even if we did abolish stow-boats in our own jurisdiction they might come from Boston, Hull, and Grimsby, and fish our waters. It would be a great injustice to our men to allow other fishermen to take fish from our waters when they themselves are prevented.

14,686. What quantity of fish is caught by the stow-boats in a season?—3 tons, sometimes more, a week, perhaps 4 tons; and I suppose occasionally, if the fishing goes on for 10 weeks, one boat will catch 40 tons.

14,687. Is not that a large figure?—If you think it is too large say 2 tons. There are 10 boats, and that would be 20 tons a week for the whole number; so if that goes on for eight weeks it will give you 160 tons altogether.

14,688. Do you think there have been 160 tons of immature fish caught in that way?—Yes, and I should say a good deal more too.

14,689. One hundred and sixty tons in a season?—Yes, in a successful season.

14,690. One hundred and sixty tons are caught by stow-boats and sold for manure?—Yes.

14,691. Do you think that that quantity will materially affect the supply of fish?—I should imagine so. In these 160 tons there must be myriads and myriads of fish that would probably arrive at a state of maturity afterwards if they were not caught.

14,692. What will the value of these fish be on the average to the fishermen?—They will sell them for about 14*s.*, 15*s.*, 16*s.*, or 18*s.* a ton, but say 16*s.*

14,693. Then it appears to be a small affair for the fishermen themselves, even if they were deprived of it?—A boat makes 2*l.*, 3*l.*, and 4*l.* a week by it. Some boats will get about 4 tons in the week, and occasionally they may get 1*l.* a ton for it. Thus they would make 3*l.* or 4*l.* a week. It is no very great matter, but it is something for them, and it keeps them going to a certain extent.

14,694. And it seems not to be a matter of great importance to agriculture if the whole supply is not more than 160 tons?—The farmers look very sharply after it. They get everything they can out of the river, and to a certain extent it is very important for them to have it.

14,695. But in your opinion it would be beneficial to the fisheries in general if the stow-fishing in the Wash were entirely prohibited?—Yes; of all kinds of fishing practised in this neighbourhood I think that is the most injurious. I believe that these estuaries are nurseries for fish. I do not believe that herrings go about much and change their position from place to place, but I am of opinion that they are constantly frequenting the same spots.

14,696. Would you prevent all kinds of stow-fishing?—Yes.

14,697. But how would you prevent it?—You might put a stop to it by requiring so very large a mesh to be used that everything would go through.

14,698. (*Mr. Lefevre.*) I believe you said just now that you do not think your charter gives you the power of putting a stop to stow nets?—I really do not know whether it does or not; but our charter is a dead letter. It is of no use.

14,699. You are of opinion that your charter is a dead letter?—Yes.

14,700. Have you taken any step to ascertain whether it is legal or vaiid?—The town clerk can answer that question better than I can.

(*Mr. Swatman.*) There is no doubt that the corporation have the power under their charter to regulate the fishermen; but then comes the question as to the remedy if their regulations are not adhered to.

14,701. I want to know what the objection of the corporation is to exercise their powers?—There is no doubt that they have power to bring an action against the fishermen.

14,702. (*To Mr. Cresswell.*) Why do you not exercise your powers?—If we were told that we had the greatest powers in the world perhaps we might not feel inclined to exercise them. It might be very injudicious to take any step that would bring us into collision with other towns, and with our own fishermen.

14,703. Are the corporation of Boston willing to co-operate with you?—Yes.

14,704. Is there any indisposition on the part of the corporation of Lynn to exercise the powers they possess under the charter?—There is no indisposition to do so that I am aware of, but we think we have very little power in the matter.

14,705. Have you taken any means to ascertain what powers you do possess?—I believe the law says that we actually have certain powers, but we do not exercise them because we have no wish to do so.

14,706. Why not?—Because although we may have legal powers we have no funds to enable us to keep a watch over vast tracts of sand and sea. At present we find it very different to preserve a few pheasants in a small area; and how much more difficult would it be to enforce obedience to our regulations over so large an extent of water as that which is comprised within the jurisdiction of the corporation.

14,707. Then it is a question of funds?—Yes, we could not do it without funds.

14,708. Then do you wish the public to undertake it for the corporation of Lynn?—Not for the corporation of Lynn but for the public of England. The public generally are interested in all that relates to the preservation of the fisheries along the coast. The destruction of immature fish is as bad for them as for us. What is required is a sweeping measure, and it would then not be difficult to enforce the regulations, as the Government have a body at hand capable of enforcing them without any considerable addition to the expenditure of the country.

14,709. Were you a member of the corporation that drew up the report that has been read to us?—No, I think not. My father was, and he is dead.

14,710. Have the corporation taken any steps to ascertain the comparative quanties of fish taken?—No, I think the corporation felt that with the exception of herrings the fishing is much as it used to be. It has been abused no doubt, but the results are much about the same as they always have been.

14,711. Is there any means of obtaining accurately statistics as to the amount and quantity of fish taken?—Not without great trouble and expense.

14,712. What kind of expense would be necessary?—That I cannot say.

14,713. Is there a large quantity of fish sent from here by train?—A great many fish are sent away by train. Many tons are sent away in the course of a day.

But all these points could be ascertained much better from other persons than from me.

14,714. Are any sprats sent off by train?—I have seen sprats put into the train, but I fancy they have been sent to the farmers in the neighbourhood.

14,715. Are the immature fish principally caught in the stow nets, or in any other way?—The stow nets seem to be very fatal to the herring, but all nets that have meshes of an insufficient size destroy young fish. They catch fish before they arrive at maturity, and destroy the value they would otherwise attain.

14,716. Would increasing the size of the mesh of the shrimp net materially affect the quantity of immature fish caught?—If you would have a large mesh you would only catch large fish, and you will allow the small fish in that case to become large ones.

14,717. The mesh of a shrimp net is small, is it not?—Yes, very small, but it is not used in the same place where other fish are caught. For instance, the shrimp net is not used in the same place as the sole net.

14,718. Then do not shrimp nets destroy a large amount of immature fish?—They destroy some, no doubt, but whatever sort of net is used a certain amount will be destroyed. I think, however, we should be careful not to destroy more than we can help.

14,719. I think you spoke of a great catch of herrings about five years ago?—About six or seven years ago there was a great catch.

14,720. Was that an exceptional year?—I cannot say. Herring-fishing at that time always used to be successful to some extent, and produced large quantities of fish, but of late years it has not been so.

14,721. Are fresh herrings brought in here from Scarborough and the Yorkshire coast?—Yes, some of our men go to the north, buy herrings, bring them here, and get money by them.

14,722. Has the price of herrings fallen or increased this year?—I cannot say.

14,723. You do not think that the diminution in the take of herrings may have arisen from its being no longer worth while to fish here in consequence of herrings being brought in large quantities from a greater distance?—The season of our fishing is not the same as that of Yarmouth or in the north. The fish come here at a particular time. They catch them in January and February, and sometimes in December. They come when they are especially valuable, not being caught anywhere else. There are men here who will tell you what price they fetch. I think they are sold for about 2*s.* a hundred.

14,724. What number of boats go out for herring?—Perhaps three or four boats may have gone out to try; but latterly the result has been that after fishing for a short time they have put their herring nets away. I go myself in a small way in the winter, and I have caught 150 or 200 a day with 10 or 12 nets. Those men who have to make a living out of it could not go on in that way.

14,725. Do you know whether the common herring is caught off here as well as the herring you have mentioned to us?—About a month or six weeks ago we caught a few herrings while drawing for smelts, but they were only odd fish, which we call stray fish.

14,726. The fish you catch here in the winter is a smaller description of fish?—Yes, it is smaller. I think you will find a description of it in Yarrell's "British Fishes."

14,727. Do you attribute the falling off to the use of stow nets?—I believe it is attributable to that. I formerly thought that the falling off applied to the sea generally, but I think I am wrong.

14,728-9. Do you think that the destruction of fish in the stow nets affects the supply of herring on other parts of the coast?—I did think so once, but I don't think so now. I believe the herring we have here are local, and that they go out and in but always return to this part.

14,730. Have you observed any diminution in the quantity of fish taken in the Wash?—Last year we took hardly any.

14,731. Previously to that?—Three years ago we had very much stowing.

14,732. Was there any quantity of herring the year after that?—We have had no herring for four or five years of any account.

14,733. How long has the stow-fishing been practised here?—I cannot say, but it has been practised to a greater extent during the last three or four years than it ever was before.

14,734. Has the stow-fishing been carried on here for a very long time?—Yes.

14,735. And yet you say you have only observed a decrease in the quantity of herring within the last three or four years?—The decrease I have mentioned may have been taking place for the last six or seven years.

14,736. Do your remarks with regard to the diminution of the herring apply principally to Leach's herring?—Yes, there is no other herring fishery here but that for Leach's herring. I think the stow nets are vastly increased in numbers, and there has been an increase in the boats too, but I could not say what is the positive fact without looking more into the matter. I am satisfied however that you will find on inquiry that the stow nets have much increased.

14,737. With regard to the mussel beds, I think you spoke of some mussel beds belonging to the corporation?—Yes, there are mussel beds belonging to the corporation.

14,738. Do you know of any charter that invests the soil of the Wash in the corporation?—No.

14,739. What do you mean then?—I mean that we have the power of exercising certain rights over them.

14,740. Do you know whether there are any other private mussel beds except those of Mr. L'Estrange?—No.

14,741. Has any diminution been observed in the mussels there?—I think not.

14,742. Notwithstanding the fact that they are sold as manure?—Notwithstanding the fact that they are sold as manure; but they are never allowed, I believe, to arrive at such a stage that they could be used for bait.

14,743. They never arrive at that stage on Mr. L'Estrange's mussel beds?—No.

14,744. I presume if he could sell them for bait, and if they were of any value to him on that account, he would allow them to grow?—The beds themselves are so situated that the mussels upon them could not well be used as bait; but I think that mussels are certainly of greater value for bait than for manure.

14,745. Is there a large export of mussels from Lynn for bait?—At times I believe a considerable trade is carried on.

14,746. And is there also a considerable trade in manure?—Yes, I believe so.

14,747. Would you put a stop to the sale for manure?—Yes, I would prevent mussels being taken until they reach a certain size.

14,748. Do you think it desirable that certain beds should be vested in the corporation, so as to prevent mussels being taken that are unsizeable?—As a member of the corporation, I do not want anything vested in us.

14,749. You do not think it desirable?—No, I do not see how we are to manage it.

14,750. (*Mr. Caird.*) Do these winter-caught herring fall off in quality as the season advances?—I think they are shotten about March.

14,751. They are caught in December, January, and February?—Yes.

14,752. Is the quality inferior in February to what it is in December?—I always found the fish equally good until they are just shooting their roes towards the end of the season.

14,753. (*Mr. Lefevre.*) Do you know if any attempt has been made by the corporation to enforce the legal mesh they define?—Not of late years. It was to be done by information, and nobody would inform.

14,754. The corporation took no trouble to appoint

KING'S LYNN.

F. J. Cresswell.

27 Nov. 1863.

inspectors?—No; the onus was thrown on an informer, and nobody liked to inform.

14,755. The corporation took no steps whatever to enforce it?—I cannot say; I was not a member of the corporation at that time.

14,756. Since you have been a member of the corporation have any steps been taken?—I would take no steps to enforce it; I think it would result in failure.

14,757. Then you do not recommend that steps should be taken?—No.

14,758. Even under the Act of Parliament?—No.

14,759. Have you fished with these illegal nets?—Yes, I believe I have.

14,760. Nobody has informed against you?—No, nobody yet; but I should be very glad to put them all on one side, and I believe all these men would too.

The witness withdrew.

C. Bouch.

CHRISTOPHER BOUCH called and examined.

14,761. (*Mr. Caird.*) Are you a fisherman here?—Yes.

14,762. Have you long been engaged in the fishing business?—I was brought up to the fishing business, and I have been engaged in it since I was six years of age.

14,763. At Lynn?—Yes; and my father, my grandfather, and my grandfather's father before me were in the same business.

14,764. Do you follow all the different kinds of fishing practised here?—Yes, all that are carried on in our Deeps and for several miles below, as far as the Dudgeon float.

14,765. Is the number of boats employed in the fishing here increasing or diminishing?—It is increasing, and they are much larger boats.

14,766. Can you tell us the number and kind of boats engaged in fishing here 10 years ago?—No.

14,767. Or 20 years ago?—No; I am not able to tell that.

14,768. Can you go back to any particular date when you can recollect the number?—When I was a boy there was about a dozen or 15 trimming boats, and as many small shrimp boats.

14,769. How many men were engaged fishing in each?—Generally one man and a boy, and sometimes there would be three in a boat.

14,770. How many boats are engaged in the same fishing now?—I do not know, I have not taken particular notice.

14,771. Has the number increased?—Yes, the boats are increasing every year. They increase by one, two, and three boats every year.

14,772. Are the boats larger?—Yes, much larger.

14,773. And is the fishing here better?—Yes, it is better than it was.

14,774. Do the boats take more fish in each boat than they caught formerly?—They take now less smelts, less buts, eels, plaice, and sandlings than they used to do.

14,775. What kinds of fish are caught by the trim nets?—The trim net is intended to catch smelts, eels, and buts near the upper part of the river, a few miles below Lynn, seven miles or so, up to Staple Wear, just at this side of Stowbridge.

14,776. What kind of fish are buts?—They are flounders.

14,777. Small flounders?—Yes. They catch in the trim nets dabs, plaice, smelts, and eels.

14,778. Do you catch anything else?—I caught a salmon about a fortnight ago.

14,779. Are the principal kinds of fish you catch with the trim net smelts, buts, and eels?—Yes; they are principally river fish. No other net can be used to catch them.

14,780. Are those fish increasing or diminishing in quantity?—They are not so large in quantity as formerly, but that is owing to the alteration in the upper parts of the river, and the improvements that have taken place there. I believe that is the cause that the herrings have not been so plentiful as they used to be.

14,781. What is the reason that the alteration in the upper parts of the river has had any effect in the matter—in what way has that diminished the supply of fish?—In former times the water used to wash over the land above our limits, and it was let off by sluices. Now, when the heavy floods or snow come it is taken off by sluices by means of steam engines which throw it off.

14,782. Am I to understand that by the introduction of a superior description of drainage the breeding grounds have been diminished in the upper part of the river?—The alterations that have taken place in the river have taken the breeding grounds away. They have made a straight level of it where it used to be sands formerly; and the water now that comes off the land is collected together into large sluices, and passing into the Deeps it spoils the water so that it is not suitable for herrings to come upon that ground. Mr. Cresswell is mistaken if he thinks that the use of the stow net has diminished the take of herrings. The real cause is what I have stated.

14,783. Has there been any considerable decrease in the smelts, buts, and eels during your time?—Yes.

14,784. Is the decrease a large decrease?—There are scarcely one fourth as many as there used to be.

14,785. Is there not one fourth the quantity caught now by all the boats employed?—I think not.

14,786. The take of that description of fish has considerably decreased here?—I consider that it has by reason of the spawn being destroyed.

14,787. And the removal of the breeding grounds?—Yes.

14,788. By drainage?—Yes; and by the trim net.

14,789. Do you attribute it entirely to the removal of the stagnant ponds in which the spawn used to be deposited?—It was only eels that bred there; but the water comes down here and keeps the herring away in the winter season.

14,790. What other kind of boats are there? You have referred to the trim-boats. There are shrimp nets and boats?—Yes.

14,791. Has the supply of shrimps decreased?—I do not think there has been any decrease.

14,792. Is there any increase?—I do not see that there is.

14,793. Are there more boats employed now?—It appears almost as if there was an increase. There are certainly no less.

14,794. Can you tell me of your own knowledge whether during your experience there are more boats employed now in fishing for shrimps than there were when you were a young man?—More than a quarter as many.

14,795. Does each boat catch as many shrimps now as it did formerly?—I think they do catch as many, but they bring them up smaller.

14,796. Are we to conclude that there is an increase in the quantity, more boats being employed than were employed some years ago?—I do not think that there is any decrease.

14,797. Are there more boats employed now?—Yes.

14,798. Do you consider that the total quantity has increased?—Yes, taking the quantity caught by the whole of the boats, I do not think that each boat catches much less (if it catches any less at all) than a boat used to catch.

14,799. Then if there is an increased number of boats there must be a larger take on the whole?—Yes.

14,800. In fishing for shrimps do you find that you destroy any other kind of fish in an immature state?—Yes, and so it is in other fishing practised in our

fisheries. I know of none in which that can be avoided to some extent.

14,801. With regard to the herring-fishing, has it increased or diminished here in your experience?—It has diminished.

14,802. There are fewer herrings taken now than were taken formerly?—Yes, since the freshets came down.

14,803. What do you attribute it to?—When I can first recollect there used to be none of the steam mills there are now in the upper part of the country; there are several mills now above our limits. There is nothing to throw the fresh water off, it all comes into our river and passes down our Deeps. Formerly there used to be herrings most frequently every winter. The quantity was very large, sufficient to make it worth a person's while to go for them. They are not as frequent now as they were then at the same season. Now the season Mr. Cresswell spoke of, when he referred to the large catch eight or nine years since, was a dry season; indeed it was so dry that scarcely any fresh water passed through our harbour into the Deeps at all.

14,804. In consequence of that dry season was there a larger take of herring?—Yes, it allowed the fish to come into the Deeps.

14,805. Have you observed that after a dry season there has been a larger take of herrings?—Yes.

14,806. Is that because there has been less fresh water come down into the salt water?—Yes. It does not turn the water fresh, but I imagine it spoils the flavour of it, and the fish do not like it.

14,807. (*Mr. Lefevre.*) The herrings will not come up if there is fresh water in the river?—No.

14,808. (*Mr. Caird.*) You have positively observed that after a very dry season you have got a good herring-fishing here?—Yes, if it is dry in the forepart of the winter until after Christmas the herrings will come up.

14,809. Is the herring-fishery here an important source of revenue to the fishermen?—Yes, of course the herrings are of great advantage to the fishermen if they will come. Several have nets now, more than they used to have in former times.

14,810. Are the young herrings caught by the stow-boats?—I have had stow nets myself, and I know that they are. The stow nets will sometimes catch all sprats, and there will scarcely be a young herring among them, when another day there will be many young herrings. The north country fishermen in their statements say that they have nothing to say against stow nets; neither have I.

14,811. You have nothing to say against stow nets?—No, and I have a paper in my pocket to the effect I have stated, that the north country fishermen do not object to them.

14,812. But you yourself think the stow nets are not injurious?—Yes. The sprats and young herrings leave our Deeps in the month of March. They all go out, with the exception of a few sickly ones, and go right into the sea again.

14,813. Do you not attribute the decrease in the quantity of herring to the quantity of young herrings caught by the use of the stow nets?—I consider that some of them might possibly come back again; but still I believe that what is caught by the stow nets does not injure the general body of the fish.

14,814. At what time do you fish in the stow-boats?—In the winter season.

14,815. Is that in the same months that you fish for herring?—No, we begin sooner with the stow net than with the herring net. We shall begin now very soon with the stow net, and we shall not commence with the herring net until after Christmas.

14,816. Do you imagine that some of the young herring that are caught by the stow nets would have grown into herrings by Christmas, so as to be caught by the herring nets?—No; I do not know, after they leave our Deeps on the coast, which way they go.

14,817. Is there always an interval between the end of stow-boat fishing and the herring-net fishing?—They generally leave off about one time.

14,818. When does the stow-boat fishing cease?—Generally speaking in March—in the fore part of March.

14,819. Do the stow-boat fishing and the herring-fishing go on at the same time?—They generally cease about that time, because the sprats leave the Deeps in the fore part of March generally.

14,820. Is the stow-boat fishing profitable?—Yes, very. I have known an open boat take 70*l.* worth of sprats at one draw.

14,821. (*Mr. Lefevre.*) Is there any stow-boat fisherman here?—Yes, I believe so.

14,822. (*Mr. Caird.*) Are you engaged in stow-boat fishing?—Not now, but I have used stow nets.

14,823. Then you speak of your own knowledge of stow-boat fishing?—Yes, of my own knowledge and experience. Perhaps I may say that I was at a meeting with reference to the fisheries about five years since, and I was not allowed to speak scarcely at all because I was not considered old enough. I was discarded altogether. It was said that my father was not a fisherman, and I was not allowed to say anything.

14,824. What is the value, in the course of a year, to fishermen of this stow-boat fishing?—I cannot tell you the value.

14,825. What is done with the fish?—It is now sold on the ground for manure, and some of it is sent away to different parts of the country—to London and elsewhere.

14,826. Do the fishermen get as high a price for fish for manure as for food?—No.

14,827. Then I presume that they endeavour to sell them for food if they can?—Certainly. I have had as much for fish for manure as 36*s.* a chaldron. That is the highest price I ever knew them to fetch.

14,828. What weight is there in a chaldron?—I do not know.

14,829. Is it upwards of a ton?—I think not, but it may be more. I really do not know what the weight is.

14,830. What price have you received for the same description of fish per chaldron for food?—I have known them fetch as low as 8*d.* a stone, and as high as 2*s.* 6*d.*

14,831. How much would that be for a chaldron?—I cannot tell you.

14,832. Is it a very much higher price than 36*s.* for a chaldron?—I should think it is a great deal higher.

14,833. Cannot you tell us whether it is or not?—It is much higher no doubt, but I cannot tell you the difference unless I was to reckon it up. I believe that 36 bushels are reckoned to a chaldron.

14,834. Then they would sell for a shilling a bushel for manure?—Yes, that is the highest price I ever knew given for them for manure.

14,835. What price per bushel would they bring if they were sold for food?—There are about 7 or 8 stones in a bushel. I believe that is about the quantity.

14,836. Then they would bring about four times as much for food as for manure?—Yes, I think they would.

14,837. Then practically the fishermen would not sell them for manure if they could find a market for them for food?—No; but whenever they get a quantity of them they cannot "rid" them.

14,838. Do you mean they could not sell them?—Yes.

14,839. Does it pay fishermen to go to the expense and trouble of catching them for a shilling a bushel?—Yes.

14,840. That is reckoned a very high price generally for manure?—Yes.

14,841. What is the ordinary price for manure per chaldron?—36*s.* is the highest I ever knew them to reach.

14,842. What is the lowest?—I do not know that they were ever sold by the ton for less than 1*l.* per ton.

KING'S LYNN.

C. Bouch.

27 Nov. 1863.

14,843. Is a large proportion of the whole catch sold for manure?—Yes, the greater part of it.

14,844. Is it used in the neighbourhood of Lynn?—No, the farmers in the country places along the Norfolk coast take it.

14,845. Does any portion of it go away by rail?—No, it is kept on the coast and landed in the different harbours. There are men who come on the ground with large boats, yawls, and buy it from the fishermen.

14,846. Do you know how many tons are sold for manure in the course of the year?—I cannot tell. I am not much of a scholar. All I understand is the fishing itself, and with regard to that I have been brought up to nothing else scarcely.

14,847. With regard to mussels have you yourself ever collected mussels on the mussel beds?—Yes; I have had a boat that would carry about 135 bushels, and I carried them away myself about 16 years since.

14,848. Is it 16 years since you gave up going there?—Yes.

14,849. Then you cannot speak of the present state of the mussel beds?—No, I have not been on them at all for three or four years.

14,850. Had you previous to that time constant experience of the mussel beds?—Not so much as some fishermen. There are others who have been more constantly at them than myself.

14,851. From your own knowledge can you say whether the mussels have been increasing or diminishing?—Last winter they were very plentiful indeed; but this winter (I only go by what I have heard the fishermen say) they are not so plentiful as they were.

14,852. Do you think that any regulation of the mussel beds could be adopted with advantage to the fishermen and the public?—I think there might be something done to benefit the fishermen and the public too.

14,853. What might be done?—Well there has been much said about the charter. Now I know that when I was but a boy, and since I have been grown up too, that if any strangers came to our place they were obliged to buy mussels, and they were not allowed to go and catch them for themselves. They gave as much as 6*d.* a bushel for them, and took them from Lynn fishermen. And if they had a mind to go out and catch them themselves they were obliged to employ Lynn fishermen to assist in loading their vessels at 5*s.* or whatever it might be each tide. That course was continued until at last one man refused to pay and set our magistrates at defiance; and the consequence has been that from that day strange boats never did anything of the sort again.

14,854. There was not a set price?—No.

14,855. But they consented to give 6*d.* a bushel?—Yes.

14,856. On condition that the Lynn fishermen should be employed at a certain price in raising the mussels?—Yes; they gave the market price.

14,857. For taking them off the beds?—For having them brought up and put on board.

14,858. Can you state whether the whole produce of the mussel beds has decreased in consequence of their being over fished?—There have been more mussels during the last few years than were ever known in the memory of man before, and there have been more mussel beds.

14,859. Do you know anything with regard to the sole-fishing here?—I have been fishing with a trawl and shrimp net, but I never caught a vast quantity of soles.

14,860. You have not practised that mode of fishing much?—No; less than any other.

14,861. Do you know whether the supply is increasing or diminishing?—I do not think there are as many as there were. I have heard my father say that he has caught as many as three bushels at one haul, and I do not hear of anybody doing that now.

14,862. (*Mr. Lefevre.*) Do you yourself fish during most of the year round?—Yes, I fish at the present time with a trim net, such as that which Mr. Cresswell mentioned.

14,863. Do you fish all the year round with a trim net now?—Yes, in different places according to the time of the year.

14,864. You do not go out into the sea?—They are not fit to go out into the sea with our boats. They would be cut all to pieces.

14,865. Have you a boat of your own?—Yes, and I fish with it. In the winter time scarcely anything comes nigh our reach except fresh-water fish, such as eels, buts, and smelts.

14,866. Have you any other nets except a trim net?—Yes, a drag-net.

14,867. Is that for the river?—For different parts of the Channel. No places in the river suit now. The nets are only used in the Channel. It has been said by the north countrymen that they are destructive in all waters, but that arises from the improper use of them.

14,868. Will you describe the nature of a trim net?—It is a sort of triangle net.

14,869. A triangular net?—Yes. There are three poles; one is about 22 feet, and there is one on each side about 18 feet; the net is spread out; it faces the stream, and the net is attached round the poles. It tapers narrower as it goes round, with a swinge to it.

14,870. What is the size of the mesh of the net?—About three inches is the length of the mesh in the wide part of the net.

14,871. And it gets gradually narrower?—Yes. It goes tapering off until it gets to a small mesh of the same size as we require for shrimp nets.

14,872. What is the difference between a trim net and a stow net; are they much the same?—Yes, they are much the same to stand the stream, but one is for fresh-water fishing, and the other for sea fishing.

14,873. In size are they the same?—There is a great deal of difference in the size. The trim net is much smaller and is used by smaller boats.

14,874. How long have you been out at sea?—I was fishing close to our harbour yesterday.

14,875. In the sea?—No, in the river, within our limits.

14,876. How long is it since you went out to the sea-fishing?—I have not been at that for several years.

14,877. How many years ago?—I hardly know. It may be 18 or 20. But sometimes we catch herring in the trim net. It is now more than 20 years since I was in a herring-driving boat.

14,878. Is it 20 years since you went for herring?—Yes, with a driving net, but I have got them with a trim net.

14,879. How many boats used to go out for the herring from Lynn then?—I do not think there were more than four that had driving nets went into Lynn deeps then. Now there are a great deal more; more than 20 I believe. But there never has been a good season since.

14,880. You recollect the time when only four boats used to go out?—Yes; no more than four at once.

14,881. Did those boats make great hauls of fish?—Sometimes they got 5,000 or 6,000.

14,882. The seasons were variable I presume?—Yes.

14,883. What distance did you go out into the Deeps?—Generally into the Boston and Lynn Deeps, about 20 miles or a little more.

14,884. That was about as far as you went?—Sometimes we might go 25 or 26 miles.

14,885. Was that about as far as you could go with your boats so as to be enabled to get back with your fish to the market?—They could go on further if they considered it necessary. If they thought they could have found herrings further they would have gone further, but they generally tried about that distance from home. Since then they have larger boats, and they have gone further.

14,886. Were you in the habit of meeting boats

coming from other parts of the coast fishing off the Deeps?—The boats from Boston and the Lynn boats fished generally in the Channel.

14,887. Are the Boston boats open boats as well as the Lynn boats?—They are half-decked boats, and they are large boats too. There has been a large increase in the boats there as well as at Lynn since I can remember. There is a great trade at Boston, even more than at Lynn.

14,888. How long is it since you yourself went fishing in a stow-boat?—20 years or more.

14,889. Is the mouth of the trim net square?—No, it is in the form of a triangle.

14,890. The pole, 22 feet long, that you mentioned is at the bottom, is it not?—Yes, and on each side there is a pole 18 feet long.

14,891. (*Mr. Caird.*) Is that trim net used anywhere except here?—Yes.

14,892. Where else?—At Wisbeach. They are only used in rivers for catching smelts; they are proper smelt nets.

14,893. Do you never use a drag net for catching smelts?—Yes.

14,894. Do you catch them better with the trim net than with the drag net?—We do not catch as many with the trim net, but we can catch eels which we could not catch without using the trim net. The drag net has been disputed by the owners of the trim nets and many were seized and taken away and should have been burnt.

14,895. Who did that?—The magistrates in this place.

14,896. When was that done?—Since I can recollect.

14,897. Is there any interference with the trim nets?—No. The owners of the trim nets disputed the drag nets because they said they destroyed too large a quantity at one time, and the drag nets were seized and taken away from several of the fishermen of Lynn since I can remember; but it did no good. It only caused strife and mischief, and then at last they came into the hands of Scott, the gaol keeper, and it so happened that a sack full of them was afterwards found in my father's boat.

14,898. How long is that ago?—I was only a little boy at the time.

14,899. Has there been any interference with the drag nets since that time?—They were disputed at the meeting here which I referred to a short time ago, and which was held about five years since.

14,900. What has been done in the river? Has the drag net been used for catching smelts ever since?—Yes.

14,901. Without anybody interfering? Have they been interfered with by your magistrates, or has the use of them ever been stopped?—No.

14,902. Are both modes of fishing practised now?—Yes; they are fishing together at the present time in a peaceable manner. The net is a useful net if properly used. I cannot say myself that a drag net should not be as good a net as any other.

14,903. Is the drag net used for that purpose of the same size as the trim net?—No, the drag nets are all of one size, and the trim nets vary in size. The size of the drag net mesh is about as large as a halfpenny, a halfpenny will pass through. The mesh of the trim net at the largest end is about 3 or $3\frac{1}{2}$ inches across, and it tapers narrower until it reaches the size we require in catching shrimps. If they were larger they would not hold shrimps.

14,904. Will a mesh that a halfpenny will pass through hold a smelt?—Yes.

14,905. But not unless it is dragged?—Yes it will.

14,906. Will the smelts not mesh in it?—Not unless the smelt is a very small one. A good-sized smelt—a smelt of five inches—will not pass through.

The witness withdrew.

THOMAS CARTER called and examined.

T. Carter.

14,907. (*Mr. Caird.*) Are you a fisherman here?—Yes, and I have been so all my lifetime; my father was a fisherman before me.

14,908. Do you practise all the different kinds of fishing that are practised here?—Yes.

14,909. Have you observed whether there is any kind of fish the supply of which has increased or diminished here?—I think we have had a diminution in soles.

14,910. Has that diminution been very large?—There has been a great decrease this last fall of the year. We have had a great diminution in the quantity of shrimps caught. The reason is, that we had a dry season in the summer time. The shrimps were on the mains, and the sun being very hot killed all of them. That is the reason that they have diminished. Where we got 20 bushels of shrimps in other years we have not got two this fall.

14,911. You attribute the diminution to the fact that it has been a dry, hot season?—Yes, a dry summer.

14,912. To what cause do you imagine the diminution in soles is to be attributed?—There is no account to be given of it.

14,913. Has there been any great diminution in soles?—Yes; this last summer we have caught nothing as compared with other years.

14,914. Has that diminution only occurred this summer for the first time?—No, a year or two ago. In fact we cannot account for it. Sometimes we have more one time than another; but this last season we have had a smaller quantity considerably than in any previous year.

14,915. Do you catch many small soles in your shrimp nets?—In the spring of the year we do.

14,916. Do you catch as many as to be an injury to the fishing when the season is further advanced?—We cannot avoid it. In the shrimp nets, in the spring of the year, the soles are so small that they get into the mesh of the net, and when we pull the nets aboard the soles are all dead. We cannot avoid it.

14,917. Do you catch them in any large quantities?—Not in large quantities. When we haul the nets aboard we get such a thing as a score, or perhaps not so many, may be three, four, five, or six.

14,918. What do you do with them?—They are all dead.

14,919. Do you throw them overboard?—Yes; they are of no use; they are only the length of the first joint of your finger.

14,920. Do you get more of them now than you did formerly?—No; they generally come up in the spring of the year.

14,921. Do they destroy more than they did formerly?—No.

14,922. Then it is not from that destruction in the spring that the falling off has taken place in the summer?—I have no opinion of that sort.

14,923. Have you observed that the herring has fallen off in quantity?—Yes, it has fallen off these last four or five years. During that time we have not had any takes to pay us.

14,924. What is the cause of that?—I am not able to say. The herring appears to be like every other sort of fish; we seem to think that when they come they come and when they go they go.

14,925. The decrease has not arisen from any mode of fishing you practise?—No. Some say they think it is all owing to the stow nets. Then we have heard the north countrymen say the herring is a herring in six months. Some say that the brood of a herring is a sprat, and that it becomes a sizeable herring in six months. Now, if the stow nets have injured these herrings why we should not have had herrings up every season as we used to have them, because stow nets have been used here ever since I can recollect. Why then should we not have them as we used to have them before?

KING'S LYNN.

T. Carter.

27 Nov. 1863.

14,926. Was there as much stow-net fishing a good many years ago as there is now?—Yes.

14,927. At that time was there plenty of herring?—Yes.

14,928. There has been no new mode of fishing adopted here within recent years that could have diminished the young herring, and thereby have caused a decrease in the herring fishery?—No.

14,929. There has been nothing but what has been practised for many years?—No.

14,930. No such result used to follow the stow-net fishing as appears to follow it now?—No.

14,931. Do you fish shrimps?—Sometimes I do. I fish for all sorts of fish.

14,932. Has the quantity caught here increased or diminished?—It has diminished this last fall of the year.

14,933. On the whole has the quantity diminished?—No, I think there has been very little alteration.

14,934. Taking an average number of years there has been little alteration?—There is just as good a fishing now as there used to be; I can see very little difference.

14,935. Have you had anything to do with the mussel beds?—Yes, that has been my work for years.

14,936. Do you fish them for bait or for manure?—No, I take them to be eaten. I pack them up in bags for the midland counties.

14,937. You do not take them for manure?—No.

14,938. Do you find a constant demand for them in the midland counties for food?—Yes, we have done so for some years.

14,939. Do you get a better price for them for food?—Yes.

14,940. Can you use the small mussels for exporting in that way inland?—No.

14,941. Do you select the better ones?—Yes.

14,942. Are they the same as are used for bait?—No, they must be better than those which are used for bait.

14,943. Are they the best quality of mussels that you get?—Yes.

14,944. Do you get a larger price for them than those fishermen who sell mussels as manure?—Yes.

14,945. Then why do not all the fishermen sell them for food instead of for manure?—They cannot get a trade for them, although they might get a trade for them if they could stop people from taking them off the scarps.

14,946. Will you explain that?—About three years ago the fishermen did not know where to go to earn a sixpence. We used to go down to the mussel beds tide after tide for a bushel. When it blew hard of course we could not get down. We were reduced to that state of poverty that we were forced to seek relief from the parish; they would not relieve us, however. I have myself known down the town as many as 72 men, women, and children going into the union three years ago in one night. The reason was that our gentlemen in the Town Council here had let a parcel of strange people come and take the mussels from us, and they had altogether neglected their own fishermen. We had five or six as nice beds of mussels as were ever seen by men, but in the fore part of the season the strangers came and clawed them from us, so that at Christmas we hardly knew where to get three or four bushels. We had what would have lasted us for years and years if the strangers had let them alone. As we picked the better mussels off and took them away the young brood would have been growing up and would have furnished a supply for us and our children afterwards. That would still be the case provided these strangers were kept away.

14,947. Do you wish to see some regulations enforced with regard to fishing on the mussel beds?—Yes.

14,948. What regulations do you desire?—To keep the strangers off and let our fishermen get them.

14,949. You want to have the use of them given entirely to yourselves?—Yes.

14,950. Would you increase the supply in that way?—Yes; if our fishermen had the mussel beds to themselves there would not be a fisherman who would want a bit of bread in the winter time. If they did it would be their own fault. We are to have the Great Northern Railway coming here, and then our fishermen might go musselling and they would find plenty of trade.

14,951. Would you send the mussels to the midland counties?—Yes.

14,952. There would be none left for bait in that case?—If our own fishermen who have bigger boats took them to the north country, for bait of course, they have as much right to do so as we have to take them to the midland counties and sell them for food. All I want is to see the strangers kept off, and then the fishermen here will not be beholden to the parish nor to anybody else.

14,953. Have you noticed whether these mussel beds are at all decreasing in their yield?—Yes, wonderfully.

14,954. Are there fewer mussels got from each bed than there used to be?—Three months ago where we had 10,000 bushels on our scarps, there are not 100 now; that is a great decrease. I have done nothing else but cockleing and musselling for the last four or five years.

14,955. Is it a recent market that you have found for mussels when you say that you send them to the inland towns?—Yes.

14,956. How long is it since you began to do that?—About three years ago.

14,957. Has the price of mussels very much increased in consequence of the opening of that market?—If it had not been for that market we should have sold mussels in Lynn for as little as 2*d.* and 3*d.* a bushel. In point of fact we should have sold them as low as anybody would offer us a price.

14,958. What do you get now?—6*d.* and 7*d.* a bushel.

14,959. What do you get when you sell them for bait?—I have heard the fishermen say that when they have been caught in strong northerly winds and could not get down with them they have sold them for 3*d.* and 4*d.* a bushel.

14,960. But what is the average price of them for bait?—6*d.* and 7*d.*

14,961. Is that after carrying them down to the north?—Yes.

14,962. Then you get a higher price here than you can get there for them?—Yes, when they send them down to the north country, to Scarborough and Whitby and other places, the average price is about 6*d.* or 7*d.* a bushel.

14,963. Do you think you would increase the supply of mussels on the beds if a restriction were enforced on the number of people who are permitted to fish them?—Yes.

14,964. What quantity of mussels is used for manure along the coast?—I do not know. There are a great many strangers that come and get them from Brancaster, Thornham, and other places.

14,965. Do many of your fishing smacks take mussels to Wells, Blakeney, and adjacent parts without their ever coming here at all?—No, not one.

14,966. Your own vessels do not do that?—No, I never knew anyone take mussels down there at all. I never knew one to be taken in that manner by Lynn boats.

14,967. Do other boats take them?—Yes, the Brancaster boats, the Thornham boats, and the Blakeney boats.

14,968. (*Mr. Lefevre.*) Have you yourself ever sold mussels for manure?—Yes, years ago.

14,969. Within the last three or four years?—No, not within the last six or seven.

14,970. You spoke of strangers coming from a distance to take them away?—Yes.

14,971. Where do they mostly come from?—Brancaster, Thornham, Blakeney, and Wells.

14,972. Do they sell them for bait?—No.

14,973. For manure ?—Generally they sell them for manure.

14,974. You are quite sure of that ?—I should say they always do so.

14,975. Do they take any pains to pick out the large mussels, or do they take them indiscriminately ?—They take them just as they get them.

14,976-7. Do you pick out the large mussels?—When the tide ebbs out we have a bit of a pull and pick them out for eating mussels, so that we know where the best lies day by day. We have a bit of a beacon with us and we can mark out one day what we intend to take the next. When we go there we know exactly where to look for the best of the mussels.

14,978. Do you think that the whole quantity of mussels found on the beach has diminished or not ?—Yes, it has diminished wonderfully.

14,979. The whole quantity ?—Yes, take them throughout they have diminished wonderfully.

14,980. Are the beds not as large as they were formerly ?—There are scarcely any beds at all.

14,981. Still strangers come and carry them away at present ?—Yes.

14,982. How long does it take for a mussel to grow to any size ?—What we are now getting to send into the midland counties are three years old; that is their age from the first spawning of them.

14,983. Then in the first instance the mussels are very little?—When the spawn first sets they are hardly visible to the eyes, but we can tell them directly a scarp is set, we have seen so much of them. I myself last year was engaged in picking the best I could find for the midland counties. In some spots the mussels lie and wash together so thick on the scarps that they are prevented from growing very fast. In other places where they only lie one mussel thick, they grow a wonderful sight faster.

14,984. Are mussels two years old fit for bait ?—Yes, they are at two years old.

14,985. Do the strangers take away mussels one year old ?—No, they could not get enough of them.

14,986. Have you seen Mr. L'Estrange's mussel bed ?—No, but I have heard talk of it. He will not let anybody go there except his own people; he stops everybody else from going on to the beds and I do not see why our gentlemen here do not do the same.

14,987. Do you think it would be advisable that some part of the sands here should be vested in private persons so as to give them an interest in keeping up the mussel beds ?—Yes.

14,988. Do you think the fishermen would pay something for leave to go on and take the mussels ?—The fishermen here ?

14,989. Yes ?—That I do not know. I do not know that they would have any right to charge us. We are licensed from Government. I was licensed myself at one time, but I have not got a licence now.

14,990. And did you have to pay anything for a licence ?—Yes, I paid a pound and sixpence some years ago. I have got my licence at home now.

14,991. Did that money go to the corporation ?—I cannot say, I paid it at the Custom House.

14,992. Was it a yearly fee or was it paid once for all ?—It was paid once a year in the first place, but afterwards we had our licences renewed and then we paid a pound and sixpence and we had them always afterwards.

14,993. How long is it since you went out yourself stow-net fishing ?—Five years ago.

14,994. And previous to that were you in the habit of going out every year stow-net fishing ?—I never was stow-net fishing as much as some people. From first to last I have been out about six or seven years.

14,995. Were you in the habit of going herring-fishing also at the same time ?—Yes.

14,996. I suppose you know the difference between a sprat and a young herring ?—Yes, and if you got hold of them in the dark you would know them too; we can tell them the moment we get hold of them.

14,997. Have you ever got any young herring with the sprats ?—Yes, the catch is not always confined to one sort, we catch for instance codfish, thornback, skate, and herring, and other fish all together.

14,998. Is there a large proportion of herring ?—Yes, sometimes. Sometimes we catch a large shoal of sprats, 10 or 12 chaldron, and there will be only one or two young herring among them, while at other times the proportion of herrings will be very considerable.

14,999. Will the young herring sell as well as the sprats ?—It all depends on circumstances. If they are of any size we bring them up for women to hawk in the town, and to send to the midland counties.

15,000. How long will they be ?—As long as my finger; they are not all of a size, they are what we call half-grown stuff; they will be about that size.

15,001. Is that the size of the generality of them ?—Yes.

15,002. Have you ever sold any of these young herrings as manure ?—Yes.

15,003. Is that because the price has not been good enough ?—It has been because we had no market for them to sell them in the town and we were forced to do something with them.

15,004. Have you sold sprats in the same way ?—Sprats are very little thought of in this town for eating.

15,005. Can you tell me what was the price you used to get for the fish sold as manure ?—I never sold much here of that sort of stuff; I have had very little of it in the latter part of my fishing. I generally used to take mine to a place called Hazel and Grimsby. Hazel is five or six miles above Hull.

15,006. Was it worth your while going out fishing for that purpose knowing that you could only sell the fish for manure ?—We have no sprat season here.

15,007. Was it worth your while to catch them for manure solely ?—Yes; it is like other things, if we got a good lot we used to sell them for manure, and if the take was only small then we brought them to market. We might get such a thing as a chaldron or a chaldron and a half of middling good stuff, and we should say to one another, "We have got a nice lot of stuff here, we "had better take them home to market." In that case we should make as much for a chaldron or a chaldron and a half as we should for six or eight chaldrons sold as manure.

15,008. How many boats went out with stow nets 10 years ago ?—Four or five.

15,009. What number are there now ?—I think there will be about 10 or 12. The reason of that is, that during the last two years if there were any sprats going at all, they had middling good seasons. The consequence was that other boats got nets as well. I think there was an increase of three.

15,010. During the eight years you went out with stow nets did you observe any decrease in the proportion of herrings as compared with other fish ?—No, I never observed anything of the sort more than the last year or two I was stowing. I never saw any difference at any other time.

15,011. You went out herring fishing during each season ?—Yes, I have been herring fishing, but not when stowing.

15,012. Is it carried on at the same time ?—Yes, the herring-fishing is carried on at the same time as the spratting.

15,013. How long is it since you were at the herring-fishing ?—Eight or nine years ago.

15,014. How many boats were there out after the herring then ?—I cannot say; 14 or 15 of our own Lynn boats, leaving all other boats out.

15,015. Do you know how many boats there are now ?—Not less than 20 have got nets now.

15,016. Were they all out this last year ?—No, nor during the last three or four years; some have not wet their nets for the last three or four years.

15,017. Do you catch the herring with a drift net ?—Yes.

15,018. Do you use any other net ?—No.

15,019. What is the size of the mesh ?—I am not able to say. I never interfered much with regard to the size of the herring nets.

KING'S LYNN.

T. Carter.

27 Nov. 1863.

15,020. What was the size when you went out fishing?—The same as it is now. You might get an old penny piece through the mesh I should say, but I do not know exactly. I never measured the size of the nets.

15,021. Do you find that you make a better livelihood by taking mussels, or by fishing herrings and sprats?—Of late years I have made a better livelihood by cockles and mussels.

15,022. Have you found less the last two or three years than before?—No, more this last two or three years than before.

15,023. More than in previous years?—Yes.

15,024. Then you have nothing much to complain of in regard to the wages you make?—We are not weekly men, we work by the share.

15,025. How many men do you share with?—Myself and two sons.

15,026. During the last two years you have not had any falling off?—No, the quantity has increased until now, but after this time we shall decrease wonderfully, and grow less and less.

15,027. Does the decrease of mussels give you any fears for the future?—Of course it does, you yourself would not like to see a man come and take a loaf out of your mouth.

15,028. But you have not suffered in pocket as yet?—No, but I fancy that I shall do so before long.

15,029. (*Mr. Caird.*) What proportion of your whole catch in a season's stow-net fishing is sold for manure?—I cannot tell, I cannot state any aggregate amount.

15,030. Is one-half sold for manure?—I should say so.

15,031. Three-quarters?—I should say not; it depends on what sort of stuff is caught.

15,032. Take the average of a season's fishing?—In that case I should say about half.

15,033. Is it a fair conclusion to come to that one-half of all the fish caught by the stow-boats is sold for manure?—There is not more.

15,034. Is one-half sold for manure?—You may say there will be that. Stow-boating is a curious fishing, sometimes we get a lot of all real sprats, and the next tide we get nothing but half-grown stuff, young herring.

15,035. With regard to cockle-fishing, do you use the same boats as for mussels?—They are caught close to the mussels.

15,036. Are they a large source of revenue to the fishermen?—Yes.

15,037. Do they yield as much as the mussels?—We have not quite as much trade for cockles as for mussels, but mussels are a deal of trouble to get ready for the market and cockles are no trouble at all.

15,038. What market have you for cockles?—Norwich is our chief market for cockles.

15,039. Do they sell for about the same price as mussels?—Yes, about 6*d.* a bushel.

15,040. Are they taken for bait?—No, they are taken for food; they are eaten.

15,041. Are the cockle boats increasing with regard to the supply obtained for them?—They are increasing at present, but there are several Grimsby boats now coming up and taking them from us.

15,042. Are they all of one age and size that are taken?—Yes, I think they are all spawned in about one day.

15,043. Then they differ from the mussels in that respect?—Yes.

15,044. Is there the same decrease in cockles that there is in mussels?—The same boats keep coming; the Yorkshiremen come and take them away so that we shall have none left by-and-by, and it will then be the same with cockles as it is with mussels.

15,045. There can be no regulation to prevent that except the taking is limited altogether to yourselves?—No, I think the gentlemen who live in the town should look after that matter.

15,046. Do you think that they ought to prevent the strangers from coming, and keep them to yourselves?—Yes, they claim the Channel, and if they claim the Channel they ought also to claim the mussel beds.

15,047. (*Mr. Lefevre.*) I understand you to say that you share with your two sons?—Yes.

15,048. How often do you divide—every week?—It all depends. Sometimes I send in my bill every week; there are about six strangers we send stuff to. We leave it all to their generosity whether they send the money or not. Sometimes we send the bill once a fortnight, sometimes once a week, and occasionally not for three weeks.

15,049. Are you engaged all the year round?—Yes.

15,050. What do you clear between you?—I have not kept any account. As we get our money in we share it. Fishermen never keep any account of what they share.

15,051. Cannot you give us any notion as to what you make in the course of a year?—No, fishermen are different to people engaged in any other trade; they work by shares, and when they get any money they share it among themselves, but they keep no account in a book of what they get.

15,052. How many men are engaged in this mussel and cockle trade?—I do not know.

15,053. About how many are there?—I should say about 25 or 30. There might be more if our people were so minded and would keep strangers away. In that case there would be plenty of trade for all, and no man would want a crust of bread; if he did it would be his own fault.

The witness withdrew.

S. Bone.

SAMUEL BONE called and examined.

15,054. (*Mr. Caird*). Are you a fisherman here?—Yes.

15,055. Do you follow all the kinds of fishing practised here?—I get nothing but a few mussels and cockles. Sometimes we go off for a few shrimps, but very rarely.

15,056. Does the mussel-fishing continue the whole year round?—It does with me.

15,057. Do you fish them alone?—Yes.

15,058. To what market do you send your mussels?—I sell mine in the town. What markets they take them to, those who buy them of me, I don't know.

15,059. What sized mussels do you sell, are they for food, for bait, or for manure?—For food.

15,060. Are they all sold for food?—Yes, all I catch.

15,061. Do you never bring in mussels that are sold for manure?—No.

15,062. Do you select the mussels that you bring in for food?—Yes.

15,063. Do you reject all beneath a certain size?—Yes.

15,064. Have you long been a mussel fisherman?—All the days of my life since I first went, when I should be about six or seven years of age.

15,065. Has the price of mussels increased or diminished in your experience?—I have known them as high as 1*s.* a bushel, and they are now reduced to 6*d.* a bushel.

15,066. Has 6*d.* been the average price for some years back?—No.

15,067. Is the price lower than it was?—I never knew them so low as they are at present.

15,068. Does that arise from there being a large supply?—Yes, it is in consequence of the large supply.

15,069. A large supply from the same mussel beds?—Yes, from the same mussel beds.

15,070. Is there not an outlet to the midland counties which did not exist in your earlier days?—Yes.

15,071. And yet, although there is an outlet of that kind there is a larger supply than there used to be?—There has been a larger supply but they are going

away now. I can see them decreasing. I can see them wasting away as it were. The land is left quite bare before us. It is just the same as taking turnips out of a field; when the turnips are taken away the field is left bare.

15,072. Do you expect the supply to diminish soon?—Yes.

15,073. Has it begun to diminish?—Yes.

15,074. Is it diminishing now?—Yes, it has been diminishing fast for the last two years.

15,075. And yet the price is keeping low?—Yes.

15,076. Do you fish upon any particular beds?—Sometimes upon one bed and sometimes upon another.

15,077. Do you go over all the beds that are frequented here?—I have travelled over all of them about these limits.

15,078. Has there ever been in any previous year a diminution in the supply arising from the beds becoming exhausted?—I can give no account of that.

15,079. Have you ever seen them run as far short as they have done now?—Yes.

15,080. Have you ever seen them run shorter?—Yes, so that I could not get six spats in a day.

15,081. Did the supply soon return?—No; I have found the beds to be bare of spawn for six or seven years.

15,082. Then there would only be a small fishing during the whole of that time?—Very small indeed. I had only a few cockles during that time. I managed to make a living out of the cockles, although it was only a small one.

15,083. How long ago is it since the beds were so much diminished in their yield?—About four years ago. The mussels we are getting now are about three years and a few months old, so far as I can guess.

15,084. Is that the right age at which they should be used?—Yes, if they were to be high on the main for 20 years they could not be as large as a middle-sized mussel gets in three years.

15,085. Do you expect that if the rate of fishing goes on as at present you will soon get no fish at all?—Yes, I do.

15,086. What remedy would you suggest to prevent that?—I would prevent the strangers from getting them.

15,087. Do the strangers take a large proportion of all the mussels caught on your beds?—Yes, I have known them take over 1,000 bushels in one vessel at a time.

15,088. Was that for bait?—There was some for manure. I never got any for manure myself, but I have helped others to get them for manure.

15,089. Do you think it advisable to put some restriction upon the mode in which the beds are fished?—Yes, I do.

15,090. What restrictions do you think would be advisable?—I can hardly tell you. It should be stopped as soon as possible.

15,091. The restriction you would impose would be to stop all the strangers from going on the beds?—Yes.

15,092. Do the strangers take mussels of a younger age than you take them?—Yes.

15,093. Is a large portion of the mussels taken on the beds by strangers taken for manure?—Yes, a very large portion.

15,094. Is there as much taken for manure as for bait?—If not as much in bulk there are more in number.

15,095. Is there as much taken for manure as for food?—I am not able to say that there is as much taken for manure as for food.

15,095*a*. If some restrictions were established that no mussels should be permitted to be brought ashore for manure would that be of advantage to the general yield of the mussel beds?—Yes.

15,096. (*Mr. Lefevre.*) How long have you taken mussels yourself?—Ever since I was six or seven years old.

15,097. Do you follow any other fishing?—Yes, I have fished for shrimps.

15,098. Do you make smaller wages than you were in the habit of making formerly?—No, not at present, but we are looking to the future.

15,099. To the future and not to the past?—Yes, to the loaves to come.

15,100. The decrease of mussels during the last two years has not greatly affected your receipts?—No.

15,101. Have you observed a variation in different years in the take of mussels?—Yes.

15,102. Sometimes you have a good year and sometimes a bad year?—Yes.

15,103. Do you think the decrease during the last two years is to be attributed to having bad years, or is it in your opinion due to the fact of the mussels having been carried away by strangers?—I think the strangers are doing us a wonderful sight of harm; they are doing us a great deal of harm.

15,104. When did you observe the strangers come for the first time?—I don't know. I think the whole year round, but I never took any notice of that.

15,105. Have you observed them in other years also?—Yes.

15,106. How long past?—Ever since I can recollect.

15,107. Then they did not come for the first time some three or four years ago?—They have been here every year as far back as I can recollect when there has been a good stock for them to come to. When there was none then they would not come.

15,108. Why should you be more alarmed now than you were five or six years ago?—There is the same God to help us now that there was then.

15,109. You had the same grounds of alarm for the future then as now?—Yes.

15,110. But still you did not find that the bad result you now anticipate really did follow?—No further than that we have been flung upon the poor's box.

15,111. I think you said your wages for the last two or three years had been as good as ever they were?—Yes, they have; so that I have not been on the parish box; but that was not the case before.

15,112. But that was due to a bad year?—Yes, to having no mussels and no herrings.

15,113. It was entirely due to the badness of the season?—No, we attributed it to the strangers cutting the stuff away.

15,114. (*Mr. Caird.*) When did the strangers first begin to take mussels from these beds?—Ever since I recollect and I have no doubt even before that.

15,115. Has it only been recently that the beds have been very much run out in consequence of the strangers coming here?—Yes.

15,116. They have been in the habit of coming here as long as you can recollect?—Yes.

15,117. But did they not do damage to the fishermen in former times?—Not until they finished the beds up.

15,118. Then they left?—Yes, until more mussels came.

15,119. In answer to a question from me at the beginning of your examination you stated that you had a larger supply than you had had for a long time?—Yes.

15,120. And that therefore you had less price?—Yes.

15,121. And yet the strangers have been in the habit of coming very recently and are coming now?—Yes; no longer ago than yesterday I was upon the Scarps and saw one of the boats from Scarborough there.

15,122. (*Mr. Lefevre.*) What do mussels fetch for manure?—I think 12*s.* or 14*s.* is about the general price paid for them.

15,123. Is that per cwt?—No, 100 bushels corn measure.

The witness withdrew.

KING'S LYNN.

E. L. Swatman.

Nov. 1863.

EDWARD LANE SWATMAN re-called and examined.

15,124. (*Mr. Lefevre.*) You heard what one of the witnesses stated about the town council having at one time charged something for a licence? What in your recollection are the facts of the case?—My impression is this that many years ago the corporation used to license fishermen. They paid a common licence duty at the Stamp Office, but that has gone quite out of date.

15,125. Did they take any means of preventing other persons from going to the mussel beds?—The only thing I know of within my recollection is this, an action was brought by the corporation against a certain dredger of oysters. It was before my time, and the corporation were defeated.

15,126. Was there any decision in law upon it?—Yes.

15,127. Have you any account of it?—Yes, I have all the papers connected with it. I was not in my present office at that time. It was in the time of Mr. Pitcher, my predecessor, who is now in the room.

15,128. I presume it was decided that the corporation had no right?—It was an indictment brought by the corporation against certain persons. It was defended by somebody—I don't know who they were—and the decision was that the people had a right to do that of which the corporation complained. I believe that was the whole issue, but it was before my time.

15,129. I presume, therefore, it amounted to a decision that the people of Lynn had no exclusive jurisdiction over the fisheries?—No, I don't say that at all.

15,130. Then was it a decision that there is no right on the part of the corporation to exclude strangers fishing within their jurisdiction?—I can't answer the question off hand, but my impression is that we went a little beyond our jurisdiction.

15,131. Beyond the limits of your jurisdiction?—Yes.

15,132. Then it did not amount to any decision of your rights within those limits?—No, no one has a right to interfere with us within our jurisdiction.

15,133. Do you think that within the limits of your jurisdiction you have now power of excluding people from fishing?—Yes, certainly.

15,134. Do you think it advisable that the town should exercise that right?—I offer no opinion upon that. With regard to the case I have referred to, I think it is within the memory of my friend Mr. Pitcher who sits beside you, and he can contradict me if I state anything wrong, but I believe we went a little beyond the limits of our jurisdiction.

15,135. You have heard some of the witnesses express an opinion that strangers should be prevented from going to the mussel beds and taking mussels within the limits of the jurisdiction of the corporation of Lynn?—Yes.

15,136. Do you think it advisable that you should do that?—Yes, I see no reason why strangers should be allowed to take our mussels and fish to other places.

15,137. Do you think the corporation of Lynn would be ready to enforce regulations to that effect?—Yes.

15,138. Then why don't you do it?—We can only do it under legislative powers.

15,139. You don't think your charter gives you that power?—No; the remedy is worse than the disease. What is the use of suing a poor fisherman? Then there is always the difficulty of detecting them. For instance, if a Grimsby man comes and takes fish out of our water we don't know it at the time.

15,140. But do you take any means to ascertain whether they do so or not?—No.

15,141. Have the corporation in point of fact done anything towards limiting the number of people?—No, on account of the expense. It would take two or three men to do that.

15,142. The corporation are not ready to go to that expense?—I don't say that; I have no orders to say that.

15,143. But they have not done so?—No, they have not done so.

15,144. (*Mr. Caird.*) You don't employ any water bailiff or officer of that sort to look after your rights?—I believe there used to be one.

15,145. Did he interfere to prevent the strangers coming?—No; the old water bailiff never went beyond the town of Lynn. The nuisance of which we complain is further seaward.

15,146. Do you think it desirable that certain mussel beds should be absolutely vested in the corporation?—I would not suggest that because people don't like to suggest such arbitrary powers, but the corporation should have some controlling power to see that those people don't offend against the law, if you can understand that. The corporation don't seek to exercise such powers.

15,147. By offending against the law do you mean that people should not be allowed to come from a distance upon the mussel beds belonging to the corporation of Lynn?—My own opinion is, that it would be a most excellent thing for the country if the legislature would pass an enactment binding people not to offend against the law, and at the same time lay down that law.

15,148. I want to know what you think the law is at the present moment?—I know what our law is, but we can't carry it out.

15,149. Do you think that under your charter you could prevent strangers coming from a distance fishing?—I have no doubt we could if we were prepared to pay the costs, but I want to have a positive enactment to save the public from the expense. Fish is a most useful article and my wish is to see an enactment passed that will give the public the benefit of the fish, and prevent persons from taking it in an improper manner.

15,150. I want to ascertain if you think it desirable that the public should interfere to prevent strangers fishing within your jurisdiction; is that what you want?—Yes, I think so.

15,151. What advantage would it be for the public to do that?—I merely give my own individual opinion but I see no reason why a fishing boat from Yarmouth or any other place where they have their own fishing grounds should come and fish within our jurisdiction.

15,152. Do you think it is the interest of the public that the fish of Lynn should be caught by the people of Lynn?—I merely give my own opinion, but I see no reason why fishermen from Yarmouth or Lowestoft should come and draw their trawl nets over grounds in our jurisdiction.

15,153. At the same time you think the corporation of Lynn are not ready to go to the expense of preventing it?—I don't exactly say that, but I believe I am correct in stating that the corporation are not prepared to prosecute persons who offend against their regulations.

15,154. Against their regulations?—Yes.

15,155. They desire that the expense should be incurred by the state or some other persons, and that they should have the benefit of it?—I don't quite go that length, but there are two or three members of the corporation present and perhaps they may express their opinion on the matter.

The witness withdrew.

The inquiry was adjourned until Saturday the 28th of November, at Boston.

Boston, Lincolnshire, Saturday, 28th November 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman).
Professor HUXLEY, F.R.S.
G. SHAW LEFEVRE, Esq., M.P.

SOLOMON HACKFORD called and examined.

BOSTON.
S. Hackford.
28 Nov. 1863.

15,156. (*Mr. Caird.*) You hold the office of water bailiff here, I believe?—Yes.

15,157. You have held it since 1860, I understand?—Yes.

15,158. By whom were you appointed?—By the corporation of Boston.

15,159. What is the nature of your duties?—To inspect the fisheries and see that the fish are taken of a proper size, and also to protect the mussels and see that the brood are not taken away.

15,160. Over what extent does your jurisdiction extend?—As far as the privileges of the borough of Boston extend.

15,161. How far do those privileges extend?—To the Boston Outer Knock and the buoy called the Gat buoy, away to the entrance of Lynn Well.

15,162. Does that include the whole of Boston Deeps?—Yes.

15,163. Over how many miles does the jurisdiction of the borough of Boston extend?—I can't form any idea of that.

15,164. Can you give us the length of it in miles, and also the breadth?—It would be something like from 24 to 25 miles from Boston to the Outer Knock.

15,165–6. Over the whole of these 25 miles are there banks with different kinds of shell-fish upon them?—Yes.

15,167. Where are the banks on which the mussels and other shell-fish are found?—They are on the Toft and in the Gat, which you will see run in a parallel line south-south-east.

15,168. What is the Toft?—There is the Toft beacon, on a high sand bank. There is also a sand bank at the Gat, and another sand bank called the Roger.

15,169. Are the whole of those banks dry at low water?—Yes, all those you see marked prominently on the chart.

15,170. Are all the banks where mussels are found dry at low water?—At spring ebbs they are.

15,171. You say that your duty is to superintend the mode of catching the different kinds of fish that are caught here; what are the different kinds of fish caught here?—Chiefly soles and shrimps. There are some few buts and plaice, but they are chiefly shrimps.

15,172. Are there any shell-fish?—In the shell-fish department there are mussels to a great extent, and likewise oysters.

15,173. In what state did you find the mussel beds when you first came to take charge of them?—They were nearly exhausted.

15,174. Was that in 1860?—No; in 1859.

15,175. What measures did you adopt for the purpose of increasing the supply of mussels from these beds?—I had instructions from the Board to see that the mussels brought up were riddled on the beds, but I found that to be impracticable except to a certain extent. We then used to riddle them in the boats. There was a great deal of brood among them, and if we had continued to take them without riddling them we would have exhausted the supply. The beds have now been restored to an enormous extent.

15,176. Did you commence that immediately on your appointment?—Yes.

15,177. What did you do?—I got several warrants against the men who took them away for bait to Lynn or sold them for manure. I applied to the magistrates on several occasions and they granted me summonses; but ultimately there was a doubt as to their authority, and it fell back again to the old system of bringing the small mussels and selling them for manure. They have been sold in that manner to a great extent in Norfolk and Suffolk, and they have also been sold for bait to the north country fishermen.

15,178. Did you endeavour to put a stop to that?—Yes.

15,179. Did you put a stop to it?—Yes.

15,180. For how long?—For six months.

15,181. Was the effect of that stoppage to produce a large increase in the quantity of mussels?—Yes, the increase arose partly from that, and partly from the re-spawning of the old mussels which are laid there. There are now some thousands of acres of mussels there.

15,182. Is there an inexhaustible stock?—Yes.

15,183. Have these thousands of acres increased gradually since you had charge of the beds?—Yes, three or four years ago mussels were very scarce, but now a man may load a large boat in one tide.

15,184. What proportion may be sold for bait and what for manure?—I think about 100 tons a week go away on the average for bait. Perhaps there may be more, and even a greater amount for manure.

15,185. What do the 100 tons a week go for?—For bait.

15,186. And a greater amount for manure?—Yes, there were four small smacks here the other day, getting 30 tons each for manure.

15,187. Is there any large quantity taken for food?—Yes.

15,188. Where are they brought to?—They are brought to Boston.

15,189. What quantity may be taken for food?—I can hardly speak to that. I think there may be more than 100 tons a week brought here.

15,190. Then altogether the beds seem to yield about 300 tons a week?—Yes, at present.

15,191. Are the quality and age of those taken for bait and for food about the same?—Those taken for bait and for food are about the same.

15,192. Are those taken for manure young fish?—They take the young brood, and destroy the beds.

15,193. Where do they take them to for manure?—To Brancaster, Thornham, Burnham, Wells, and Blakeney.

15,194. Have you endeavoured to stop them taking mussels for manure?—I reported them, and they were induced to send and stop them. Notices were also sent to the corporation of Lynn, who acted at one time in union with us.

15,195. But you only stopped them for six months?—Yes.

15,196. When did they resume taking them for manure?—In the middle of 1860, when the season commenced, they began taking them for manure again.

15,197. In 1860?—Yes, I think I was appointed in 1859, and in the latter part of 1860 they began again.

15,198. Have they taken them ever since?—Yes.

15,199. And yet there is an enormous supply at the present moment?—Yes.

15,200. Has it sensibly decreased the beds?—I think it will do so if it is allowed to continue. They go on taking the small spawn.

15,201. Have you observed any diminution up to the present time?—Not with regard to big mussels, but they have cleared the beds they went on. In the course of three years the mussel becomes full grown.

15,202. Has there been any increased demand for bait since you took charge of the beds?—Yes, many tons go away now by rail from Boston down to the northern ports.

15,203. To be used for bait?—Yes.

15,204. Has there been any increased demand for

BOSTON.
S. Hackford.
28 Nov. 1863.

mussels as food?—Yes, it seems to me that every smack that requires employment can find employment on the mussel beds.

15,205. Every year is the quantity taken from the beds increasing?—It has increased during the last three years.

15,206. Do you think that if there was a provision preventing mussels from being taken for manure the beds would admit of a constant increase of mature fish?—Yes.

15,207. Is that your meaning?—Yes.

15,208. If you prevent these men taking them away for manure, the beds will give a plentiful supply?—The taking of them away for manure is the cause of a very great destruction.

15,209. Do you complain of any other damage done to the beds in addition to the taking away of the mussels for manure?—No, when they are gathering the big mussels they riddle the little ones from them, and leave the brood on the railway stage.

15,210. Where is that?—On a stage provided by the railway company. They bring them on to the stage and riddle them. The small ones pass through the riddle, and the big ones only are taken.

15,211. What is done with the brood?—I believe it is sold for manure in the town.

15,212. At the railway stage?—Yes.

15,213. If some system could be adopted whereby they could be riddled on the beds would that destruction be prevented?—Yes, but I don't see how that could be done. When the restrictions were first imposed here, they did riddle them on the beds for a time until I got my summonses. They began then to doubt the authority of the corporation of Boston, and when the magistrates would not grant any more summonses they resumed their old habits.

15,214. If some regulation were established by which you could be enabled to enforce the process of riddling them on the beds, where they are caught, so that the brood would be placed back again on the beds, do you think that an advantage would arise from that?—Yes.

15,215. Do you think that would be a protection to the beds?—Yes.

15,216. If none of the brood were taken for manure would that remedy the complaint you have to make?—Yes, I would also prevent them being taken for manure at all.

15,217. Has the take of soles fallen off within your experience?—Yes, a great deal.

15,218. To what do you attribute that?—To the increased number of boats and the destruction of small fish by the trawl. They take them away by thousands. I stopped them once, but still they smuggle them up.

15,219. The small soles?—Yes.

15,220. When are they caught?—It begins in May, and lasts from then up to about this time of the year.

15,221. Have the soles perceptibly decreased within your recollection?—Yes, materially.

15,222. Are they caught in any other season except the summer months?—No.

15,223. Are there a greater number of boats employed in catching them than there were formerly?—Yes.

15,224. They don't get as much?—No, not by a long way.

15,225. Have you any facts you can give us that will prove that to be the case?—Yes, I was in the sole-fishery myself some few years since, and I know that fishermen could bring more into the market than they could vend. They could not sell all they got sometimes, but now that is not the case.

15,226. How many boats are employed in the sole-fishing now?—All the shrimp boats are comparatively engaged in the sole-fishing because they catch them in the small shrimp nets with which they trawl.

15,227. Can they get such soles in the shrimp net as they can sell in the market?—Yes; a few.

15,228. What do they do with the small soles?—If they can get them out of the way of the inspector they do so. Generally they try to sell them or take them home. If they can smuggle them away they do.

15,229. Do you attribute the falling off in the catch of soles to the small mesh?—No, rather to the way in which they are taken, and to the many thousands of small soles that have been destroyed.

15,230. How are they destroyed?—When they take these unsizeable fish, instead of heaving them back into the sea, they skin them and sell them as well as they can.

15,231. How would you remedy that?—I would impose a fine on them. If you caught two or three and fined them, that would soon stop all the rest.

15,232. You think that if you had authority to enforce such regulations as the corporation think proper to adopt you would put a stop to this injurious mode of catching soles?—Yes. Here are the instructions I received from the corporation (*producing a placard*).

15,233. (*Mr. Lefevre.*) Is that the same as that issued by the corporation of Lynn?—Yes, I believe it is almost a fac-simile. I applied to the town clerk for instructions to enable me to carry out these regulations, but he said I was to wait for further instructions.

15,234. (*Mr. Caird.*) Suppose you had power to enforce such regulations as might be adopted by the corporation, what course would you take to carry them out?—When I went on board the boats and found small soles I should report them to the mayor and the borough magistrates, and then the matter would remain in their hands.

15,235. You would not require regulations with regard to the size of the mesh and of the net used in fishing for soles?—I don't see how that is to be done. I have been engaged in sole-fishing myself, and I have tried it. I have a piece of sole net in my pocket now. This (*producing a net*) is what is called the large-sized mesh of a sole net.

15,236. What is the size of that net?—It is about an inch and a quarter.

15,237. What net is it?—A sole net.

15,238. Will not that catch soles too small to be marketable?—Yes.

15,239. It does catch small unmarketable soles?—Yes. The form of the net is such that it drives the small soles down into the cod end of the net.

15,240. Then if you permit the people to fish with that net, and you say that it will catch small unmarketable fish, how are you to prevent that by any regulations you can adopt?—The nets will not hurt the fish although they will catch the small ones; they only drive them down to the cod end of the net. The piece of the net I have shown you is what we call the "wing" of the net; the cod end is somewhat smaller.

15,241. Do you think that the small fish would be alive when they are brought up, and that they could be thrown overboard again without injuring them?—Yes.

15,242. Then you expect that they will be caught, and you think that there should be some regulation requiring the fishermen to return them to the sea when they have been caught?—Yes.

15,243. Do you expect that under any regulation you can adopt small fish might be caught by that description of net?—Yes.

15,244. A shrimp net will catch small soles?—Yes. This is the size of the shrimp net (*producing a net*).

15,245. That is smaller?—Yes.

15,246. Then unless an end is put to shrimping altogether it will be impossible to avoid catching small soles?—You can't avoid it unless you do away with shrimping altogether.

15,247. Has the take of shrimps increased or diminished within your experience?—They have decreased in regard to the quantity they can catch now.

15,248. Has not the season something to do with the quantity of shrimps taken? If there is a dry warm summer does it not affect the quantity of shrimps caught in the shoal waters?—If we have a dry warm summer it is favourable for shrimp-fishing.

BOSTON.

S. Hackford.

28 Nov. 1863.

15,249. Was last summer favourable ?—No.

15,250. But has it not been a warm summer ?—Sometimes we have had large takes, and sometimes for a week or two we got none. Generally we have been compelled to leave Boston Deeps and go to Lynn Deeps.

15,251. Is there anything in the mode of shrimping at present adopted which is injurious to the small fish ?—No ; I think the greatest destruction is produced by riddling them.

15,252. How is that done ? — When the shrimps are taken out of the sea they are put into a riddle, and the small shrimps in passing through the meshes are generally killed.

15,253. How can you avoid that ?—I don't see how it can be avoided.

15,254. You don't see any mode by which it can be avoided ?—No ; the riddles we use are iron riddles.

15,255. Is there any regulation you can suggest that would in your opinion prevent the decrease in the take of shrimps here ?—No.

15,256. You can suggest no remedy ?—No, I cannot see any. The greatest improvement would be, requiring the use of wide nets, which would let a great deal of the smallest-sized shrimps pass through. All sorts are taken now in the smaller nets.

15,257. Is the sprat fishery a very valuable one here ?—No, not at present.

15,258. Has it ever been in your experience ?—Yes, it was at one time.

15,259. Then has it fallen off of late years ?—Yes ; there are very few sprats here now.

15,260. What is the cause of that ?—I suppose the way in which the sprats have been taken all round the coast, and likewise in this bay.

15,261. Does the catch of sprats vary from season to season ?—It varies very considerably in quantity here from season to season.

15,262. And has that variation in quantity been always of late years tending towards a decrease ?—Yes ; the supply has been gradually decreasing for several years back.

15,263. Can you suggest any remedy for that ?—I hardly know what remedy I can suggest. With the sprat net it is all fish that comes to the net ; they all go in, and they are all killed.

15,264. Has the sprat fishery existed for some time in Boston Deeps ?—Yes, for many years.

15,265. And has it only lately begun to exhibit a decrease ?—For several years past it has been gradually on the decrease.

15,266. Has there been a greater quantity of boats and persons employed in the fishery of late years ?—There has been an increase of boats all over the island, and that increase has been going on every year.

15,267. But I am speaking now of your grounds here, not of the general fishing ?—They have increased here, but they do not come to fish in this locality.

15,268. Has not that increased number of boats taken as large a quantity of fish ?—No, they have fallen off each year.

15,269. With regard to the herring fishery, how in your recollection has that been ?—I have known it when the herrings have been almost inexhaustible. One season here the catches were immense, but now we have little or none.

15,270. In what season have you usually had herring-fishing here ? — In the winter season from December to February, and sometimes up to March.

15,271. When did you begin to observe a decrease in it ?—I have observed it now for several years.

15,272. What do you attribute it to ?—We think it owing to the millions of small herrings that are taken by the sprat nets.

15,273. Can you suggest any remedy for that ?—No.

15,274. Are there many oysters caught here, and are there many oyster beds ?—Yes, there are a good many oysters caught, but not so many now as there were some years since.

15,275. Are there any valuable oyster beds upon the banks which are under your charge ?—There are no oyster beds of any consequence in our locality.

15,276. Then where are they ?—In Wisbech Channel, at the bottom end of the Gat. At Lynn Well Light there is also a valuable fishery.

15,277. Has there ever been a valuable oyster fishery here ?—Yes, at the lower part of the Deeps, what is called the Dog Edge.

15,278. Is it no longer a good fishery ?—No, the oysters have all been dragged up.

15,279. Were they dragged up by the fishermen here or by strangers ?—Generally by our own men, but partly by strangers.

15,280. Is there no oyster fishery there at all now ?—There are very few oysters there now.

15,281. Is there no means of recruiting that oyster bed ?—Not unless there was a stop put to the taking of small oysters. They take them an inch or an inch and a half across ; they bring in thousands that size to Boston.

15,282. What do they do with them ?—They sell them at reduced prices.

15,283. Is there no interference with them ?—No.

15,284. Does the bed belong to anybody ?—No.

15,285. It is considered public property ?—Yes.

15,286. (*Professor Huxley.*) How do you take mussels here ?—We go ashore with drags and small nets ; we generally use a bow net.

15,287. A drag and a small net ?—Yes, a bow net.

15,288. How is a bow net made ?—With a bow, and there is a bag on it.

15,289. What is the bow made of ?—A piece of willow, or ash so that the fisherman can hold it in one hand and keep the net open.

15,290. Do they scrape the mussels off with anything ?—Yes.

15,291. Is it a thing like a rake ?—Yes.

15,292. So that the mussels are raked off the bed ?—Yes.

15,293. Are the teeth of the rake close set ?—They are about an inch apart.

15,294. Then I presume that they get small mussels because the small ones stick to the others ?—Yes, they all adhere together in a body.

15,295. When they get mussels for manure are they taken in the same way ?—Yes.

15,296. They are all taken in the same way ?—Yes.

15,297. Would it pay for manure if they had to sort the mussels out ?—No.

15,298. Then probably that is the reason why they do not do it ?—Yes.

15,299. But it does pay if you are to sell them for food ?—Yes.

15,300. If taking the mussels for manure is to pay at all they must have them unsorted ?—Yes, and the smaller brood are the best for manure. I say that from what I ascertained myself when I was at Thornham and saw them used for manure.

15,301. Is that because there is less shell and more flesh ?—I believe it is because the shell perishes sooner.

15,302. It is for the interest of the people who get them for manure to take them all unsorted ?—Yes.

15,303. You were speaking of a riddle just now for sorting mussels for eating purposes, what kind of a thing is that ?—It is a wire sieve.

15,304. What is the size of the mesh of it ?—I do not know.

15,305. At a rough guess ?—It is about an inch or an inch and a quarter square.

15,306. How do they work the riddle ?—One man holds the riddle in his hand and they put the mussels in by shovelsfull.

15,307. That can only roughly separate the small ones ?—The young ones are attached to the others by a very fine fibre. It is like a thread, and by heaving them in the riddle those fibres break and the small ones pass through.

15,308. Do not a good many of the big ones also get through ?—No, they wash them afterwards.

15,309. What is the riddle made of ?—Wire.

15,310. Then it is in fact an iron riddle ?—Yes.

OSTON.
Hackford.
Nov. 1863.

15,311. You said just now that you considered that a mussel became grown out in three years?—Yes.

15,312. Do you mean full grown?—Yes, it falls into decay.

15,313. It dies out?—Yes, of old age.

15,314. How long does it take to bring a mussel to perfection?—It is in perfection in the second year, and the third year it begins to decline.

15,315. You spoke of the mussel beds being exhausted in 1859. Do you mean that the old mussels were worked out?—Yes.

15,316. How many square acres were exhausted in that way?—I cannot say, there were some thousands of acres on the whole of the Toft sands, and the Gat and the Roger.

15,317. Are the mussels mostly on the sands?—No, they are on the mud at the top of the sands. When a mussel bed begins to form it becomes muddy.

15,318. Are there no stones for the mussels to hold to?—Not in our locality.

15,319. Are they quite loose?—They strike down with a kind of fibre into the mud.

15,320. And do they hold together by that fibre in the mud?—Yes.

15,321. I think you stated that your regulations were carried out for about a year?—Yes.

15,322 Not for longer than that?—No.

15,323. Was that one year sufficient to allow the mussels completely to recruit themselves?—Yes, they re-spawned.

15,324. (*Mr. Lefevre.*) I think you said that your regulations were only in force for six months?—Yes.

15,325. (*Professor Huxley.*) Do you mean six months or a year?—They were in force for six months, and then warrants were issued against the Lynn fishermen. At the end of that six months the year was over.

15,326. Then that made a year practically?—Yes.

15,327. So that the mussels were left undisturbed or else were properly surveyed for about 12 months?—Yes.

15,328. And that time was enough to enable the ground to be completely covered, so that since then about 300 tons a week have been taken away?—Yes, the mussels are now very thick all over the banks, the Roger, the Toft, the Gat, and the Blue Bank.

15,329. Do mussel beds cover the whole of these sands?—On the Toft they do.

15,330. (*Mr. Lefevre.*) Do they cover the Long Sand?—There are no mussels there; they are only on the Toft, and the Gat end, and the Blue Bank, and the Roger.

15,331. There are no mussels on the Frisk and the Flat?—No, those banks are all cockles.

15,332. (*Professor Huxley.*) One year's rest was sufficient to cover the whole of the banks you have mentioned with mussels?—Yes.

15,333. And that so thickly that you have been able to fish them ever since for three years?—Yes, the spawn covers the ground very thickly, but during the first season the mussels were so small that the people could not work them.

15,334. Then they got two years rest entirely?—Yes, they began to work them last season, and this year they have been in perfection.

15,335. Then practically they have had two years rest?—Yes.

15,336. You were speaking of cockles being on one of these sand banks, are they numerous there?—Yes, on the flats.

15,337. Are they worked for commercial purposes?—Many tons go away to the manufacturing districts.

15,338. Are they used for manure?—No.

15,339. I suppose the shells are too thick?—I never saw them used for manure.

15,340. I suppose the water in the Wash is thoroughly salt water?—Yes.

15,341. At that height up the Wash there is no mixture of fresh water?—No, the deep-water mussels are all in salt water. We sometimes get fresh-water mussels. We can always tell them; they are of a different colour, and larger.

15,342. You think that a certain flow of fresh-water is of use to the mussel?—Yes.

15,343. Does it clean them?—No, but it generally makes better and larger mussels. We have some in our river; they are twice the size of the mussels obtained on the banks.

15,344. But that is not the same mussel, is it?—It comes at the same time, and from the same spawn.

15,345. You do not mean to say that it is the sea mussel that lives in the river?—Yes, I think it is.

15,346. Surely the mussels do not spread up into fresh-water?—The spawn spreads right up.

15,347. But you do not find any considerable quantity of mussels there?—I have known them very plentiful occasionally. Some ten years ago the whole of the clays marked on the chart at the low part of the scarp were covered. I have not seen them so covered for the last ten years.

15,348. Is that a place that ordinarily has fresh-water on it?—Yes, it is where the inland waters come down.

15,349. But not throughout the year?—No.

15,350. Does it come down there now?—No.

15,351. (*Mr. Lefevre.*) Why does it not come down there?—I do not know.

15,352. Perhaps when the mussels were there it was when the fresh-water did not come down?—It came down then much more than it does now.

15,353–4. Has there been any particular diminution in the quantity of cockles of late years?—No.

15,355. You were speaking of herring being taken here in the winter, is that the same sized herring that you meet with elsewhere?—Yes, we get the same herring in the season, but the take has not been so good for the last few years.

15,356–7. Is that the same kind of fish that you get at Scarborough?—Yes, but not as big.

15,358–9. Have you any smaller kind of herring?—No, not that I am aware of.

15,360. What is the size of the mesh of the herring nets?—The mesh here is seven-eighths of an inch.

15,361. It is as small as that?—Yes.

15,362. So that it is probably a smaller fish?—Yes, it is a smaller fish. The major part of them that come here are shot fish.

15,363. What time of the year do they come?—The winter season, from December to February or March.

15,364. Do you think there are many young herrings taken with the sprats?—Yes, two thirds of the whole number, perhaps three-fourths, are young herrings.

15,365. Do you get any sprats in full condition here?—Sometimes we get a few.

15,366. At what time of the year?—In the winter season.

13,367. About November and December?—Yes.

15,368. Do you notice any difference in the shape of the herring caught here and elsewhere; do the fishermen generally observe a difference in the herring caught in the estuary here and those taken out of the sea?—No, I do not think so.

15,369. How long have you been acting as water bailiff here?—Since January 1859.

15,370. Are you the only bailiff employed by the corporation of Boston?—Yes.

15,371. Is there a large population of fishermen in Boston?—Yes, we have something like 45 boats, big and little.

15,372. What are the fishermen mostly employed in?—In soleing and in shrimping. Shrimping takes place at this season, and soleing in the summer.

15,373. What time of the year does the mussel season begin?—About September.

15,374. And how long does it last?—Until the warm season comes in. As long as they will keep to that they can be sent off and pay carriage to the manufacturing districts.

15,375. Are all the boats employed in collecting mussels?—Two-thirds of them at the present time are employed in collecting mussels.

15,376. Has the number of boats increased of late years?—Yes.

15,377. How do you sell the mussels?—At 9*d.* a bushel, I believe, or a shilling.

15,378. Has the price increased?—No, it has been reduced.

15,379. Is it reduced as compared with 10 years ago?—I would rather say three years ago.

15,380. Was it a bad season three years ago?—Yes.

15,381. What was the price of mussels then?—They were then 1*s.* 6*d.* per bushel.

15,382. Were you at Boston before you were water bailiff?—Yes.

15,383. Can you say what the price was 10 years ago as compared with what it is now?—They were worth more at that time than they are now, because there was not such competition. They are now getting five times the quantity they got then, and I suppose that arises from five times the number of men being employed in getting them.

15,384. By sending so many to market has the market itself been brought down?—Yes.

15,385. Then as compared with 10 years ago there are as many mussels on the beds now as there were then?—Yes, the beds are of about the same limits, except the Clays. The Clays are now extinct.

15,386. Are there as many mussels on the beds?—Yes.

15,387. What do they sell for as manure?—I have no idea.

15,388. I think you said that the herrings have been disappearing of late years?—They have been gradually decreasing for some time.

15,389. How far can you trace their disappearance back?—I can trace them back for many years. The time was when we could bring them into Boston in such large numbers that we could not sell them. They used to lie here in tons.

15,390. Was that an exceptional year, because I see from the history of Boston that the herrings have been disappearing since 1812?—In my day we could get herrings to any amount.

15,391. Was that for more than one good year together?—Yes, for several years.

15,392. Since 1812?—Yes, 16 or 17 years back. Since I have been a pilot.

15,393. I want clearly to understand whether that occurred only in one year or for several consecutive years?—It occurred for several years.

15,394. Has the sprat-fishing been going on all that time?—Yes.

15,395. Have young herrings been caught during that time in the stow nets?—Yes, three-fourths of the sprats are young herrings.

15,396. Then catching young herrings did not affect the catch of herrings at their season?—No.

15,397. I thought you said that the sprat-fishing has fallen off?—The herring-fishing has fallen off, and the sprats have fallen off too, but there was not so much spratting in the early part of my time as there has been since.

15,398. How long is it since the sprat-fishing began to fall off?—We have got none during four or five years in any quantity.

15,399. Was the supply pretty regular before then?—There was not the same quantity caught at that time. I do not know that we had more than one or two boats out of this town at that time.

15,400. What do the men fish for in the summer time?—Generally for soles and shrimps, and many of the bigger boats are employed in taking bait down to the north to lay it on the beds there.

15,401. For the winter fishery?—Yes.

15,402. They do employ themselves about the mussel beds in the summer?—Yes

15,403. Do they keep the mussels alive till they get on the coast off Scarborough?—Yes, they will keep for about five days even in hot weather.

15,404. Not in very hot weather?—Perhaps not quite so long, but they risk that.

15,405. Do you think that one water bailiff is enough to look after the fishing?—I believe that one is quite enough if we had proper protection and were enabled to carry out the letter of the law.

15,406. The magistrates have refused to grant summonses?—Yes, I applied for several, and they expressed a doubt as to how they ought to act. I was ordered by the town clerk to wait for further instructions.

15,407. Does the jurisdiction of the Boston corporation extend over one-half of the Wash?—It extends to the Outer Knock, and the parallel line drawn there forms the boundary between Lynn and Boston.

15,408. Is that about half for each?—Yes.

15,409. Do you think that one other man looking after the Wash on the part of the corporation of Lynn would be sufficient?—Yes.

15,410. (*Mr. Caird.*) Is there a good smelt-fishing here?—No.

15,411. Are smelts not caught here?—They have been caught here in abundance.

15,412. Then are they falling off?—Yes.

15,413. Can you trace the gradual decrease of the smelts?—Yes. Where there used to be a smelt fishery the bed of the Wash has generally been filled up by the recent improvements.

15,414. Then do the fish no longer come here?—Very few; they are getting to be scarce fishing.

15,415. You do not attribute that to any mode of fishing that has been adopted, but to some improvements in the reclamation of the land?—Yes; it has arisen entirely from the improvements which have been made, and from the way in which the Wash has been filled up.

15,416. No destructive mode of fishing has injured the smelts?—No.

15,417. (*Mr. Lefevre.*) Were many complaints made by the men when you tried to enforce the regulation about riddling the mussels on the spot from which they were taken?—Yes. They could not riddle them on the beds, because the mussels were imbedded in mud, and it was therefore impossible for them to riddle them. They must bring them to the water somewhere, and there was no water nearer than half-a-mile.

15,418. If they had been compelled to riddle them in the boats would that have been sufficient?—I think so, provided they took the refuse back again.

15,419. Did you permit that?—Yes, that was carried out to a certain extent.

15,420. Was there any complaint on the part of the men as to interference in that respect?—Yes, ther were still complaints, because they found it impossible to do as much work.

15,421. How was that?—Suppose a man brings a cargo of mussels up, he chucks them ashore and leaves another man to riddle them. If he riddled them himself in the boat he must stop his work until he has riddled them.

15,422. What do they pay the men for riddling them?—I do not know what the rate is, but it so much per bag.

15,423. And it can be done cheaper ashore than in the boat?—Yes, twice the amount of work can be done in that way. The man leaves one lot of mussels ashore and goes for another cargo while they are being riddled. If they were to be riddled in the boat they would have to be cleaned alongside the wharf.

15,424. (*Professor Huxley.*) You were talking just now about mussels in fresh-water. A gentleman in the room has been good enough to put one of these mussels into my hand. Do you mean that these mussels are constantly in fresh-water?—No.

15,425. This, for example, is covered with acorn shells?—It has been taken off our pier. In the summer season when they stop the sluice there is nothing in the river but salt water. At times we have had no fresh water down the Haven for eight months.

15,426. Every tide you have salt water?—Yes.

BOSTON.

S. Hackford.

28 Nov. 1863.

15,427. (*Mr. Lefevre.*) Besides the mussels which you say are taken away by the men who come from the north for bait, are any sold at Boston for bait?—Yes; at present there are a great many going by rail down to the northern parts.

15,428. Are those brought by the Boston fishermen sold there?—Yes, they are put in the railroad trucks and sent away.

15,429. Are they included in the 100 tons which you say are sent into the country?—I believe I speak within limits when I say that there are more than 100 tons.

15,430. How much is used for food and how much is sent away?—I do not know; Mr. Hayes will be able, I think, to give you the statistics. He is the contractor for those that go by the railroad.

The witness withdrew.

D. Hayes.

DANIEL HAYES called and examined.

15,431. (*Mr. Caird.*) You are a smack owner and fish salesman I understand?—Yes.

15,432. Have you been long resident in Boston?—Yes.

15,433. How long have you been engaged in that business?—For 40 years.

15,434. Can you tell us with regard to the supply of the various kinds of fish whether the quantity now received here is increasing or diminishing?—It is diminishing very much.

15,435. When did you begin to notice the diminution in a marked manner?—I have noticed it for the last 20 years.

15,436. Has it been a gradual diminution for 20 years past?—Yes.

15,437. Has any particular kind of fish diminished more than another?—I have noticed a diminution, particularly in herrings.

15,438. Of all other kinds of fish is there still a fair supply?—There is not as large a supply as before, but the falling-off in the quantity of herrings has been particularly marked.

15,439. The falling off in the quantity of herrings has been more marked than in any other kind of fish?—Yes, and I attribute it to the use of the stow nets.

15,440. What kinds of fish are brought to this market?—Soles and smelts; that is all I know of particularly.

15,441. Has the supply of soles much decreased?—Greatly.

15,442. When did that decrease begin to show itself most?—The quantity has been decreasing during the last 12 or 14 years.

15,443. Are there as many boats employed in the fishing here now as there were 14 years ago?—I should say there are rather more.

15,444. Is the total quantity caught by that increased number of boats not equal to what it was 14 years ago?—No.

15,445. You speak positively upon that point from facts within your own knowledge?—Yes.

15,446. Can you give us those facts?—Yes.

15,447. What quantity was caught in the course of a week, or a month, or a season, 14 years ago?—What kind of fish are you asking about?

15,448. I am speaking of all kinds of fish?—I have seen 300,000 or 400,000 herrings brought here in a morning; and now 300 or 400 are all that we can raise.

15,449. Was that in December or January?—Yes, in the winter season.

15,450. How long is it since you had a take of 300,000 or 400,000 in one morning?—14 or 15 years ago.

15,451. Have you never within that time had a good fishing, as compared with previous bad fishings?—No; the quantity caught has come down from 300,000 or 400,000 to 300 or 400.

15,452. But what I want to know is this, do not the seasons vary; have you not had one good season, and then one not so good?—No.

15,453. Has there been a constant decline?—Yes.

15,454. Has the supply now diminished to a serious extent?—We don't get more than 300 or 400 at all in a day.

15,455. At no time?—Yes, at no time.

15,456. Has the smelt-fishing decreased in the same proportion?—I think not so much.

15,457. Is there still a considerable supply of smelts here?—I think there is a fair supply caught here now. There used to be a great quantity, but since we had the new cut made there has been a great decrease. There used to be many thousands before the cut was made. The making of that cut cleared a large portion of them away.

15,458. With regard to mussels, has the quantity of mussels decreased or increased within your knowledge?—They have increased quite lately.

15,459. They have increased since 1859?—Yes.

15,460. Can you tell us what quantity is brought here every day on the average?—I can't tell you that. I have sent 100 tons away in a week to Eyemouth, in Scotland.

15,461. Are you doing that now?—No, I am not sending away now.

15,462. Is not this the season at which they are usually sent?—Yes; but the smacks take them down now if there is a fair wind.

15,463. If there is a contrary wind are they sent by land?—Yes, but there have been favourable winds lately.

15,464. Do you sell a large quantity for food?—No, I don't.

15,465. Is there a large quantity sold for food?—Yes.

15,466. Where do they go?—To Manchester, Sheffield, and other places.

15,467. What quantity is sold for food?—I cannot tell.

15,468. Has it been an increasing quantity for the last three years?—Yes, it has very much increased.

15,469. Then the quantity of mussels for all purposes has much increased?—Yes.

15,470. Do you apprehend that there will soon be a decrease?—Yes, if they are allowed to be taken for manure.

15,471. Have the mussel beds shown any signs recently of falling off in their yield?—I don't think they have.

15,472. Then why do you imagine that they will do so?—I think they will if truck-loads are allowed to be sent away with all the brood in them. They don't go for the small ones purposely, but for any they can come at, and they take away the small with the large.

15,473. To what do you attribute the falling off in the take of soles?—I think it is owing to the fishermen catching small ones. Their wives meet them when they come in, and take them round by basketfuls for sale not more than three or four inches long. They have done that for years. The proper size at which they should be taken is about 18 inches, but they take them less than that.

15,474. Do they sell them at a reduced price?—No doubt they do.

15,475. Is there a large quantity sold in that way?—You are speaking now of soles?

15,476. Yes. Is a large proportion of the whole catch sold in that way?—Yes, a great quantity.

15,477. Half of the whole quantity?—I should say more than one half.

15,478. Has that continued for many years?—Yes.

15,479. The humbler classes have had in that way the advantage of getting a cheaper kind of fish than they would otherwise have?—Yes. I have known 20 or 30 pairs of soles sold for 6*d.*

15,480. Can you tell us within your recollection how far the quantity of soles brought to the market in a day, on the average—I mean marketable soles

BOSTON.

D. Hayes.

28 Nov. 1863.

such as you sell—has decreased?—They scarcely get any now; the men do not care about going after them.

15,481. Are small soles caught and sold?—Yes.

15,482. Are they caught and sold in large quantities?—Yes.

15,483. With regard to the sprat fishery, has it decreased much within your recollection?—There has been nothing to signify done in it for the last two or three years. They have been partly young herrings and sprats that have been caught.

15,484. Are they sold for food?—Yes; they are sold in the manufacturing towns. A great quantity of them are sold for manure.

15,485. Within recent years have they been sold here for manure?—When the market will not take them they generally sell them for manure; but the market will take a great quantity just now, as we have a very good delivery for them.

15,486. Do you sell oysters here?—Yes.

15,487. Is the take of oysters increasing or diminishing?—It is much about the same. I think it would increase very much if they made the rings of the bottom bag with which they catch them less.

15,488. How long does your experience extend with regard to the oyster take here?—We have always had them in Lynn Well and Boston Deeps, but they get them very small compared with what they did formerly.

15,489. Has the quantity very much decreased altogether?—Yes.

15,490. What quantity will be taken in a season, say in bushels or tons?—We buy them by the thousand here, and not by the bushel, as in other places.

15,491. Then what quantity will be taken by the thousand?—I cannot say.

15,492. (*Professor Huxley.*) Have you caught herrings here yourself?—No.

15,493. You have not been a herring-catcher?—No.

15,494. Do you buy herrings?—Yes.

15,495. At what time of the year do you find that the herrings are most abundant?—They go now about this time and get them.

15,496. At the beginning of December?—Yes, they have caught a few to-day.

15,497. Are there any in the town now?—There were in the morning; a man asked me to buy some.

15,498. In what condition are they now?—In very fine condition.

15,499. Are they fat fish?—Yes.

15,500. Full fish?—Yes, fat fish and full fish.

15,501. Are there any full fish now?—Yes, they are all full fish. They were all full fish that I saw to-day.

15,502. Do you think those herrings are bred here in the estuary, or do they come from some other place?—I think they never leave us.

15,503. Were the herrings you saw here this morning caught here?—They were quite fresh and good. I am sure they were caught here; I know them very well when I see them.

15,504. Is it a different description of herring from the northern herring?—Yes, the northern herring is as big again.

15,505. Do you think we can get some to-day?—I don't think you can. One man had 100 that was caught in the main. I believe he set some stakes, and the tide drove them through.

15,506. Were they quite full?—Yes.

15,507. Is that generally the case?—Mostly.

15,508. How long do they remain full?—I never saw any empty, not lately. I have never seen any shot herrings.

15,509. During how many months do you get them?—About three or four months.

15,510. Are they always full herrings?—They have always been full that I have seen. I have seen a vast quantity of shot herrings from the north, but ours are generally full.

15,511. Do they not become shot at some time or other?—I have never seen any.

15,512. What is the average length of the herring here?—It is a small little herring.

15,513. Is it not more than eight or nine inches long?—No.

15,514. Then it is a quite different looking herring from the northern herring?—Yes, different looking altogether.

15,515. Are the mussels that are caught for bait here riddled?—No, they are all taken with the brood, with the moss on. They would drive off if they did not keep them together.

15,516. In speaking of the "moss" you mean the silky kind of stuff that holds them together?—Yes.

15,517. Then the carrying away of mussels for bait is as destructive as taking them for manure?—I daresay it is.

15,518. Do you not take into account that the carrying away of mussels for bait is one of the causes that has led to the destruction of the supply?—No doubt it is one of the causes.

15,519. Would it be of any advantage if the mussels for bait were riddled?—They would not have them if they were riddled. They could not lay them down on their mussel parks; they would all swim away.

15,520. Then if mussels are to be sold for bait they must be taken unriddled?—Yes.

15,521. If there were any regulations that would put an end to the taking away of mussels unriddled would that put an end to the supply for bait?—Yes.

15,522. So that any regulation which contemplated the suppression of the taking of mussels for manure would prevent the taking of them for bait?—Yes.

15,523. Is this a great market for mussels for bait?—Yes, we send away many to Eyemouth and other parts of Scotland.

15,524. Can you think of any regulation that would prevent the destruction of the fishing for mussels, and allow them to be taken for bait?—I am not aware of any.

15,525. How are soles caught here?—The largest part of them are caught now in the shrimp nets. They used to be caught in sole nets.

15,526. What kind of a thing is a sole net?—It is about 12 yards long.

15,527. Is it a bag net?—It goes with trawl leads.

15,528. Is it made like a trawl?—Yes.

15,529. Is it a kind of light trawl?—Yes.

15,530. What is the length of the beam?—That depends upon the size of the boat. It is generally about 14 feet long.

15,531. Is it used in an open boat?—Yes, the shrimp boats catch soles as well as the trawl boats.

15,532. The ordinary way of catching them is by a regular trawl net, only that the trawl has a small beam?—Yes.

15,533. Did you ever hear it stated that these nets used in the Wash caught spawn in them?—I never heard of such a thing.

15,534. Do you think that the practice of trawling is very destructive to the young brood?—No, but I think the stow nets kill everything.

15,535. Does the herring you speak of spawn in the Wash?—I don't think that it ever leaves us.

15,536. At what time of the year do they spawn?—About May, I think.

15,537. As late as May?—Yes.

15,538. Are the fish caught in May?—No, not in May; generally in January.

15,539. Is that because the fishermen don't set the nets for them?—I imagine that is so.

15,540. What makes you think they spawn in May?—Because I have seen them very thin then.

15,541. But you have never seen herring spawn taken in any of the sole trawls?—No.

15,542. (*Mr. Lefevre.*) Do you recollect the time when the regulations were enforced with regard to riddling on the banks?—Yes.

15,543. Did the supply of mussels for bait fall off?—

BOSTON.

D. Hayes.

Nov. 1863.

There was not any supply for bait then. It is only of late years that we have got a supply for bait.

15,544. How long ago?—I wrote to Mr. Seymour Clarke, the manager of the Great Northern Railway, for a rate, and they agreed to carry them for 1*l.* a ton. It is only of late years that they have been sold for bait.

15,545. But have any boats come down from the north and loaded themselves with mussels?—Yes, scores of mussels have gone away, but none by rail until lately.

15,546. Were the regulations enforced upon them as well as upon the inhabitants of Boston?—Yes.

15,547. Did you find that the smacks did not come in consequence, and that they did not take mussels?—We were unable to stop them. The authorities here tried to stop them, but they did not succeed.

15,548. What fish do you buy mostly here?—I send for fish from Grimsby. I get the best part of it from that place.

15,549. Then you don't do any great business with the fishermen who come into Boston?—No. I have a few smacks and get a few mussels and soles.

15,550. What sort of vessels are yours?—Trawlers.

15,551. Where do they fish?—Down in the Deeps.

15,552. Do they catch soles there?—Yes; but I have never seen one this last season. It was of no use.

15,553. (*Mr. Caird.*) Do you think that any improvement would be likely to be made upon the yield of mussels on these beds by adopting a regulation requiring the beds to be fished in regular succession, so that some of them would not be disturbed at all for a year?—I think if the mussels were riddled on the beds instead of being brought to Boston they would increase without any other regulation.

15,554. But you said just now that if they were riddled at all they would be useless for bait?—Yes.

15,555. They would not be purchased for bait in that case?—No; not if they were washed and cleaned.

15,556. (*Mr. Lefevre.*) Would that not be a great loss to the fishermen and to the town?—Yes.

15,557. Is there anything paid to the town for the right of taking mussels?—No.

15,558. Do strangers pay anything for the right of taking mussels?—No.

15,559. Are they considered public property?—Yes, anybody can take them who likes.

15,560. Is there any mode by which you conceive the quantity of mussels could be increased for the benefit of the public?—Not that I know of. I know there are thousands of acres at this time.

15,561. They are very plentiful just now?—Yes, very plentiful.

15,562. But you are apprehensive that that abundance will soon cease?—Yes, if they take them as they are taking them now.

15,563. According to the evidence we have before us there appears to be a smaller quantity taken for manure than for anything else?—A great many are taken about Thornham and Lynn.

15,564. I think that the water bailiff stated that about one-third are taken for bait, a third for food, and a third for manure?—About 100 tons are taken for food.

15,565. Sold for food?—Yes.

15,566. And about as much for manure?—I don't know; they are not so particular what they take for manure.

15,567. Do they take them any size for bait?—No; they must be big mussels to be of any use for bait.

15,568. But do they not take small ones with them?—Yes, they take small ones with them because they dare not part them.

15,569. Then, practically, both kinds are taken for the same purpose?—Yes; but when they come here for bait they are riddled, and the small ones go through the riddle.

15,570. But are they put back again upon the banks?—No.

15,571. There is not a system adopted by which they are put back?—No.

15,572. Then, practically, they are destroyed?—Yes.

The witness withdrew.

W. Simonds.

WILLIAM SIMONDS called and examined.

15,573. (*Mr. Lefevre.*) We were told by the water bailiff that regulations were laid down by the corporation of Boston for the management of the fisheries, but that they were not afterwards enforced in consequence of the magistrates refusing to issue summonses?—The point in dispute was that the place for which the summonses were applied for was deemed to be out of our jurisdiction. They riddled the mussels on the Great Northern stage, which is out of the borough, and the magistrates here thought they had no power. It has been a matter of dispute for some time. The fishermen bring them up in boatloads, and they riddle them on that stage so that they can be put on the Great Northern Railway at once.

15,574. Did the magistrates refuse to issue summonses on the ground that the mussels were riddled beyond their jurisdiction?—Yes, that was the reason.

15,575. Have you made no attempt to get summonses issued on the part of the county magistrates?—I am so very young in office, having only been mayor for a fortnight, that I can give you no information.

15,576. But how long have you been a member of the corporation?—I have been a member of the corporation for several years.

15,577. Then you are acquainted with the proceedings of the corporation?—Yes. I believe there has been an attempt made to secure the assistance of the county magistrates, and I think the point at issue is whether the fact that these mussels are riddled in our river does not give us the control as river commissioners, but the point has not been yet settled.

15,578. I think it is three years since an attempt was made to enforce these regulations?—We have made various attempts to enforce them, but I don't suppose we have succeeded practically in doing any good.

15,579. You have taken no steps practically during that time to enforce the regulations that you laid down?—We have only taken steps by appointing a water bailiff, and it appears that all the steps we have taken have been abortive.

15,580. You have taken no steps to give strength to the authority of the water bailiff?—We have done nothing more than make the appointment.

15,581. (*Professor Huxley.*) I should like to know what it is the corporation of Boston complain of with regard to the fisheries. We have visited the town at the invitation of the corporation in order to ascertain what complaint you have to make, but we have not as yet definitely arrived at any clear grievance. What is the complaint on the part of the fishermen, or of those who are entrusted in the fisheries?—Of myself I know nothing about the matter.

The witness withdrew.

T. Wise.

THOMAS WISE called and examined.

15,582. (*Professor Huxley.*) I wish, Mr. Wise, to know what are the particular grievances that are complained of by the fishermenor other persons interested in the fisheries here?—They complain that the fish are taken with nets of an mproper sized mesh, and that mussels are being taken without any regard to the size at which they ought to be taken. The young brood is removed bodily, and in course of time we shall lose our fishing ground. We have found that to be the case to a certain extent.

BOSTON.

T. Wise.

28 Nov. 1863.

15,583. Do you consider that the mode of fishing practised here is wasteful?—Yes. When we appointed a water bailiff in 1859 our mussel beds were very nearly exhausted. We took steps to meet the corporation of Lynn to endeavour to bring about joint measures in order to secure us from losing the mussels altogether. We were of opinion that these mussel beds were very valuable to our fishermen, and that the destruction that was going on ought to be prevented.

15,584. Then you complain that there are wasteful and destructive modes of fishing practised here?—Yes.

15,585. Will you be good enough to enumerate them, in the first place as regards ordinary fish; let us take soles to begin with?—I consider that they are destroyed by being taken in shrimp nets, which are of too small a mesh. Instead of the fish being taken when they are in a fit condition for the market they are frequently so small that they are thrown overboard into the sea.

15,586. You consider that a wasteful mode of fishing?—Yes; these small fish are smuggled into the town and sold whenever it is possible.

15,587. Why are they smuggled?—To prevent the water bailiff detecting that they are of too small a size. They skin them.

15,588. How is that?—The head is taken off; they should be so long from head to tail. They take off the head so that we can't measure them; that has hitherto bothered him.

15,589. Has the offender been allowed to escape on doing that?—The bailiff could not do anything in the matter.

15,590. But he could surely state what the maximum length of the fish was although the nose was cut off?—He could hardly say that originally it had not been of the proper size.

15,591. I think your bailiff must have been easily beaten?—The falling off in the fishery here has been sensibly felt by the people engaged in the fishing trade. I recollect when the boats got 30*l.*, 40*l.*, or 50*l.* worth of fish in one haul in the herring-fishing.

15,592. To what do you ascribe the falling off in the herring-fishing?—To the sprat-fishing.

15,593. Do you mean stow-boat fishing?—Yes. If you examine the small fish sold as sprats you will find that eight out of ten of them are young herrings.

15,594. Has that sprat-fishing gone on for many years?—For about 12 or 14 years.

15,595. Has there been a gradual diminution in the number of herrings caught during that time?—Yes, there has been a gradual and very perceptible diminution.

15,596. With regard to mussels, from what cause do you think the falling off in the yield has taken place?—I think the cause has been the taking of mussels without regard to their age,—the taking of the young brood.

15,597. What regulations do you think would be effective in preventing their further destruction?—I am not aware, unless they were laid down on separate beds and taken up in rotation.

15,598. Do you think it would be a sufficient protection if a third or one-half of the surface of the mussel-beds was protected for a year or two, not allowed to be fished, and a regular rotation enforced?—I think the taking of them in rotation would be the best system.

15,599. Do you think that could be carried pretty easily into practice?—Yes.

15,600. It would not be at all difficult to say what beds ought not to be fished?—No, the mussels here are quite uncovered. This has been a matter which has engaged the attention of the corporation for a great number of years.

15,601. (*Mr. Lefevre.*) Has the sprat-fishing fallen off as well as the herring-fishing?—The quantity of sprats taken now is not nearly as large as it has been.

15,602. Do you know whether the proportion of young herrings is about the same?—About the same, I think.

15,603. They still continue to catch a considerable number of young herrings?—Yes; I have seen at one period 20 boatloads of sprats taken in a day, and now you don't see a boatload once a fortnight.

15,604. (*Mr. Caird.*) Has not the sprat-fishing been practised here longer than 12 or 14 years?—No.

15,605. There was no sprat-fishing 20, 30, or 40 years ago?—No, I don't recollect that there was. At one time, 30 or 35 years ago I think, sprats were caught above the bridge towards the sluice. They used to be brought up by the tide, and the fishermen put nets across the river and caught them in the receding tide.

The witness withdrew.

J. Cousens.

JOHN COUSENS called and examined.

15,606. (*Mr. Caird.*) Are you a fisherman here?—Yes.

15,607. Have you been long engaged as a fisherman?—Yes.

15,608. For how many years?—Nearly 40; 37 I think.

15,609. What kind of fish do you catch here?—When I first started fishing I caught smelts, sprats, buts, plaice, and so on in general, but afterwards I managed to get a larger boat, and I went after mussels, sprats, and herrings.

15,610. What do you do now?—I am engaged in musseling generally.

15,611. Do you get mussels all the year round?—No.

15,612. What else do you fish for?—I go shrimping and prawning in the summer season.

15,613. What are the different seasons in which you catch the different fish?—The mussels we get in this season.

15,614. What is the season?—From September until the following May, or a little after.

15,615. And then what do you begin to fish in May?—I then fish for shrimps, prawns, soles, and so on.

15,616. How long does that season last?—In general during the whole of September and October.

15,617. From October what do you fish then?—It depends on the season. If the season comes on severe we begin musseling again, or oystering.

15,618. What time of the year do you fish for smelts?—Smelts have two seasons. The first, the spring season, commences at the beginning of March and lasts until the 1st of May. Then it goes off from May until September.

15,619. Is there no fishing for smelts during the warm months?—No.

15,620. When do you begin again?—In September.

15,621. And then do you fish on until March?—Yes.

15,622. Has the take of smelts increased or diminished within your recollection?—It has diminished somewhat in consequence of the works which have been in progress in our rivers.

15,623. Have those works diminished the fishing?—Yes. They have destroyed the food for which the smelts came into the haven.

15,624. Is there not as large a quantity of smelts taken now as there was 20 years ago?—No.

15,625. And you attribute that to some improvements which have been made in the rivers, inland?—Yes; the consequence of the improvements has been that there is no food within the limits of our waters upon which the smelts can feed.

15,626. And formerly there was food for them?—Yes.

15,627. With regard to shrimps, has the quantity

BOSTON.
J. Cousens.
3 Nov. 1863.

caught here increased or diminished?—It has decidedly diminished.

15,628. What is the cause of that?—I think it is partly owing to the reclamation of the land. The land has been much taken in of late years.

15,629. During your experience, which extends over nearly 40 years, has there been much of the land over which you used to fish reclaimed from the sea?—Yes.

15,630. And was the position now occupied by that reclaimed land formerly a good position for catching shrimps?—No, that is not it exactly. Formerly at times the shrimps used to come up to those places, and then go off again to deeper places; now they come up to the small brush-work they have put in the river, and they do not in general go down again. I think it is very likely that the fresh water and the weed coming down the haven kill the shrimps, and prevent them from getting down into our Deeps. I think that has been the principal cause of the diminution in the number of shrimps here.

15,631. Are there more boats engaged in fishing for shrimps than there used to be?—Yes; I think there are.

15,632. Have they increased much?—Yes.

15,633. In recent years?—Yes.

15,634. Are there twice as many boats as there were formerly?—Yes, I think so.

15,635. Do all of them make a good living?—They do not all of them make a good living. Some will make very little, while others will no doubt make a very nice living.

15,636. On the whole is the number of shrimps now taken by double the number of boats as many as was taken 10 years ago?—No, I think not.

15,637. Has that been partly caused by over-fishing the shrimps?—No, because the Deeps, both Lynn Deeps and Boston Deeps, and the Gat, are quite large enough for far more boats than have been engaged in the fishing. There has been no injury done in that way, nor has there been any interruption to the supply.

15,638. What is the cause of the interruption in the fishing?—I believe the principal cause is what I have already stated, namely, the inclosure of the banks. The result of that has been to destroy the food, and now there is no food for the fish to come after in our rivers.

15,639. I think you said that the supply of soles has also decreased?—Not at all times.

15,640. Are there as many soles caught now as were caught formerly?—No; but it depends in a great measure on the food to be found in Boston Deeps.

15,641. Are there as many people employed in fishing for soles as there used to be?—No.

15,642. Is that because it has been found not to be a paying business?—Yes.

15,643. What is the cause of that?—I believe the cause has been the variation in the seasons of the year. We have had north-east, southerly, and other unfavourable winds during the last two years. They have been very prevalent and have injured the fishing.

15,644. What effect has a southerly wind on you?—A southerly wind drives down the Lynn and Boston Deeps, and along the coast, and the fish will not face it. It is the same with the sprats and herrings.

15,645. Then do you attribute the decrease in the number of soles caught here to the prevalence of winds blowing down the Deeps?—Yes, partly.

15,646. Has there been a greater prevalence of late years of winds from that quarter than formerly?—At times there has. Mild weather would make a great deal of difference.

15,647. (*Mr. Lefevre.*) Has the wind lately been generally southerly?—Yes; for the last 18 months.

15,648. (*Mr. Caird.*) Southerly and north-easterly?—Yes, southerly and north-easterly.

15,649. (*Mr. Lefevre.*) Do you mean that the wind has been blowing from the land towards the sea?—Yes.

15,650. (*Mr. Caird.*) Has the sprat-fishing increased or diminished?—It has diminished.

15,651. Are there as many persons employed in the sprat-fishing as there used to be?—Yes.

15,652. Do they not take as many fish?—No.

15,653. How long is it since sprat-fishing began here?—I cannot say.

15,654. Has it been as long as you can recollect?—There was sprat-fishing here before I can recollect.

15,655. Did they catch them by using stow-boats?—Yes; we all use stow-boats.

15,655*a*. Have stow-boats been used as long as you can recollect?—Yes.

15,656. That has always been the system practised here in fishing for sprats?—Yes.

15,657. Has the number of stow-boats increased at Boston?—Yes.

15,658. Has it materially increased?—Yes.

15,659. Can you go back for 20 years and compare the take of sprats on the average 20 years ago with what it was five years ago, when I believe you had a very good take?—There was a very fair take five years ago.

15,660. How was it 20 years ago?—There were very large takes then.

15,661. Had you a larger take 20 years ago than you had five years ago?—Yes, I think we had.

15,662. Has there been no increase during the last 20 years?—No, I believe not. Between 20 and five years ago I do not think we had any large season, but, on the contrary, we had a decrease betwixt the two periods.

15,663. Since then have you had large takes in recent years?—Two years ago we had a nice shoal of sprats, and then they went away from us, and we had no more.

15,664. What was the cause of that?—A large species of seaweed came up in Boston Deeps and Lynn Deeps and all over the Lincolnshire and Norfolk coasts. Southerly winds then set in, and all the half-grown herrings and sprats went away together.

15,665. Did they go away along with the seaweed you have mentioned?—Yes; they deliberately went away from us, and we were greatly distressed in consequence.

15,666. Have sprats been caught and sold for manure for a long period?—Yes.

15,667. Are they sold for manure as a matter of course, or when they cannot be sold for food?—When we have no sale for them for food we sell them for manure. Suppose a boat comes up with 10 or 20 tons of sprats, say that it should happen to have 20 tons; in that case we should take four or five tons off the top and send them to market and get our money for them as food. The rest would not be quite good enough for the market, and would be sold for manure.

15,668. Could you do nothing else with it?—No.

15,669. I presume that wherever you can sell it for food, you do so because you get a better price for it?—Yes.

15,670. What number of boats are engaged in the sprat-fishing in the season?—I can hardly tell. I have one only.

15,670*a*. With your one boat in a good season, how many tons of sprats do you catch?—It depends on the weather.

15,670*b*. But take a good season; supposing the weather is favourable?—We depend on the tides.

15,671. But suppose the tides are favourable. They come and go every day, do they not?—Decidedly not. The tides only last us perhaps a fortnight. There might be a gale of wind during those tides, and we might be only a day or two out at the fishing. Perhaps a boat might get five or 10 tons; but that would be according to the size of the boat.

15,672. Will a boat sometimes take as much as 10 tons?—Yes; and sometimes only five tons or three tons.

15,673. What is the largest take you ever saw at one time?—12 tons.

15,674. Will you get that in succession in a course

of days ?—No ; the boat would have to come away from the ground to deliver them either for sale or for manure, according to the weather.

15,675. If anybody told you that by over-fishing sprats you have injured your prospects for the future fishing of sprats, would you believe that that is true ?—I am telling you the truth.

15,676. Do you think that by over-fishing the sprats in the Wash, you may take too many out one year and too few the next ?—Decidedly not. We had none last year, and the season before last we had very few. Some boats will get perhaps three or four chaldron, while others will get only three or four bushels. We none of us got any last year, but perhaps this next season may be more profitable.

15,676*a*. Although you caught none last year, you think it possible that you may have a good season this year ?—Yes.

15,677. And if you catch a good number this year, you may catch an equally good number next year ?—Yes. There is a large quantity of codfish caught now in Boston Deeps. The Grimsby, Cleethorpes, and Hull smacks are getting codfish out of Boston Deeps.

15,677*a*. Are they trawling ?—No, long-lining ; and we think we shall have a good sprat and herring season.

15,678. Does a good herring season follow a good cod season ?—Yes.

15,679. Then you look for a good season because a good many cod have been caught ?—Yes, at the Outer Knock buoy.

15,680. Do you think there may be as good a season as there has been formerly ?—I have no reason to think to the contrary. I am sure I hope to see it, if only for the sake of those poor fellows who catch herrings on the mains at Bennington, Wrangle, and so on.

15,680*a*. (*Mr. Lefevre.*) Where is Wrangle ?—On the Lincolnshire coast, before you get down to Wainfleet.

15,681. Along the Friskney Flats ?—Yes.

15,682. (*Mr. Caird.*) Has the herring-fishing fallen off ?—Yes, during the last two years.

15,683. Then do you expect that you may have as good a season this year as you used to have in former times ?—I think it is very possible. Our Deeps are equally the same that they were formerly.

15,684. Have you not destroyed the brood ?—No, we don't take the brood.

15,685. Do you take no young herrings with the sprats ?—Only rarely. If they come in the sprat net of course we cannot help taking them, but we do not destroy any more than we can help.

15,686. Can you speak of the take of herrings as far back as 20 years ago ?—Yes.

15,687. Had you 20 years ago sometimes a very good season, and sometimes a middling season ?—20 years ago we had very middling seasons.

15,688. Was the fishing as bad as it is now ?—It was very inferior. 20 years ago it was very bad.

15,689. Did it then begin to increase ?—A little trifle. That was owing to the herrings coming from the Norfolk coast.

15,690. How did it go on ? Give us the history of the herring-fishing for the last 20 years ?—The herrings in general used to come from the north coast across the Dowsings into our Deeps. That was the sort of fish we used to catch. It was not the North Sea fish, however. The North Sea fish never enter our Deeps.

15,690*a*. Are your fish smaller fish than those caught off the Norfolk coast ?—Yes.

15,691. Smaller than those caught off Yarmouth ?—Yes.

15,692. Are they the same sort of herring as the Yarmouth herring ?—No, decidedly not.

15,693. You say they come from the outside ?—Yes, and we have also fish that have been bred in our Deeps. They grow to what we call "half-grown stuff," half-grown herring, and then in the sprat season we catch them and get a good price for them in the manufacturing districts, equally as good as for herrings of a proper size.

15,694. Is that because they are scarce then ?—Yes, and we are obliged to take such like fish as this in order to get a living.

15,695. As a fisherman is it your opinion that there is no such prospect of a decrease in herrings as to lead you to suppose that the quantity altogether has been seriously diminished in the Wash ?—Not in the least.

15,696. Do you think it probable that you will have as good seasons as you have ever had before ?—Yes, I believe it is very probable that we shall have a good supply this season.

15,697. Did you practise the same kind of fishing in former years that you practise now ?—Yes, for 35 years.

15,698. Are there more boats employed now than in former years ?—Yes.

15,698*a*. You are a mussel-fisher as well as a herring-fisher ?—Yes.

15,699. Have you had many years experience of the mussel beds ?—Yes.

15,700. Twenty or 30 ?—Yes.

15,700*a*. Did the mussel beds 20 or 30 years ago yield as many mussels as they do now ?—No.

15,701. Do you remember any period when the mussel beds were much fished out ?—Yes.

15,702. When ?—About seven years ago.

15,703. What was the cause of that ?—By taking them away previously for manure in the manner they are doing now from Brancaster and Thornham.

15,704. Do they take the same kind of mussels that you take for bait ?—They take all the small brood away.

15,705. Is not the same kind taken for both purposes ?—No.

15,706. Do you pick them ?—We take the largest.

15,707. Do you throw the small ones back again ?—There are no small ones with the large.

15,708. Are not small mussels found with the large ones ?—No.

15,709. Do you send no small ones with the large mussels when you send them away for bait ?—No, only a few odd ones.

15,709*a*. You pick them for bait ?—We pick up the best both for bait and for consumption in the manufacturing districts.

15,710. Are no small ones taken for food ?—No.

15,710*a*. Do you bring no small mussels ashore ?—No.

15,711. Do you riddle them ?—Yes, but there are no small ones among them.

15,712. How can you prevent yourself from taking small ones ?—On one bed they are all large mussels, and on another they are all small.

15,713. Do those who take the mussels for manure go on the same beds that you do ?—They go where the small mussels are, and they collect the brood at the time we are getting large mussels. They collect them and take them for manure. If they were allowed to remain they would be distributed by gales of wind and strong tides, and would be distributed over a larger space for us to collect at a future time. But they are not allowed to remain. There were two boats, both belonging, I believe, to Brancaster taking them away for six, seven, or eight weeks.

15,714. And are they of quite a different age from the mussels that you take for bait ?—Yes, they are decidedly, and they are a much smaller mussel.

15,715. Do you riddle the mussels you take for bait ?—We don't riddle anything at all. We only take the dirt away. We dare not take any small mussels because they would not suit our markets. We take them as nearly as possible all of one size.

15,716. Have you had a large supply of mussels during the last three years ?—Yes.

15,717. What has been the cause of that large supply ?—Seven years ago the brood fell. They were three years breeding. In some places where the fresh-water ran over them they grew extra fast and laid

thick on the beds. They grew like a lot of oysters, remarkably fast and we always take the largest.

15,718. Have you fished oysters here?—Yes.

15,719. Are there any good oyster beds?—No, we are badly off in that respect.

15,720. Are they all fished?—Yes, we have no oysters about us to speak of.

15,721. Did you ever have any large quantity of oysters?—Yes.

15,722. How have they become exhausted?—In consequence of foreigners coming among them.

15,723. Have they cleaned the beds out?—Yes. I recollect about 15 years ago that we found a very fine bed outside the Boston Gat, but a lot of people came and cleared them out in the course of a month or six weeks.

15,724. Were they entirely taken away?—Yes, entirely.

15,725. Have there been none since?—No.

15,726. (*Professor Huxley.*) I did not understand what you stated just now with regard to riddling the mussels. The water bailiff told us that the mussels obtained for food were regularly riddled through sieves?—Yes.

15,727. Is that operation of riddling not performed to separate the large ones from the small ones but merely to get the dirt off?—Just so.

15,728. Are there no small ones?—Only a few, we do not take any small mussels.

15,729. How can you help it when you are raking them up with a rake?—We only go where the large ones are. I brought up a hundred strike to-day and there would only be two or three bushels with cockle shells, that is all out of the lot that would be small.

15,730. Do you think that the big mussels keep together?—Yes.

15,731. You were speaking about the herrings caught here, have you ever been herring-fishing yourself?—Yes.

15,732. The herrings you catch here are different from the north country herrings?—Yes.

15,733. And different from the Yarmouth herrings?—Yes.

15,734. What is the average size of your herring?—About 14 inches, I think.

15,735. Fourteen inches?—Yes, 12 or 14 inches.

15,736. Why a north country herring would be a good-sized herring at 14 inches?—Perhaps they will only be 12 inches. Ours is a small thick herring.

15,737. I think 12 inches would be the average size of the north country herring?—Ours is smaller than the north country herring.

15,738. What time of the year are your herrings full?—They begin to get full directly.

15,739. Are they all full fish?—Yes.

15,740. How long do they keep full fish?—Generally until March.

15,741. Do they become spent after that?—Yes.

15,742. Where do they spawn?—We believe that they spawn in our Deeps, I have known them spawn there.

15,743. How do you know that?—We have seen the spawn.

15,744. Have you ever found spawn in the net?—No.

15,745. You spoke of there being a particular season for mussels?—Yes.

15,746. What is the season for that?—The season is confined from August to May.

15,747. Are there any got during the rest of the year?—Yes, they are good May over.

15,748. Are they not good between May and August?—They are not as good then because they are spawning.

15,749. Do you not fish for them in those months?—A few odd ones occasionally we get.

15,750. Is that because they are considered out of season and are not so marketable?—Yes.

15,751. (*Mr. Lefevre.*) Is there no sale for them at that time?—No.

15,752. Will they not sell for bait?—No.

15,753. Nor for food?—No, nor yet for food.

15,754. Are they taken for manure then?—Yes, they are sold for manure at that time.

15,755. Then the fishing does go on during the whole year?—Yes.

15,756. Do you think that by any regulation as to close time the supply of mussels would be increased?—It might be if these parties were prevented from taking them for manure. The mussels might then have three or four years more on the beds before they were taken.

15,757. How long is it before a mussel is fit for food?—About three years.

15,758. Is it only in the third year that they are large enough to take?—Yes, at first they come about the size of linseed.

15,759. What size are they after the first year?—About the size of a large bean.

15,760. And what the second year?—They are then ten times as large, I should say. It depends on the season of the year and the weather whether they grow fast or not.

15,761. Does it also depend to some extent on the quantity of them?—Yes; the thicker they are the less they grow, and the more they are separated by gales of wind and so on the better they grow on the beds.

15,762. Do you think the regulations as to riddling on the banks do harm rather than good?—We could not carry them out.

15,763. Do you riddle them in the boats close to the banks?—No, we cannot; when we are there we are up to the knees in mud on the banks.

15,764. Could you not riddle them in the boats?—No; it was utterly impossible to carry them alongside the smack, and to riddle them when we were up to the knees. We should have no water there to wash them with.

15,765. But how is it when you get to the boat; do the boats lie dry?—You can riddle them when you get to the water. It is quite the same whether we try to riddle them in a row-boat or in the smack. It is utterly impossible that we could do so.

15,766. Do you recollect the time when that regulation was attempted to be enforced by the corporation?—Yes, I recollect it well.

15,767. Were they able to enforce it?—No, they were not.

15,768. Was it found impracticable?—Yes, it gave the fishermen here privileges, I believe. We took all our refuse down, and there were parties who took it for manure from the railway stage. I believe it is found to be a remarkably good manure.

15,769. Do you know what it fetches for manure?—Our people make something like a shilling a ton of it.

15,770. Not more than that?—No, it is only the refuse out of the tubs after the mussels have been washed. There are cockle shells, a few cockles, a quantity of cot, and so on.

15,771. What is "cot"?—It is a kind of weed; parties wish to have it for manure.

15,772. Do you know whether any large quantities of mussels are sold for manure, and are simply mussels instead of being the refuse?—Yes.

15,773. What do they get for it a ton?—About 15 shillings.

15,774. Can you tell us what proportion of young herring you find among the sprats; is it any large proportion?—It depends how the shoals go together; I cannot tell you. The sprats go by themselves in general, and the herring in general go by themselves.

15,775. Is there a difference in the price you can get for the sprats and the young herring?—Yes, decidedly.

15,776. What is the difference?—Sometimes for eating full grown sprats will be worth more than young herrings, and sometimes the young herrings will be worth more than the sprats.

15,777. Is that when they are poor?—Yes.

15,778. Out of condition?—We never catch them when they are out of condition.

15,779. Do you ever fish purposely for young herrings?—When our net goes overboard we catch anything that comes in.

15,780. Do you find that the young herrings decrease in number?—Only this last season they have left us, but not owing to our catching the small fish, but to the winds. The winds take all our fish off; the winds and the red weed that I told you about.

15,781. Do the men catching herring along the coast catch the same herring that you have been speaking of?—Yes.

15,782. Has their catch fallen off?—No, it is the same, I believe. They got a nice lot last September, and from January to the beginning of March; then the herring went altogether. The south winds set in and they went off.

15,783. How many boats go after herring from Boston?—Not more than 10.

15,784. Is that more than went off five years ago?—Not more.

15,785. Is it about the same?—Yes, I have diminished my fleet of herring nets, and several others have done the same. I have a sprat net also. We have about 20 sprat nets altogether.

15,786. Have you a herring boat?—No, I have only three or four lengths of herring nets. I cannot fit out a fleet.

15,787. Have you been out herring-fishing?—Yes.

15,788. With your own nets?—Yes, but not for these last two years.

15,789. How long have you been a fisherman here?—37 years.

15,790. Have you found that your average earnings have fallen off much?—No.

15,791. Have they been about the same?—They have been better latterly. I was brought up to the smelt fishery and to our fresh-water fishery previously to being in this trade. I have been 14 years in this trade.

15,792. Has the number of fishermen in Boston increased?—Yes.

15,793. What has been the increase since you can recollect?—I cannot say.

15,794. How many are there now?—I think we have 50 or 55 boats.

15,795. Of all kinds?—Yes.

15,796. How many boats had you 20 years ago?—I cannot tell you exactly, but 20 or 25 years ago we had a little more.

15,797. (*Mr. Caird.*) Over what extent in miles do the mussel banks stretch?—There are very many different mussel banks. The Lynn men and the Wisbeach men fetch them as well as the Boston men. We have eight very good banks, and they extend, I think, about six miles along the bay and they are five or six miles wide.

15,798. Then your mussel banks are about six miles square?—They are perhaps more. The channel runs between them.

15,799. Do you fish the mussels at low water?—Yes.

15,800. Do you gather them when the water is off the banks?—Yes.

15,801. Then you can see what size you are taking up?—Yes, and we put beacons down to mark what we intend to take the next time we go. After we have been one day for a boatload we put a beacon there, and we are thus enabled to take our boat directly to where we can find the larger stuff.

15,802. When you are picking them off the mussel beds do you take them clean off?—No, we do not take the whole of them, but we get them as clean as we can.

15,803. As clean as you can of the size you want?—Yes.

15,804. Do you think it would be of advantage if some regulation were adopted by which the beds could be taken in succession, so that some might not be fished at all?—I cannot see that. If they would not fish it for manure it would be possible. A gale of wind frequently shifts the small mussels on to the lower beds, and in the course of three or four months they will grow as large again and become fit for consumption.

15,805. Would it not answer to have beds in succession coming in year after year, one after another?—It would be impossible to fish them in that way unless a fresh brood came. It would make no difference.

15,806. The fresh brood would come and be left for three or four years, so that it might come to perfection before it was taken. You would not fish the small beds at all?—We do not that now. If we have a gale of wind that shifts them off, and in a short time they grow large.

15,807. Do you think that they are shifted about from bed to bed as the wind takes them?—Yes.

15,808. And that you could not have a succession of beds such as I have been speaking of?—Decidedly not. We go regularly where the large mussels are, and not where the small ones are.

15,809. (*Professor Huxley.*) Are you of opinion that the mussels shift so easily as that?—Yes, they are shifted by gales of wind.

15,810. Then do they shift in a mass?—Decidedly, and they fall over where the fresh-water runs down, the same as in an oyster lay. They grow remarkably then.

15,811. Is that in consequence of the fresh-water?—Yes.

15,812. How can fresh-water affect them, particularly on these banks?—I take it that they are dry for eight or nine hours.

15,813. How can that be so, they are covered twice in 24 hours; are they nine hours dry?—Yes, the higher beds are in general.

15,814. But on these sandy muddy banks the rain water cannot lie?—There are fine runs there, and the gales of wind shift the mussels into the runs. In heavy rains they go in these runs and feed on the fresh water.

15,815. But the mussels cannot move themselves about?—I am aware of that. They are shifted about by a gale of wind.

15,816. I do not understand what they are to feed on in the fresh-water, there is no food in that?—Yes, there is, and in salt water too.

15,817. I cannot understand how showers of rain could do them much good?—I will give you an explanation of that. Before these beds were formed we had some old mussels that were good for nothing. They were taken into Brancaster harbour, where there is beautiful spring water running over. They keep their oysters upon those lays which are composed of blue clay, and spring water runs for nine or 10 hours. It is beautiful clear fine water. The salt water comes over them also, and I take it that the salt water feeds them and the fresh-water as well.

15,818. Does not the salt water do it, and not the fresh?—I think the fresh-water does it also. We get the finest mussels from our haven when the water flows in.

15,819. A river is a different thing, it contains food of different kinds, but rain coming down from the sky cannot contain much food?—The fresh-water I speak of runs over the banks in large quantities, and forms a sort of creek, where the mussels lie.

15,820. Yes, but we were talking at first about these banks covered by the sea water. All the food they can get must be derived from the sea water; they cannot be fed by rain water?—It is fresh-water that passes over them, and we believe that they take nourishment from it.

15,821. (*Mr. Lefevre.*) Is there any spawn or brood of mussels sold here?—No.

15,822. You never heard of such a thing?—No, it comes at first like linseed. We find it on the buoys which form the passage up and down Boston and Lynn Deeps, but there is never anything of that kind gathered for sale.

BOSTON.

. Cousens.

Nov. 1863.

15,823. It is never gathered up by anybody, and sold?—No, 24 or 25 years ago I was coming from Scarborough into Boston Deeps, and I noticed a formation of mussel spawn going on. It was a red spawn on the top of the water, and afterwards we found it on the Toft. We thought it was mussel spawn, but whether it was or not I cannot tell.

The witness withdrew.

. T. White.

FRANCIS THIRKILL WHITE called and examined.

15,824. (*Mr. Lefevre.*) You are the town clerk of the borough of Boston?—Yes.

15,825. We have been informed that the corporation of Boston have jurisdiction over a great portion of the Wash called Boston Deeps?—Yes.

15,826. Under what charter is that jurisdiction held?—Under various charters of King Henry the Eighth and Queen Elizabeth. Those are the principal charters that relate to this subject.

15,827. Perhaps you will point out in the earliest charter the part which particularly affects the rights of the corporation?—I do not know whether it is particularly mentioned in the charter of Henry the 8th. I think it comes more specifically under the charter of Queen Elizabeth, which recites that for a long time the port had been in existence, and that the corporation had taken upon themselves the duty of maintaining sea marks, a duty they perform to this day.

15,828. It has no reference to the fisheries?—In consideration of that duty, in the first place, the Queen grants exemption from any power or authority of the Admiralty of England, and then creates a court to be held before the mayor of the borough and a learned person to be called judge of the court with full jurisdiction to their successors. They are to have "the "correction and punishment of all and singular the "fishermen, being delinquents, in the borough afore-"said and liberties of the same, and in the port, limits, "and bounds aforesaid, or in any of them, part and "parcel of them, and all their nets; and also full "jurisdiction and power to hold pleas and courts for "all actions, controversies, and demands whatsoever." That is a court authorized to be established in the borough independent of the Admiralty.

15,829-30. Is there any power given to you to make regulations affecting the fishing here?—No further than that. I think it may be considered to be covered under the general terms of the charter: "Moreover, "We have granted of our abundant special grace, "certain knowledge, and mere motion from Us, our "heirs and successors, by these presents, to the "aforesaid mayor and burgesses of the borough and "their successors, that they and their successors from "time to time, when the aforesaid office of High Admiral "of England by death, forfeiture, surrender, or any "means whatsoever, first and next shall happen to be "void, shall and may for ever have the correction and "punishment of all and singular the fishermen, being "delinquents aforesaid, in the borough aforesaid and "liberties of the same in the port, limits, and bounds "aforesaid, or in any of them, parts or parcel of them, "and all their nets; and also full jurisdiction and power "of holding pleas and courts aforesaid for all actions, "controversies, and demands whatsoever, there by "reason of anything or cause concerning fishing, or "the art of fishing, by any means according to the "law and custom of our Court of Admiralty." They are very general but very large words, and they are very specific.

15,831. If in looking over your papers you find any clause that vests in you the foreshore and also the soil of Boston Deeps, perhaps you will be kind enough to give it to us?—Yes, I am not aware that there is any such clause with regard to the actual soil; I think we have only this clause with regard to the general jurisdiction.

15,832. Does the charter give any right of fishing?—No.

15,833. Then under the charter affecting the corporation there is no exclusive right of fishing to the inhabitants or to the corporation?—No, but I apprehend those words, "the correction of fishermen" would apply to all fishermen.

15,834. Has not that charter been virtually repealed by a subsequent Act of Parliament?—With regard to the Admiralty jurisdiction—whatever that amounted to—it is repealed, but inasmuch as services are rendered in consideration of which this charter was granted, I am almost inclined to think that the powers which were conferred by that charter are not repealed by that Act because it is exempt in the first place from the Admiralty jurisdiction of England, and then power is given to the mayor of the borough to create a certain jurisdiction, a certain court for certain offences therein mentioned. There may be a question in point of law whether the Act repeals the whole of the charter.

15,835. What is that Act of Parliament?—It is the 5th and 6th William IV., chapter 76, section 108. "And be it enacted, that from and after the passing "of this Act so much of all laws, statutes, and "usages, and so much of all royal and other charters, "grants, and letters patent, heretofore granted to any "borough or body corporate, whereby such borough "or any place within the precincts or liberties of the "same, or such body corporate, or the freemen or "inhabitants of the same do claim to be exempted "and released from the jurisdiction and office of the "Lord High Admiral of England or the High Court "of the Admiralty of England, or whereby any body "corporate, or any mayor, bailiff, recorder, steward, "or other chartered or corporate officer of any "borough has or claims anything belonging to the "office of Admiral whether or not it be exercised by "virtue of any commission to them or any of them "to be directed, shall be and the same is hereby "repealed."

15,836. On the assumption that the charter is still valid with regard to the rights it confers over Boston Deeps, has the corporation from time to time issued regulations for the management of the fisheries?—My late partner who was formerly town clerk entered carefully into the subject and referred to the charters and to the records of the borough in concert with the corporation of Lynn. We were anxious to act together as far as possible. The line of demarcation showing the jurisdiction of each corporation is clearly fixed. It is laid down on the Long Sand, and the charters of the two boroughs exactly agree. We issued regulations conjointly.

15,837. In concert with the corporation of Lynn did you come to an agreement as to certain regulations that were to be promulgated?—Yes, and these were the regulations promulgated after consulting with the corporation of Lynn.

15,838. How long ago is it since those regulations were made?—They were only made recently—in 1859.

15,839. In order to carry out those regulations did you appoint a water bailiff?—Yes.

15,840. Previous to that time you had issued no such regulations and had no water bailiff to look after the fisheries in any way?—No.

15,841. And you had issued no regulations with regard to these fisheries?—Pearson, one of the officers of the corporation here, will be better able to explain that.

J. Pearson.

JOHN PEARSON called and examined.

15,842. (*Mr. Lefevre.*) Were there any regulations previous to that time?—None in particular.

15,843. (*Professor Huxley.*) Was there no fishery officer?—There was a coroner whose jurisdiction extended from the Sluice Bridge to the Outer Knock buoy.

15,844. Has he anything to do with the fisheries?—No.

FRANCIS THIRKILL WHITE recalled.

15,845. (*Professor Huxley.*) Can the corporation prove any right by prescription which enables them to interfere with the fishermen under the charter. You say that the power is given; I wish to know if they have done anything to exercise it?—The records of the town say, that in the year 1555 a Scotch ship riding in the roads, laden with herrings, was compelled to come into Boston to sell the same. In the same year 1555 Nicholson the coastman and every other ship coming up had to lay up their herrings in a shop, and were not to sell the same to any person except a freeman. In 1558 no cyger was to buy any fish in the markets before eight in the summer and nine in the winter.

15,846. (*Mr. Lefevre*). That is a regulation with regard to the borough?—Yes. In 1605 a certain Alleyn was to have during his life the fishing in the haven to the extent of its liberties, provided he should give to the mayor yearly a dish of the best fish he could procure, and pay 1*s.* a year rent. In 1662 the fishing in the haven was rented for 13*s.* 4*d.*

15,847. The fishing in the haven?—Yes.

12,848. Whereabouts is the haven?—From the High Bridge to Maud Fossdyke. In 1739 means were ordered to be taken to prevent the fishing within the Admiralty jurisdiction of the borough without a licence. In 1813 the fishermen of the borough petitioned "that restrictions should be put "on the fishermen of Lynn, Sheringham, and Cromer, "forbidding their fishing in Boston Deeps in the "herring season." I believe the hall replied that they had no power to do so. The Deeps referred to in the charter form part of the great estuary of the Wash between the coasts of Norfolk and Lincoln.

15,849. No attempt was made until 1859 to interfere with the mode of fishing carried on, or to exclude any strangers from it; is that so?—Yes.

15,850. Previous to 1859 you had no water bailiff to look after the fishery, to enforce regulations, or to exclude anybody from it?—No.

15,851. In 1859 you appointed this bailiff, and issued these regulations?—Yes.

15,852. But since then you have taken no means to enforce the regulations?—Some steps have been taken, but there have been no convictions under them. I believe there have been one or two summonses issued.

15,853. But they have not been carried to a conviction?—No; for this reason, the former part of the regulations do not appear sustainable by penalties attached. The latter part, under the statute of George 2, would be sustainable.

15,854. Under Act of Parliament?—Yes, under modern Acts, and under an Act of George 2.

15,855. (*Professor Huxley.*) There is one of your regulations that I see is contrary to an existing Act of Parliament?—Which is that.

15,856. It is the regulation which states that the herring nets shall have a mesh seven-eighths of an inch from knot to knot. As a matter of fact every herring net found of that size could be seized and condemned under an Act of George 3, which regulates the size of the nets over the whole of the country. That Act obliges the mesh to be an inch from knot to knot, while your regulation is that it should be only seven-eighths of an inch?—Yes, that is so, I believe.

15,857. (*Mr. Caird.*) We remarked the same thing at Lynn?—The regulation issued by the corporation of Lynn was precisely similar to ours.

15,858. (*Professor Huxley.*) That is a somewhat remarkable fact. I am quite certain about the existence of the Act I refer to, and that it applies to the whole coast. We have had it under our consideration over and over again?—Then it can hardly have been referred to when these regulations were drawn up; they were drawn up in concert with the town clerk of Lynn.

15,859. (*Mr. Caird.*) This size of seven-eighths of an inch from knot to knot was adopted at Lynn in accordance with the wishes of the fishermen themselves as being the size most likely to catch the fish they require. It was not framed in accordance with any Act of Parliament, I believe?—I believe that was so.

15,860. (*Professor Huxley.*) For your own information I may tell you that there is an Act which states distinctly that the mesh of a herring net shall not be less than an inch from knot to knot?—I was not aware of that before.

15,861. Then all nets made in accordance with your regulation would be illegal?—Yes, so it appears.

15,862. I do not know whether the Convention applies to this part of the coast, as the Wash, I presume, would be regarded as an inland water, but the same size is laid down in the Convention?—I think the Convention with France does not apply here. It applies only to a certain distance beyond the headlands.

15,863. There is no question at all about the existence of an Act of Parliament rendering it illegal that any mesh shall be used of a less size than one inch from knot to knot?—Then seven-eighths would of course be illegal.

15,864. (*Mr. Lefevre.*) I have only one other question to ask as to the charter; have you any means of ascertaining what your legal rights are under your charter?—No.

15,865. Did you ever restrict persons from fishing here?—No steps have ever been taken to ascertain our legal rights.

15,866. (*Mr. Caird.*) Under what title do you claim jurisdiction over Boston Deeps?—Under so much of our charters as are not repealed by that clause in the Act of William the Fourth.

15,867. Can you refer us to any portion of the charter that gives you such a right?—This is the only portion—"Moreover We have granted of our "abundant special grace, certain knowledge, and "mere motion from Us, our heirs and successors, "by these presents to the aforesaid mayor and "burgesses of the borough and their successors, "that they and their successors, from time to time "when the aforesaid office of High Admiral of England by death, forfeiture, surrender, or any means "whatsoever first and next shall happen to be void, "shall and may for ever have the correction and "punishment of all and singular the fishermen being "delinquents aforesaid in the borough aforesaid and "liberties of the same, and in the port, limits, and "bounds aforesaid, or in any of them, part or parcel "of them, and all their nets; and also full jurisdiction "and power of holding pleas and courts aforesaid for "all actions, controversies, and demands whatsoever "there by reason of any thing or cause concerning "fishing or the art of fishing by any means according "to the law and custom of our Court of Admiralty."

15,868. You think that that gives you the power?—Yes; it also gives us power with regard to anchorage and ballasting.

15,869. Do you think that it gives you the power of regulating the fisheries all over Boston Deeps?—The question in point of law is whether the right of the Admiralty, which is taken away by this charter, is affected by the 108th section of the 5th and 6th William 4., which abolishes the whole of the grants under the charter.

15,870. Do you think the charter is valid *quoad* any restrictions imposed here?—We have always taken the charter to be valid.

15,871. Since 1859 you have never taken any opinion on it, or practically tried to enforce the regulations you have made?—No.

15,872. (*Professor Huxley.*) The Act of Parliament to which I referred is the 48 George 3. c. 110. s. 12. It provides that the mesh of the herring nets shall not measure less than 1 inch from knot to knot?—Then this regulation of ours would fall to the ground.

15,873. Quite so, unless this point of law were raised, that yours is an inland water and this Act does

BOSTON.

F. T. White.

28 Nov. 1863.

not apply?—There may be a byelaw applicable to inland water that is not comprehended in that.

15,874. (*Mr. Lefevre.*) Does the corporation of Boston attach considerable importance to this power of regulating the fisheries?—As far as I am justified in saying anything on the part of the corporation, I believe the members of the corporation take a great interest in the matter. It has been represented to them that the take of fish has been injured by an injudicious and wasteful mode of fishing; they have been told that nets have been improperly used, and that some of them have too small a mesh. For instance, shrimp nets have been used in catching soles. Not only are the actual meshes improper, but nets have been improperly used. The consequence has been that fish which are too small have been taken and the brood has been injured.

15,875. Was it in consequence of complaints made by the town that you issued these regulations and appointed a water bailiff?—Yes, and also in consequence of complaints made in Lynn. We were very anxious to act in concert together.

15,876. Then why have you not attempted to ascertain what your rights are under the charter, and to enforce the regulations you have made?—We have issued summonses.

15,877. But why have you not prosecuted them to a conviction?—There does not appear to be any power to attach penalties.

15,878. You have never gone to the trouble and expense of ascertaining that fact?—No.

15,879. Then I take it that you are afraid of incurring any expense with a view of improving the fisheries?—The corporation have not been able to see their way clearly in the matter. That has really been the question.

15,880. (*Professor Huxley.*) The fact being that improvement is more or less uncertain, whereas expense would be inevitable?—Yes, the corporation are quite willing to put themselves in the hands of the Commissioners if anything can be made in the shape of a suggestion by the Commissioners with a view to benefit the fisheries.

15,881. (*Mr. Lefevre.*) Would the corporation desire to have vested in them more power for regulating the fisheries than they have now?—Yes.

15,882. Would they be prepared to go to any expense in enforcing them?—Yes, I think they have shown that, inasmuch as they have already appointed a water bailiff. I think I am justified in saying that they would be ready to go to further expense.

15,883. I ask that specially because from what we were enabled to gather yesterday the corporation of Lynn are indisposed to go to any expense?—I do not think that objection would be raised in Boston. They have already gone to the expense of appointing the water bailiff with a proper boat in order to enable him to carry out the regulations, assuming that such regulations can be properly enforced.

15,884. Would one bailiff be sufficient?—Yes, I think so. As far as I can presume to say the corporation would be disposed to afford every facility to the water bailiff in carrying out proper regulations.

15,885. (*Mr. Caird.*) Do you consider that you have a right to levy any payment from the persons who take mussels from your beds?—We have never assumed any right of that kind.

15,886. (*Mr. Lefevre.*) Have you any right under your charter to restrict the number of people who are to come upon the beds?—I think we should have had if it had not been for this 108th section of the Act of William Fourth. You can hardly find words in the language more full to give them authority. The question would be, is there a practical mode of giving effect to it. The charter says "fishing, and the art of fishing." That is as full as words can be, but the machinery is wanting to enforce the jurisdiction. In one of the records I read to you just now it states that there was a complaint made against foreigners from Sheringham and Cromer in Norfolk, but the hall at that day thought they had no power to interfere in the matter.

15,887. Has the corporation ever considered whether it would be desirable to vest in them the actual soil of these mussel beds with the view of having a proper control exercised over them?—That question has not been brought forward.

15,888. Would the corporation be prepared to take upon themselves such powers?—I can hardly answer that question. There are several members of the corporation present.

15,889. (*To Mr. Simonds, the Mayor.*) Would the corporation be prepared to have the property in the mussel beds vested in them?—I think we should like it very much, and if it was vested in us then we could keep foreigners from coming there.

15,890. (*Mr. Caird, to Mr. White.*) To whom do you suppose the right of the soil belongs at present?—To the Crown within high-water mark, unless it belongs to the frontagers.

15,891. Would it not be worth while for the corporation to make an application to the Crown, and get the grant of those beds?—They would not like to incur the expense of anything like an Act of Parliament.

15,892. But they might apply for a grant to enable them to establish regulations with regard to fishing?—I believe it is the wish of the corporation to do what they fairly can to protect the fishing. They are prepared to go to some expense, but they would not like to go to any great expense. They would not be prepared to incur the cost of an Act of Parliament.

15,893. Would it not be worth while to go to the expense of obtaining a legal opinion as to the actual existing rights of the corporation?—I think so.

The witness withdrew.

The inquiry was then adjourned until Monday, the 30th of November, at Great Grimsby.

Great Grimsby, Lincolnshire, Monday, 30th November 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | GEORGE SHAW LEFEVRE, Esq., M.P.

GREAT GRIMSBY.

W. Baxter.

30 Nov. 1863.

WILLIAM BAXTER called and examined.

15,894. (*Mr. Caird.*) Are you well acquainted with the fishing trade here?—I ought to be; I have been connected with it now for more than 43 years.

15,895. How long have you been at Grimsby?—Nearly two years. I have been here altogether for about 16 months, but I have traded backwards and forwards here for several years.

15,896. Are you well acquainted with the fishing trade at Grimsby?—Yes.

15,897. Both line and trawl-fishing?—Yes, both.

15,898. Are you able to say from your experience whether the catch of fish here has increased or diminished?—There are more codfish off here this season than I ever knew in any previous year.

15,899. Is the supply of all other kinds of fish increasing also?—I do not know that there is any increase in it, but there is no diminution.

15,900. Do you think there are more fish of any kind caught and brought into the market here this year than in preceding years?—Yes.

15,901. Is there more at this moment?—Yes, I think there is.

15,902. Does that apply to every different kind of fish brought here?—Yes.

15,903. Is there any particular kind of fish that has diminished?—None that I know of.

15,904. How is it with regard to haddocks?—They are equally as plentiful now as ever.

15,905. Are they as good; are they as large in size, and as good in quality?—I do not know that they are as large in size quite.

15,906. Where are the best cod caught?—About Cromer Knoll.

15,907. At the knoll off Cromer?—Yes.

15,908. Is that ground suitable for trawl-fishing?—Yes.

15,909. Has it been trawled over?—Yes, for the last year or two.

15,910. For not more than a year or two?—No.

15,911. Do many of the line-vessels go there now to fish?—Yes, a great many.

15,912. Have they long frequented the ground?—Yes, they have frequented it for a long time; I have frequented it for the last 40 years.

15,913. With line-fishing vessels?—Yes.

15,914. Do you know whether in the course of that time the take in that part has increased or diminished?—I think it has diminished.

15,915. There are not as many caught now as there used to be?—There are more cod vessels there than there used to be when I was there 40 years ago. When I first went there were not more than four or five cod vessels.

15,916. How many are there now?—Perhaps 50.

15,917. Do you suppose that each of the 50 catches as many fish as each of the four or five did in former times?—I do not think they take as much now in each vessel as they did formerly, but there are as many taken off the ground altogether by the 50 vessels as there were altogether formerly.

15,918. We can easily imagine that there must be many more caught by 50 vessels than by four?—There are a very great many more caught.

15,919. Are the cod caught now of as prime a quality as they were formerly?—Yes, they are just as good in quality.

15,920. Are they as good as the cod caught on the Dogger Bank?—At a certain time of the season they are quite as good, and even better. They are better at this time of the season.

15,921-2. Are there particular seasons for particular banks?—Yes.

15,923. What is the cause of certain banks being better at one season than another?—Because the fish are not there at certain times of the season.

15,924. Do you know why they change from place to place?—I believe they follow the herring. If you go to the Knoll in October you will see very few cod, but when you get into November then the cod begin to come. The reason is that the herrings about that time go across, and that causes the cod to follow them.

15,925. Do you always find that the cod follow the herring?—Yes.

15,926. As a line fisherman would you generally follow a herring fleet when you observe that there are a good many herrings being caught?—At certain times of the year there are certain grounds upon which the herring come, and then the cod follow them. When the herrings take away, the cod go away too.

15,927. Does a line-smack and a trawl-smack each cost about the same sum of money?—No.

15,928. Which costs most?—I think a line-smack will cost double as much as a trawl-smack.

15,929. With all its gear?—Yes.

15,930. Is it manned by the same number of men, or by more?—It is manned by double the number of hands.

15,931. Is it more costly altogether to maintain?—Yes, it costs a very great deal more.

15,932. Which of the two has the largest catch of fish on an average; has a line-smack or a trawl-smack the largest take generally?—I cannot tell you, but as general rule the trawl-smack will catch the largest weight of fish.

15,933. Suppose that a trawl-smack and a line-smack go out together for a month's fishing, which vessel at the end of the month will bring in the greatest quantity of fish?—I cannot say. It is all according to the catch of fish. The trawl-smacks in general will bring in the largest weight of fish.

15,934. (*Mr. Lefevre.*) But the fish they catch is not of so valuable a character as that caught by the line-smacks?—No, it is not of the same quality. It is a different quality of fish altogether.

15,935. (*Mr. Caird.*) Then the catch of the line-smack, on account of its superior value, will bring the most money?—Yes; the line-boats bring in live fish.

15,936. And their smaller take may be much more valuable than the larger take of the trawl-vessel?—Yes.

15,937. Are you the owner of a line-smack?—Yes, I am.

15,938. Then, as the owner of a line-smack, can you state which of the two, a line boat or a trawl-boat, pays the greatest return for the capital invested in it?—I cannot answer that question on account of the fluctuating character of the business. Sometimes a line-boat pays best, but not always. I had a line-smack the year before last that ran me out 110*l.*

15,939. Do you mean that you lost that sum by it?—Yes.

15,940. Do you know whether or not the line-smacks are now paying on the whole?—Yes, just now I believe they are paying.

15,941. Is that because the catch has increased?—Yes; it is because the catch has increased this season.

15,942. Is it a better season for fish now than it was in the year to which you refer?—Yes, it is a much better season.

15,943. Do you remember any year in which you had a better season for fish than this has been?—Never.

15,944. Then it is not the result of your experience that the continued fishing of any particular bank has diminished the supply of fish?—No. I have known a great many fish in the north country years ago, and now there are not so many vessels fishing there, and yet there are not so many fish by a great many as there used to be.

15,945. To what part of the north country do you refer?—The Pentland Firth and on towards the Highland way.

15,946. Do you mean towards the western shore?—Yes.

15,947. Were you in the habit of fishing there in former times?—Yes, from 40 years ago up to within the last three years.

15,948. What kind of fish did you fish for there?—Codfish.

15,949. Are they not as abundant as they used to be?—They are not one half nor one quarter as plentiful as they were formerly.

15,950. What is the cause of that?—It would puzzle me to tell what is the cause, but nevertheless it is the fact that the quantity of fish has greatly decreased.

15,951. Is there any trawling there?—There never was a trawl shot there.

15,952. Is there any other part of the coast that you used to frequent formerly in which you have found that the quantity of fish you can catch has similarly fallen off?—Yes.

15,953. Where?—At Peterhead.

15,954. Has the decrease been very noticeable?—At a certain time of the season we might go there and the fish would be sure to set in. But now, at this time, there are seldom many fish caught there.

15,955. Has there been any trawling off Peterhead?—There never was a trawl shot there.

15,956. Then you cannot attribute the falling off to the use of the trawl?—No; there have been no trawlers there.

15,957. Have you, as a line fisherman, been in the habit of fishing on the same bank as the trawl fisher-

GREAT GRIMSBY.

W. Baxter.

30 Nov. 1863.

men and at the same time ?—I do not quite understand the question.

15,958. Have you been in the habit of setting your lines on the same ground and at the same time as that on which the trawl fishermen have been fishing with their trawls ?—Yes.

15,959. Have you ever found that the operations of the trawl fishermen have in any way interfered with your success ?—No, not in the least.

15,960. Did they ever foul your lines ;—No, they never foul them so as to do them any injury unless they happen to come athwart a buoy.

15,961. Do you and they often fish on the same ground ?—Yes, very often.

15,962. And do you find that the two modes of fishing can go on together on the same ground without any disadvantage to each other ?—Yes.

15,963. Have you ever found that the trawl fishermen have cleared the ground so that you could not catch fish ?—No.

15,964. Do you think that that is ever likely to occur ?—No, I think not.

15,965. Have you been in the habit of fishing on any particular places on the Dogger Bank where trawl-fishing has been going on ?—I was never where the trawl-smacks were fishing ; I have been fishing on the Dogger Bank, but not exactly when the trawl smacks were fishing; they have not been fishing there at the time I was there.

15,966. Have you been in the habit of fishing in the Silver Pits at the same time the trawl-smacks were fishing there ?—No, never.

15,967. Is there any particular ground upon which you have been fishing at the same time the trawl fishermen were fishing ?—Never in my life ; but still I know from experience that if they go clear of my buoy they will not hurt me the least in life.

15,968. Is it the case that you as a line fisherman prefer rough ground to fish on ?—Yes.

15,969. And the trawl fishermen prefer smooth ground ?—Yes.

15,970. In that way you endeavour to avoid each other's ground ?—Yes.

15,971. Do you think that the trawl fishermen, fishing on the smooth ground near the rough ground you frequent, clear away the fish so as to make it injurious to your fishing ?—No.

15,972. You never found that it had that effect ?—No, never. There have been more codfish here this season than was ever known before.

15,973. Is there much trawling carried on off here? —Yes, on the smooth ground close to the rough ground, but just off here it is all rough ground.

15,974. And on that rough ground do you fish with the line ?—Yes.

15,975. Outside the rough ground the trawl-boats fish with the trawl ?—Yes.

15,976. Has that gone on successively now for a good many years ?—Yes.

15,977. For how many years ?—I think about 20.

15,978. Have you not observed that the supply of fish on the rough ground frequented by the line fishermen has decreased in consequence of trawling on the smooth ground outside of it ?—Not a bit ; there have been more this season than for many years.

15,979. Therefore you conclude that there has been no decline in the number of fish ?—Not a bit of it.

15,980. You do not believe that there has been any decrease in the supply of fish upon the fishing grounds you frequent ?—No.

15,981. Is the quality of the fish caught by you as good as it used to be in former times ?—Yes.

15,982. Do you get any turbot with your lines ?—Very seldom ; by chance we get one now and then, but very seldom.

15,983. What fish do you principally catch ?—Cod, halibut, and skate.

15,984. Have you not found the haddock caught off the shore rather on the decrease ?—No.

15,985. Is there no kind of fish on this coast which in your experience is on the decrease ?—No, years ago, but that is before a trawl was ever shot, they decreased. There used to be a great many to the southward, but before a trawl was shot they decreased.

15,986. (*Mr. Lefevre.*) Of what fish are you now speaking ?—The haddock.

15,987. (*Mr. Caird.*) When the fish are brought in here by the line fishermen in any large quantity and the market happens not to be very good, what do you do with them ?—We put them in chests and store them.

15,988. What are the chests to which you refer ?—They are chests that float in the docks: I believe you saw them this morning. They are what you saw the codfish in.

15,989. Are they open boxes that float in the water? —Yes.

15,990. The fish are taken out of the wells in your smacks and placed in these open boxes ?—Yes.

15,991. How long will they live in those boxes in the docks ?—I have had some there for 17 days.

15,992. Have they been perfectly healthy and lively all that time ?—Yes.

15,993. Do you keep them there until the market becomes favourable ?—Yes.

15,994. So that you are always enabled to supply the market with a considerable quantity of cod ?—Yes.

15,995. Of course you find that for your own interest ?—Yes.

15,996. Do you store in these chests all kinds of fish ? Are the fish you put in in this way of different kinds or only of one kind ?—We only put cod and halibut in the chests.

15,997. Are they the only kinds that are kept in that way ?—Yes.

15,998. You never keep haddocks in the chests ?—No ; haddocks would only keep alive for a little while in the chests.

15,999. Then you are obliged to send the haddocks to market when they are brought in ?—Yes.

16,000. It is only cod and halibut that you store in that way ?—Yes.

16,001. When stormy weather comes on, and it is unsuitable for your boats to go to sea, do you obtain a supply of cod and halibut for the market from these boxes ?—Yes.

16,002. Is there generally a rise in price when you experience stormy weather and the boats are unable to proceed to sea ?—Yes.

16,003. Would the market be supplied if you had no reserve of that kind to fall back upon ?—No, very often fish are scarce even with that reserve.

16,004. Have you a large quantity stored in the docks here now ?—Yes, a great many.

16,005. Can you give us any notion of what the quantity is ?—Perhaps 700 or 800 score.

16,006. 700 or 800 score of cod and halibut ?—There are very few halibut. Perhaps there are not two.

16,007. They are almost all cod ?—Yes.

16,008. If you were obliged to send the whole of these to market at once it would greatly diminish the price would it not ?—Yes.

16,009. It would overstock the market ?—Yes.

16,010. Is there any other place on the coast where fish can be similarly stored and kept alive so as to afford a regular supply to the market ?—No, not to the same extent as at this place. They may keep a few at different places. I believe there are a few stored at Gravesend.

16,011. At Yarmouth can they store any ?—No, not at Yarmouth, They keep a few at Harwich, I think, and at Gravesend.

16,012. At Hull they cannot ?—No, the water will not allow them.

16,013. Is there too much fresh-water there ?—Yes.

16,014. Do many of the Hull boats come here ?—There are no line well-vessels belonging to Hull.

16,015. Do you ever see any spawn?—No, very little.

16,016. You never expect to find spawn?—I have sometimes seen the fish full of spawn.

16,017. Do you never look for it when you are endeavouring to find the best ground on which to fish?—We do when we are catching haddocks.

16,018. How do you look for spawn?—We put grease in the lead and when we throw it down to the bottom of the sea the spawn sticks to it, and we bring it up with the lead.

16,019. When you find spawn sticking to the lead do you think it a good place to fish for haddocks?—Yes.

16,020. Why?—We believe that the haddocks follow the spawn and feed upon it.

16,021. You do not destroy the spawn yourselves?—No, certainly not.

16,022. But you go to the grounds where you expect the haddocks will come to destroy the spawn?—Yes, We go upon the foul ground, the rough ground off here.

16,023. (*Mr. Lefevre.*) Are you still the owner of a smack?—Yes.

16,024. Have you more than one?—Yes, I have two.

16,025. Are they both line-fishing vessels?—Yes, both are line cod boats.

16,026. How long have you been the owner of a fishing smack?—About 20 years.

16,027. Do you find that a smack is as profitable to you as it used to be formerly?—Yes. When I went to sea myself; but if you were to give me two more now I would not be troubled with them.

16,028. Since you left off going to sea yourself have you not found the business as profitable as it was before?—No.

16,029. When did you buy your second smack?—About seven years ago.

16,030. When you fished off the Pentland Firth, where did you bring your fish to?—London.

16,031. Then you salted it before you carried it to market?—Yes.

16,032. You had a well in your boat also, I presume?—Yes.

16,033. When did you begin to fish off the Pentland Firth?—About 43 years ago.

16,034. Have you noticed whether the price of cod has diminished very much from that time to this?—No, I think that we get as good a price for cod now as we did then.

16,035. Can you tell us what is the number of line-boats at Grimsby?—I am sure I don't know.

16,036. Have you experienced any difficulty in obtaining bait of late years?—Sometimes, in bad weather, but we can always find a supply of bait in fine weather.

16,037. Do you pay more for it now than you did 40 years ago?—No, we pay nearly about the same price; I have not noticed much difference in the price of bait, and when we have fine weather we can get plenty of it, but in bad weather we sometimes run short.

16,038. Do you find the herring spawn mostly on the rough ground or the smooth ground?—We find the young codfish generally on the rough ground.

16,039. I am asking you where it is that you find the herring spawn. Do you find that on the rough or the smooth ground?—On the rough ground.

16,040. Not on the smooth ground?—No, not a very great deal.

16,041. Do you happen to know what other fish feed on herring spawn besides the haddock?—Codfish will feed on it.

16,042. Will soles feed on it also?—No, I never saw any herring spawn in a sole.

16,043. Do you find soles more upon the smooth than upon the rough ground?—Yes. They could not take them upon the rough ground if they were there. They cannot work with the trawl on rough ground. It would tear their nets all to pieces.

16,044. You do not catch soles with the line?—No, they are caught by the trawl.

16,045. How many men do you have on board each of your line smacks?—10 hands.

16,046. How do you pay them?—The mate gets 22*s.* a week and the men 20*s.* each. The captain has nine per cent.

16,047. Do they share in the fish you catch?—No, we pay them all wages. The mate gets 22*s.* a week, and the men 20*s.*, and we find them in provisions.

16,048. You say that you pay the captain differently from the men?—Yes.

16,049. You give him a share?—Yes, nine per cent.

16,050. (*Mr. Caird.*) Has the price of fish, within your experience much altered?—No, I have seen greater prices years ago.

16,051. Is the price lower now than it was some years ago?—No, not generally. At times it would be very low then, but I have seen it higher a good many years ago than it has been recently.

16,052. Is the price at this moment as low as you have known it?—No, I have seen it lower.

16,053. Then is the price at present about an average price?—Yes, I should say it is about an average price.

16,054. An average price for all kinds of fish?—Yes.

16,055. Do you notice whether the prime fish have more increased in price than the lower quality of fish?—No; I have seen better prices years ago than we see now.

16,056. But looking back to your experience of say 10 years ago, would what are called the offal fish bring more money now than they did formerly; has there been a greater increase in the price obtained for offal fish than for prime fish?—Yes, there has been a greater increase in the price of offal fish.

16,057. What is the reason of that?—The reason is that they make a different use of the offal fish now from what they did formerly, especially the haddock.

16,058. What different use is made of them?—They smoke them now. Years ago they did not smoke them. Then we caught plenty of haddocks and threw them overboard as being of no use.

16,059. Then the introduction of smoking has increased the price of haddocks?—Yes.

16,060. And does it make a certain market for them at all times?—Yes.

16,061. Has there been an increase in the price of plaice?—No, but I have known them to be much lower years ago than they are now.

16,062. Then they have increased in price?—Yes, but it varies according to the weather and according to the catch of fish.

16,063. (*Mr. Lefevre.*) I think you said that you lost 110*l.* in one season?—Yes.

16,064. When was that?—Two years ago.

16,065. Is it since you left off being captain of your own smack?—Yes.

16,066. Are you making money this year by your smacks?—Yes, I have got a little money by them lately.

16,067. You have realized a profit from them?—Yes.

The witness withdrew.

HENRY KNOTT called and examined.

H. Knott.

16,068. (*Mr. Caird.*) Are you well acquainted with the fishing trade at Grimsby?—Yes.

16,069. Have you been some years engaged in it?—Yes.

16,070. Can you tell us whether the supply of fish brought in here has increased or diminished of recent years?—It has increased considerably.

19,071. Have you any figures you could place

GREAT GRIMSBY.

H. Knott.

30 Nov. 1863.

before us to show what the increase has been?—I have no figures, but I can give you the result of my experience. 20 years ago I came from the south and took up my residence at Hull. There were then only three smacks fishing from the port of Hull, and now there are about 300. Five years ago some of us left Hull and came to Grimsby. As our experience taught us that Grimsby had more natural facilities than Hull we came here to reside. I have fished over nearly all the fishing grounds from Hastings down to Hartlepool, including the Silver Pits and the Dogger Bank, down as far as the Dutch coast. At times I have found that the fish have fallen off on some grounds while they have been plentiful on others, but looking at the question generally I have found an increase in the fish caught and landed both at Hull, and at the present time at Grimsby, over and above what was caught and landed 20 years ago, or even 10 years ago.

16,072. You speak of an experience of five years at Grimsby?—Yes.

16,073. Has the number of vessels engaged in fishing increased during those five years?—When I came here there were five or six smacks brought from Hull. There were none of our sort here then, but now we have near 70.

16,074. Your sort are trawl-vessels?—Yes.

16,075. You are not engaged in line-fishing?—No, the system I follow is strictly trawling.

16,076. (*Mr. Lefevre.*) How many vessels have you got?—Three.

16,077. (*Mr. Caird.*) Has the increase from 5 up to 70 been a gradual increase or has it been sudden?—It has been a gradual increase. They have been built and bought year after year. Many have been built by persons now in this room.

16,078. Has the price of fish increased or diminished during that time?—It has rather increased.

16,079. Rather increased?—Yes. When the fish is very scarce we find that the markets are as high as they ever were, and even above what they were something like 18 or 20 years ago; but taking a fair average I do not see much difference in the price.

16,080. Taking your experience of five years at Grimsby has there been much difference in the price?—Yes, the price has increased.

16,081. Has there been a gradual increase in the price?—Yes, a gradual increase.

16,082. Does that apply to all sorts of fish?—Yes, to all sorts I have to deal with.

16,083. Specify the different kinds of fish you have to do with?—Turbots, soles, brill, plaice, haddocks, skate, and so on. Sometimes we get a little codfish, but very little of that sort generally.

16,084. Which do you call offal fish?—Plaice and haddocks.

16,085. Has the quantity of turbot, soles, and brill increased since you came here?—In some parts of the year and in some seasons we get a great deal more than in others. Sometimes at this season of the year we find soles slack, and at others they are very plentiful. They are very plentiful just now, and for the last three years I should say there has been an increase in the quantity of soles and turbots caught and landed at this port.

16,086 Are the quality and size of the fish as good as they have been?—Quite as good.

16,087. You don't perceive any diminution in the quality or size of the fish?—Not any whatever.

16,088. Has the price of turbot, soles, and brill on the whole increased during the last five years?—Yes.

16,089. Taking the offal fish,—plaice, and haddocks, they are a lower priced fish, are they not?—Yes.

16,090. Has the price of plaice and haddock increased in the same degree?—The price of haddock has increased more particularly.

16,091. Is that from scarcity or from a greater demand for haddocks?—I can corroborate Mr. Baxter's evidence. We used to throw the haddocks overboard. We could not sell them until they undertook to smoke the haddocks. Since then haddocks have been in great demand and the price has increased.

16,092. Then it has not increased in consequence of the scarcity of haddocks, but because a new outlet has been found for them?—Yes.

16,093. Has plaice increased in price in the same proportion as the finer qualities of fish?—There has not been so great an increase in the price of plaice.

16,094. Can you tell us what will be the proportion of prime and what of offal fish in an average take?—I could not give you that just now. It would be necessary for me to go through my books in order to ascertain it. It fluctuates very much. Some weeks we have a large take and other weeks only a small one. You could not get a fair average unless you took six or twelve months right through.

16,095. Generally speaking, from the fact that the offal fish brings a lower price, there must be a larger quantity of it?—Yes.

16,096. Could you by looking at your books give us some certain facts upon that point?—Yes.

16,097. Will you do so?—Yes.

16,098. Does the place where you fish at all influence the proportions of the different kinds of fish you catch?—Yes.

16,099. Are there certain grounds on which you get a larger quantity of prime fish in proportion to the quantity of offal?—Yes, when we fish close to the rough ground we get more prime fish than we do when we go further off into the clear ground.

16,100. Do you with that knowledge direct your vessels occasionally to take one fishing ground and occasionally to take another?—Yes.

16,101. Just as you think it likely to suit your own views with regard to the market price?—Yes.

16,102. So that you can in some degree regulate the proportions of fish you bring to the market?—Sometimes, if the weather permits, we can do so. If there is strong blustery weather we cannot go near the rough grounds at all; we are forced then to fish upon the fine grounds.

16,103. Then in stormy weather the largest proportion of your take will be offal fish?—Yes, unless we have an extremely cold and severe winter. Then the soles are in great abundance in the Great Silver Pits and about there, as they have been in years gone by.

16,104. Will you name the different fishing grounds your vessels frequent from Grimsby?—Yes; there are what we call the "off grounds."

16,105. Will you be good enough to begin at the Thames and name them in regular order?—We fish off the coast of Holland sometimes.

16,106. Do you go as far down as Dungeness?—Yes, I have been fishing in Rye Bay, but my vessels have not, they don't go there.

16,107. Where do they frequent?—About 40 miles off east-north-east, off the Humber, that is the first ground they go upon.

16,108. Is that the Outer Silver Pits?—Yes.

16,109. The Dogger Bank?—Yes, inside, and from off Flamborough Head.

16,110. Do you go north of Flamborough Head?—Very little; sometimes we get as far down as the latitude of Scarborough, but not often. There is no fishing ground there, it is only along the shore.

16,111. (*Mr. Lefevre.*) As you go further north you are obliged to go further in?—Yes.

16,112. (*Mr. Caird.*) What depth of water do you find is most suitable for trawl-fishing?—The best water in which there is most fish is not too deep. We generally fish in water from 15 up to 50 fathoms in depth.

16,113. You seldom go beyond 50 fathoms?—We cannot very well go beyond 50 fathoms. It is only very seldom we go up to 50.

16,114. (*Mr. Lefevre.*) There is not much water in the North Sea that is 50 fathoms deep?—Only at the east end of the Great Silver Pits, although the average depth of water at the Great Silver Pits is not as much as that.

16,115. (*Mr. Caird.*) When you come south, where do you come to ?—Out at the back of the Leman, just inside of it, and so on.

16,116. Do you go to Smith's Knoll ?—We fish close to that in fine weather.

16,117. Do you go any further south ?—No ; not from Grimsby. We go across the south side from the Brown Bank along the Dutch coast.

16,118. That is in the summer time ?—Yes.

16,119. You never fish on the Dutch coast in the winter ?—No.

16,120. In the summer time you get good catches of flat-fish there ?—Yes.

16,121. Has every one of the grounds you have pointed out to us been long frequented ?—Yes.

16,122. In consequence of being repeatedly trawled over has any one of them become less productive in fish ?—Not one that I know of.

16,123. There is no fishing ground that you have found falling off in the supply of fish it yields ?—We may have found them beginning to give in, but then in a month there will be an abundance of fish caught in them.

16,124. You have never exhausted any particular ground ?—No.

16,125. Have you fished the Great Silver Pits ?—Yes.

16,126. Is it not the case that vast quantities of soles were found there when the Silver Pits were first discovered ?—Yes ; the meshes of the net were like a mat with the heads of the fish stuck in them.

16,127. Is there not the same abundance now ?—That arose in a very exceptional case. It was an exceedingly cold winter, and in such a season we generally find abundance of soles in the Great Silver Pits, in the deep water, sheltered on each side by the banks.

16,128. Then the decrease in the Silver Pits is not caused by the place being fished out, and you think on the return of favourable weather that you can get plenty of fish there ?—Yes.

16,129. Is that ground particularly favourable for catching soles ?—Yes, and haddocks.

16,130. (*Mr. Lefevre.*) How long have you been a smack owner ?—About five or six years.

16,131. Did you begin with one smack and increase up to three ?—Yes, or rather I began with a piece of one.

16,132. Do you yourself go out to sea now ?—No, I have not been to sea for five years.

16,133. Not since you became a smack owner ?—No.

16,134. Have you found it on the whole a profitable business ?—Yes, I have got a living, and I have increased my property somewhat.

16,135. You have not lost money since you became a smack owner ?—No, I have got money.

16,136. Do you find variations taking one year with another ?—Yes.

16,137. In some years you have made more than in others ?—Yes ; there is not a more fluctuating business under the sun than ours.

16,138. Have you lost any money in any year ?—No ; if I lost at one time I got it at another.

16,139. What is the tonnage of your boats ?—I have one boat 38, another 39, and a third is just over 56 tons.

16,140. What is the length of the beam of the trawl ?—They run from 40 to 42 feet.

16,141. You are aware that 38 is the legal beam ?—No, I am not.

16,142. Is there nobody here on the part of Government to look after the beams and nets of the trawls ?—No, I think not.

16,143. Do you find the larger the boat the longer the beam you require ?—No ; small vessels have the same. We have some small vessels about 32 tons, and they have as long a beam as mine of 56 tons.

16,144. What is the weight of the iron heads of your largest boat ?—About 230 lbs. perhaps.

16,145. Not more than 230 lbs. ?—No; they vary a little. I don't know the exact weight of those that were sent on board my last vessel.

16,146. What do you weight the rope with ?—Nothing ; we only round it with the rope ; we don't put any weight whatever on it. We are forced to have a little more spread, because we don't use any heavy ground-rope. We refrain from using a heavy ground-rope, because we should mangle the fish if we did.

16,147. What is the size of the mesh of your trawl ?—It is very nearly Government size.

16,148. Then you know there is a Government size as to the mesh of the net ?—I have heard so ; I don't know the exact size.

16,149. You don't know what it is ?—No.

16,150. Have you ever inquired ?—No. The same trawl we have now was what I was taught to use 20 years ago. Our trawls have never varied.

16,151. Do you find that this, on the whole, is a better place to send your smacks from than Hull ?—Yes, it is a far better place. It has many more natural facilities, and the metropolis is more available, and we can get our fish to the manufacturing districts quite as readily. In fact there are a great many Hull vessels that land their fish here on account of the facilities we possess.

16,152. But the increase at Grimsby has not been from vessels leaving Hull and other places ; but, on the contrary, it is owing to a natural increase due to Grimsby itself ?—Yes ; we have had perhaps a dozen vessels that have left Hull and come here, but the others have been built and brought from other places.

16,153. Is the number of boats coming here increasing year by year ?—Yes, there is an increase this year (1863) of about six smacks.

16,154. Do you find that any large proportion of the fish brought up in your trawl-boats is damaged ?—No, I never observed the fish damaged except sometimes when the winds were against us preventing us from coming to land at a time when there was no means of keeping the fish.

16,155. Do you send ice in your boats ?—Yes, when we can get it. I have had ice now for six months right on.

16,156. It depends upon your being able to get ice whether you can bring in your fish fresh ?—Yes, we nearly all of us take ice. We have adopted that plan in order that we may bring our fish into market fresh. We formed ourselves into a company. There were perhaps about 15 of us, and we laid out 2,000*l.* or 3,000*l.* a year on ice.

16,157. You formed yourselves into a company ?—Yes.

16,158. How many belonged to the company ?—Fifteen.

16,159. Do you mostly fish together ?—The company I mean was simply a company of gentlemen on shore.

16,160. Not of smack owners ?—Not altogether of smack owners ; smack owners and fish merchants.

16,161. Do you ever find that the fish come in with their gall bladders burst ?—No.

16,162. You have never observed that ?—No, except they have been ripped at sea. We take off the fish's head at sea, and that is the only time I ever saw the gall bladder burst. In fact, we take nearly all the inside of the fish out, the gall included, and throw them away.

16,163. Do your boats fish in company ?—Not often.

16,164. Do you find much difference in the results of the fishing of different boats ?—One boat may catch a great deal more than another, but then the one that caught most may perhaps fail on the next occasion, and the one that caught the least may catch the most.

16,165. Do you find, on an average, that they bring in about the same returns ?—There is not much difference.

16,166. Do the larger boats bring in more than the smaller ones ?—If a boat is very small, a moderate

GREAT GRIMSBY.

H. Knott.

30 Nov. 1863.

sized one will bring you in more than a very small one.

16,167. Do you think it desirable that the Government should fix any length of beam for the trawlers?—If they don't allow it to be over 45 feet, I think that would be long enough.

16,168. What reason have you for restricting it to 45 feet?—I have no reason; I have no wish to interfere in the matter, but I think, according to the size of our nets, that would be long enough.

16,169. According to your experience, a beam of 45 feet would be desirable for the fishing here?—Yes, I believe the beams are as long as those used in the west country now.

16,170. What is the tonnage of the largest trawler out of Grimsby?—56 tons.

16,171. Then yours, in fact, is the largest?—Yes.

16,172. Yet you have not found it desirable to have a longer beam than 42 feet?—No; the same sized beam, nets, and heads as will go on board a smaller boat of 29 tons—the same sized net and the same sized apparatus altogether.

16,173. Have you had any complaints of your men from the herring boats with regard to any interference on their part with the herring nets?—Yes, I have experienced considerable difficulty in the herring season myself in that way. They drift on these grounds together, and our living is frequently entirely sacrificed in consequence. We have to go elsewhere, away out to sea, to clear them altogether, and if in the summer time the wind is from the westward we cannot get on as well as if we were nearer in.

16,174. Do you give your men instructions to keep clear of the herring boats?—Yes, to our own sacrifice frequently.

16,174*a*. Are you aware that the law compels you to keep three miles off from the herring boats?—That is rather an arbitrary law, because they come and monopolise the smooth places on which we have to trawl. If you go over the chart you will find that there is only one-third of the ground available for trawl-fishing purposes; while the herringers could fish over two-thirds and even more than that.

16,175. But were you aware of the existence of such a law as that to which I referred?—No, I was not.

16,176. Have you had any demands made upon you for compensation by herring men?—Yes, once.

16,177. Did you have to pay anything?—I did.

16,178. Was it for damage done to their nets?—Yes, for supposed damage. It was done to a French boat.

16,179. Was that claim made before the magistrates here?—No, it was made through the French consul at London, and was sent down to the Custom House here at Grimsby.

16,180. What did you pay?—I had to pay 6*l.*; but some of our smack owners have frequently paid as high as 20*l.* for supposed damage.

16,181. When your men come to the herring nets do they take up their trawls?—The difficulty is that in the night time we cannot see their nets in the water until we have actually caught them. We cannot go out of the grounds over which we have to trawl. We also have to go with the tide, and we never know that we have caught the herring nets until we have caught hold of them with the warp. Sometimes they reach three miles in length, and you cannot see the boats at all until you have caught their nets.

16,182. Are you of opinion that it is advisable that any regulations should be made with regard to trawlers and herring boats?—Yes, I think it is highly advisable that some regulation should be made.

16,183. What would you desire?—I would have them keep on the rough ground. If they only kept on the rough ground I would allow them to go where they liked. In that case they would not interfere with the trawling smacks.

16,184. But if the herrings were on the smooth ground, do you think the herring boats should be prevented coming for them?—That would not prevent them going after them if they did not get in the way of other vessels.

16,185. Suppose there were no trawlers on the ground, would you make them keep out of the way?—I can hardly give any opinion upon that.

16,186. (*Mr. Caird.*) Is it not the case that the herring is often found upon the smooth ground upon which you are engaged in trawling?—Yes.

16,187. Then it would be a great hardship upon the herring fishers if such a regulation as you mention were adopted?—No, it would not, for this reason; they say, and no doubt it is a fact, that where trawling goes on the trawl stirs up the loose stuff at the bottom of the sea, and causes the herring to come there in order to get the food that the trawlers stir up. The herring boats generally look out for a fleet of smacks, and they keep as close to them as possible.

16,188. But if there was a regulation preventing them doing so, they would not catch those herrings?—If there were no trawling smacks there at all, they would find herrings, no doubt.

16,189. If you were told that the trawlers here had exhausted their own coast, and were therefore going north to new grounds, would you believe that was true?—North of the Humber?

16,190. Yes?—I don't believe they will go there, because there are no fishing grounds there.

16,191. There are considerable grounds frequented by trawlers north of the Humber?—Yes, in the summer time, but they are of no value in the winter time.

16,192. Trawlers go down as far as the Tyne, do they not?—Yes, along the shore.

16,193. Along this shore they don't keep in-shore at all?—No. They are obliged to do so on the Scarborough grounds and round off Flamborough Head, but our smacks at Grimsby don't fish within 30 miles of the shore.

16,194. If regulations were adopted that would restrict you from fishing within the headlands, would it be injurious to you?—Not at all.

16,195. Or within a certain distance of the headlands?—I should not mind that.

16,196. It would not be injurious to be kept outside of them altogether?—I think not.

16,197. You don't catch a large quantity of your fish within the bays at all?—No.

16,198. You never fish in the bays?—No.

16,199. (*Mr. Lefevre.*) Are there any line fishermen in open boats at Grimsby?—No.

16,200. Are the line-fishing boats all smacks—decked boats?—Yes.

16,201. Do you find any complaint here against your men on the part of the line fishermen for disturbing their tackle?—No, we manage our business amicably together. I have never heard a murmur all the time I have been at Grimsby.

16,202. Are your smacks on the ground the line fishermen frequent?—They frequently fish together.

16,203. There is no complaint on either side?—Not any.

16,204. Are your smacks at this time fishing on the same ground as the long-line fishermen?—I should imagine they are.

16,205. Whereabouts is that?—About 40 miles from the Humber.

16,206. Near the coast?—No, right off, about south-east.

16,207. Are there any French line-fishermen fishing at the same place?—Not any.

16,208. Are there any Dutchmen?—Occasionally a Dutchman comes here trawling or hooking off the Well Bank.

16,209. (*Mr. Caird.*) Do trawl fishermen some times change and go into the line-fishing, and do line-fishermen sometimes change and go into the trawl-fishing?—Sometimes, but not in our vessels. The well-vessels they can adapt to either purpose. Sometimes they can use them for trawling in the summer time on the Dogger Bank and the Well Bank. They keep the fish alive in the wells.

16,210. Is there any marked difference in the return

obtained upon the capital employed by trawl fishermen and line fishermen ; does the one get a larger return than the other ?—The line fishermen will draw more money than we do.

16,211. Do they make a larger profit on the capital they have invested?—I cannot say that.

16,212. Has there been a larger increase of trawlers than of line-fishing vessels ?—Yes.

16,213. If there is a larger increase of trawlers that would indicate that trawling is the more productive of the two ?—Perhaps it may.

16,214. What is your own opinion upon that point ? —I don't know the receipts of the cod smacks here, and therefore I cannot give an opinion.

16,215. You cannot say whether on the whole the capital employed in trawling is more productive than the capital employed in line-fishing ?—I should say that the one is equal to the other. I think the line fishermen are doing very well.

16,216. What is the number of the line-fishing vessels from Grimsby ?—About 42.

16,217. (*Mr. Lefevre.*) What is the number of trawlers ?—There are 70 sail of trawlers.

16,218. (*Mr. Caird.*) There is a much larger number of men in a line-boat than in a trawl-boat ?—Yes.

16,219. Then there will not be a greater number of men employed in trawling than in line-fishing altogether ?—They take 9 or 10 hands in a vessel engaged in line-fishing.

16,220. That would be about 400 fishermen altogether ?—Yes.

16,221. In your 70 vessels how many do you carry ? —Five hands in each.

16,222. That would be 350 altogether ?—Yes.

16,223. Then you have pretty nearly the same number in the different businesses ?—Yes.

16,224. (*Mr. Lefevre.*) Do you pay the men in the trawl boats the same as the line fishermen are paid ? No, we go by share.

16,225. How is that ?—The master takes a share and three-eighths, and the men take a share and one-eighth each. They divide by eight.

16,226. Are there four men besides the master ?— Yes, men and boys.

16,227. What does the owner get ?—He has what is left to find the vessel's gear, to pay the apprentices, and provide the apprentices' provisions.

16,228. Do you provision the ship ?—I provision for the whole ; but I deduct the provisions for the men from their shares when we divide with them.

16,229. How often do you divide ; do you divide at the end of each voyage ?—No, at the end of five or six weeks.

16,230. Are the men engaged by the year ?—No, by the voyage.

16,231. Is the captain engaged in that way too ?— We don't engage for any length of time at all. In fact we go on amicably as long as we can make everything agreeable.

The witness withdrew.

ALFRED BLAKE called and examined.

A. Blake.

16,232. (*Mr. Caird.*) You are engaged in the lobster fishery on the coast of Norway ?—Only for the last three seasons ; I am a line fisherman.

16,233. We desire to get some information in regard to the supply of lobsters from Norway ; you can give us it, can you not ?—Yes.

16,234. You have been engaged in that business ? —Yes ; it has been gradually on the decrease during the last three years.

16,235. Have you been engaged over in Norway ? —Yes.

16,236. What were you doing ?—Superintending a district.

16,237. Superintending the catching and shipping of lobsters to this country ?—Not the catching of them, only the shipping of them.

16,238. Have you been employed by a house on this side for that purpose ?—Yes.

16,239. Who employs you ?—The agents on this side.

16,240. What is your business ?—To superintend the shipping on that side. I superintend the vessels, and send them away weekly with the week's catch. The natives there catch the lobsters

16,241. In what part of Norway have you been engaged ?—In the Karmo district. I can give you the total quantity of lobsters sent away.

16,242. What is the number ?—154,854.

16,243. Was that number sent away last year ?— Yes.

16,244. That is the supply during the whole season of the particular locality under your inspection ?— Yes, in the course of three months.

16,245. Are there any other people employed in collecting them for this country ?—Not from that district. The lobsters are sent here by contract.

16,246. Are there other districts in Norway from which this country is supplied ?—Yes.

16,247. Comparing the last year's supply with the present, has it increased or diminished ?—It has diminished.

16,248. Has there been a great diminution ?— About 50,000.

16,249. What is the cause of that ; are the lobsters being over-fished ?—No, it depends upon the weather.

16,250. There may come as large a supply as there was last year ?—Yes, if there was a mild winter.

16,251. The deficiency does not at all result from over-fishing ?—No.

16,252. Is there any large proportion of all the lobsters that come into Grimsby supplied from Norway ?—All that come into Grimsby are supplied from Norway.

16,252*a*. Does that form a large portion of the supply to this country ?—Yes.

16,253. At what season do you get them ?—The season commences in April and concludes on the 12th of July.

16,254. Is that the only season that you fish for lobsters in Norway ?—They are not allowed to fish them at any other time.

16,255. Is the price of lobsters increasing or diminishing in Norway ?—Diminishing. Many companies have tried their hands at it, but they have been ruined. They will not give as much now as they did. They found that they could not get their returns in this country.

16,256. Has the price here increased or diminished ? —I don't know.

16,257. How many vessels have been engaged in bringing lobsters to this country during the season ?— Six.

16,258. (*Mr. Lefevre.*) Do they all come to Grimsby ?—No, to Harwich also.

16,259. Are not lobsters brought from Cromer and that district ?—I think not.

16,260. The trade in Norway has been rather overdone ; there have been too many employed there ?—It depends upon the weather.

16,261. I thought you said that some of the firms had been ruined there ?—Some of the firms in this country have been ruined by speculating.

16,262. By buying lobsters in too great quantities ? —No, but at too great a price.

16,263. (*Mr. Caird.*) How do they catch the lobsters ?—With coops.

16,264. In the same mode as they are caught on this coast ?—No.

16,265. What is the shape of the coop ?—It is a small barrel with a net at each end. Instead of having a head, the head is formed by a net.

16,266. It is open at each end ?—Yes, with a net across.

GREAT GRIMSBY.

A. Blake.

30 Nov. 1863.

16,267. Where do the lobsters go in?—A space is left in the centre, and the lobsters crawl in.

16,268. Do they catch a larger quantity than they do with the lobster pots in this country?—Yes, but the fish are very scarce occasionally, and the fishermen will not get more than 15 fish in a night out of 20 of these coops.

16,269. Do they bait the coop?—Yes, with fish.

16,270. Have you ever seen them used here?—No.

16,271. Do you think any advantage would arise from fishing with them here?—No, there is too much tide.

16,272. That would be an objection?—Yes.

16,273. Then the tide runs more here than there?—Yes.

16,274. (*Mr. Lefevre.*) What is the close time of the season in Norway?—It commences on the 12th of July.

16,275. And when does it conclude?—They begin fishing in April, and they go on from the 4th of April till the 12th of July.

The witness withdrew.

B. Bulpit.

BENJAMIN BULPIT called and examined.

16,276. (*Mr. Caird.*) Are you a line fisherman?—Yes.

16,277. Have you been long engaged in the line-fishing at Grimsby?—Six years at Grimsby.

16,278. Have you had many years' experience of line-fishing before that?—Yes, I have been at it altogether 34 years.

16,279. Have you always been engaged in line-fishing?—Line-fishing and trawling as well. Some parts of the season I have been line-fishing and some parts of it trawl-fishing; but during the last six years I have been engaged in nothing but line-fishing.

16,280. Long-line fishing?—Long-line and hand-line fishing.

16,281. Do you fish in both modes from the same vessel?—Yes.

16,282. In your experience, within the last 10 years, have you found that the quantity of fish you can catch is increasing or diminishing?—I think it is very much on the increase.

16,283. In the same vessel, with the same number of hands, and the same number of lines?—Yes.

16,284. Are your vessels larger than they used to be?—Ours is not. It is about 23 years of age. There are a few larger, but not many.

16,285. What is the size of your vessel?—64 tons old measurement.

16,286. Do you fish on the same fishing ground that you used to frequent in former years?—Yes, I have been fishing on these grounds for the last 26 years.

16,287. Have you found as many fish this last summer as you used to find before?—There have been more fish this summer than I have ever known during the whole of the 26 years.

16,288. More than during the whole of your experience?—Yes.

16,289. On the same grounds?—Yes.

16,290. Are these grounds frequented by trawlers?—Yes, the trawlers are a very little way from us; sometimes 10 and sometimes only 5 miles.

16,291. Yours is rougher ground than the trawlers frequent?—Yes.

16,292. But is it in the same banks and in the same locality that has for a long time been frequented by trawl-boats?—Yes.

16,293. Then you don't agree with those who say that the line-fishermen have suffered injury from the practice of trawl-fishing?—No; on the contrary, I think trawl-fishing does us good.

16,294. In what way?—The trawl as it goes over the ground disturbs it, and things come up so that the cods can follow and obtain good food.

16,295. The result is that you find a larger quantity of fish on the same ground than you did in former years?—Yes, during the last four or five years we have found the most that ever we found.

16,296. Then the supply of fish has been increasing for some years back?—Yes, during the last four or five years since the trawl-vessels took to trawling more constantly over these grounds we have found more codfish.

16,297. Do you frequent the grounds where the open boats practice line-fishing?—There is a time of the season when we are obliged to do so, but it only lasts for a month.

16,298. (*Mr. Lefevre.*) Whereabouts is that?—At Dimlington, off Flamborough Head.

16,299. (*Mr. Caird.*) Is that at Bridlington Bay?—Off Hornsea and Withernsea.

16,300. Do you come within the Head?—No, in sight of the Head, on ground more than 10 miles from the shore.

16,301. Do you get many fish there?—At times; there are more fish at one time than another. It depends upon the manner in which the fish set in after the sprats.

16,302. Are you aware that the open-boat fishermen who fish off the coast to which you refer complain that the quantity of fish they can take has very much fallen off?—I don't know. I don't believe it is on account of our vessels going there. We only go there when the gales of wind set in; we cannot go anywhere else. We go when the fish set in after the sprats.

16,303. Are their lines the same as yours?—Yes.

16,304. They catch the same kind of fish?—Yes.

16,305. But they cannot leave the shore when you leave it, and they find no fish can be caught there?—Yes, they often leave that shore; they fish where we do.

16,306. Do the open boats fish out in the distant deep sea?—Sometimes when the weather is fine; it is all according to the weather.

16,307. But you are able to continue at sea when they are obliged to come to land?—Yes.

16,308. You are able to continue fishing when they are obliged to run for the harbour?—Yes.

16,309. In that way are you able to catch fish in rough weather when the open boats are obliged to run for shelter?—Yes, I think we are.

16,310. Is there any particular fishing ground that in your experience has diminished in its yield of fish?—No, unless it is the Orkney Islands fishing. It seems to have fallen off along the Caithness coast, the Stack, Skyë, and other places.

16,311. Is there any on your own shore between Flamborough Head and the Thames that has diminished within your experience?—I don't think there is.

16,312. You cannot point out any particular ground that you would avoid going to, on which you used frequently to catch fish?—No, not one.

16,313. Have you been in the habit of going north to the Orkney Islands?—Yes.

16,314. How long have you been going there?—I have been going there for the last 32 years on and off.

16,315. When were you last there?—About two years ago.

16,316. Were you as successful as you had been in previous years?—We could not find anything at all.

16,317. In places that you were formerly successful in finding fish?—Yes.

16,318. There has been no trawling there?—I never saw a vessel with a trawl down in those parts.

16,319. What do you imagine is the cause that fish has fallen off there?—I can't say. I suppose it is the track of the herrings; they don't track there.

16,320. If you were told that it had arisen from over-fishing,—that the reason why the fish had diminished off the Orkney Islands was that they had been over-fished, do you believe that would be true?—No,

I should not. If those grounds have been over-fished then our grounds have been ten times more fished.

16,321. Is there any other part of the Scotch coast that is not as productive as it used to be?—No.

16,322. Have you ever fished on the grounds off Peterhead?—No; I have been more off the grounds here. I think I have frequented them more than any other man here.

16,323. Do you know the Knoll Bank?—Yes, Cromer Knoll.

16,324. Are the fish there as plentiful as they used to be?—Yes.

16,325. Are there as many vessels fishing there as there were in former years?—Yes.

16,326. Has the number of vessels fishing upon the grounds along the east coast of England, between Flamborough Head and the Thames, greatly increased within your experience?—Yes.

16,327 Do you think that every one of those vessels can catch as many fish each as the smaller number of vessels was in the habit of doing in your early times?—Yes, I think they do.

16,328. Do you ever fish on the Dutch coast?—I have not done so for the last six years. In former times I did. We used to go every season.

16,329. Was that in the summer time?—Yes, in the summer time.

16,330. English fishermen only go there in the summer time?—Yes, they commence in March or April.

16,331. Where do you get your bait?—There are boats that go up to the Deeps for it, and sometimes we get it at Saltfleet.

16,332. What kind of bait do you use?—Whelks.

16,333. Do you buy that bait?—Yes.

16,334. Are they brought here and put on beds?—No, they come up in bags. We take them up in bags and put them in our wells.

16,335. Are they not stored up in banks, so that you can have recourse to them when you want them?—No.

16,336. But you take them from the Deeps direct?—Yes.

16,337. Has the price of bait diminished or increased?—It is much about the same as it has been for the last 30 years.

16,338. Do you buy it by the bag?—No, by a measure that is called a "wash."

16,389. What is a "wash"?—Twenty-one quarts and a pint, that is a proper stamped wash.

16,340. It is about the same as a bushel?—It is not as much as a bushel. I think 21 quarts and a pint is what they call a wash.

16,341. Is a wash about three-fourths of a bushel?—Yes, as near as can be.

16,342. What supply do you require to take to sea with you when you go to fish in the long-line season?—We take 40 wash, and in the end of the line season, 15, 20, or 25 wash. We seldom take more than 25 wash in the end of the season.

16,343. Do they keep fresh in the well until you require them?—Yes, quite alive; they keep as well in warm as in cold weather.

16,344. Is it of importance that you should have a regular and constant supply of that bait?—Yes, it puts us much out if we can't get it.

16,345. Have you had any difficulty?—Yes, before I came to Grimsby I have been detained three weeks before I could get bait.

16,346. Was there no bait to be had in the Deeps?—I was fishing at Whitstable then. I have had no detention since I have been at Grimsby.

16,347. Does the bait all come from the Deeps?—Yes, from the Deeps and Saltfleet.

16,348. (*Mr. Lefevre.*) Do you mean Boston Deeps?—Yes, Boston and Lynn Deeps.

16,349. Do you use mussels?—No, I never use mussels.

16,350. Do you know whether any of the long-line fishermen use mussels for bait?—Not any of us here.

16,351-2. (*Mr. Caird.*) They use mussels very largely for bait in the north?—I have heard they do.

16,353. Have you ever tried them?—No, I never did. I never heard of anyone who did. I don't think mussels would stick on our hooks. Our vessels are under sail, and I think when the hooks were thrown overboard the mussels would fall off. It is not a hard enough substance to resist the action of the water when we throw the hooks overboard.

16,354. (*Mr. Lefevre.*) The mussel is better adapted for open-boat fishing?—Yes.

16,355. (*Mr. Caird.*) Why?—They can ease the oars and drop it overboard. We are generally under a press of sail, and the line goes out very fast, and as we chuck it overboard it would go off.

16,356. Your bait is a tougher description of fish?—Yes, the whelk is.

16,357. Has the price of fish to you, as fishermen, increased or diminished in recent times?—It is according to the weather; the average is about the same. Perhaps there may be heavier prices given for fish now than during the last 20 years, if the weather is unsuitable for vessels to catch fish.

16,358. Have you long been in the habit of putting your fish in boxes in the dock, keeping them fresh to suit the market?—Only since I have been at Grimsby.

16,359. Have you derived much advantage from that?—Yes, great advantage indeed.

16,360. Does it enable you to retain your fish so as not to overstock the market?—Just so.

16,361. You supply the market just as the market requires it?—If it were not for this I think Billingsgate market would be often without a codfish at all.

16,362. Is there any other place where that is done?—I believe they have store boats at Harwich and Gravesend.

16,363. Store boats?—Yes, not like ours, but vessels with large wells in them.

16,364. In which the live cods are taken out of the cod vessels and stored?—Yes.

16,365. Have they been long in use?—They have been in use at Gravesend for the last 15 or 16 years.

16,366. They have only been introduced here during the last five years?—Yes, the last five or six years.

16,367. Has that enabled you to get a better price for your fish on the whole?—It has at times.

16,368. If you had no means of storing them, you would not be able to make in the course of a year as good a price for your fish?—I think not.

16,369. Do you catch many haddocks?—Very few; only in the Dogger season, which commences now and lasts up to March or April. We catch a few on the Dogger Bank.

16,370. On the whole, which kind of fish pays you best as fishermen?—Codfish, haddock, and halibut. They pay us well if we get a good many of them.

16,371. Is there any kind of fish that has fallen off in quantity within your experience?—No, I think not.

16,372. You get the same proportion of fish that you used to get?—I think rather more.

16,373. More of all kinds of them?—Yes.

16,374. No particular kind has decreased in comparison with any other kind?—I don't think there has.

16,375. Do you think the quality is as good as it ever was?—Yes.

16,376. You get as fine haddocks as ever?—Yes.

16,377. Are the turbots as fine?—The halibuts are, but we don't go in for the halibuts much.

16,478. Where do you get the finest cod?—At Cromer Knoll in the season.

16,379. What is the best season for that?—It commences in November and lasts up till January or February.

16,380. (*Mr. Lefevre.*) What is the season for the hand-line fishing?—The season commences about July and lasts up to the latter part of October; that is what we call our hand-line season.

16,381. Whereabouts do you fish?—I have fished off here for the last 26 years.

16,382. What distance from the coast?—About 30

GREAT GRIMSBY.

B. Bulpit.

30 Nov. 1863.

miles from Spurn Point. In the latter part of the year the fish have been found in deeper water.

16,383. Then you begin with the long-line ?—Yes, in the latter part of October or the beginning of November.

16,384. Is any proportion of the fish you catch on the line injured by dog-fish or suckers ?—Yes, sometimes the dog-fish will eat the codfish.

16,385. What proportion do you lose in that way ?—In a set of lines we may have two or three scores, and 20 or 30 will be eaten up.

16,386. Is that a common thing ?—It is at times, but not frequently.

16,387. That would be about one half of the catch ?—I have seen quite half eaten.

16,388. Have you ever seen more than half ?—Yes by the "dogs."

16,389. Do you consider that extraordinary ?—They may be away from us for 12 months, and sometimes we have them among us two or three times running.

16,390. Do you ever lose any by the sucker ?—I never noticed that I did.

16,391. Do you find that the dog-fish take the fish you catch with the hand-line ?—No.

16,392. You take them up at once and don't lose any ?—Yes.

16,593. Your boats are now using the long-line ?—Yes.

16,394. Are they now fishing off Cromer ?—Some are off Cromer, and some on the Dogger Bank.

16,395. How many boats do you own ?— Only one.

16,396 Do you sail in it yourself ?—Now and then ; not always.

16,397. Do you find it makes a difference in your returns when you don't go yourself ?—I have been middling successful, even though I have not gone myself.

16,398. How long have you given up going yourself ?—I have not been for seven or eight months.

16,399. How long have you given up going regularly yourself ?—I have not been for the last five years.

16,400. Have you found on the whole that your profits have diminished ?—I don't see much difference in them.

16,401. What is the length of the long-line for use ?—The length of one line is 40 fathoms.

16,402. How many of these lines do you use ?—Sometimes we use 160 of these lines at a time.

16,403. Does it depend upon the length of the day ?—Yes, and what tide we are fishing in.

16,404. And in what water too ?—Yes.

16,405. Do you shoot across the tide ?—Yes.

16,406. When you fall in with trawlers do they ever cross your lines on the ground ?—Yes, I have been fishing and the trawlers going over my lines day after day and year afteryear for three or four years running. On all the grounds here the trawlers have been going over the lines regularly, but so long as they don't touch the buoys they don't hurt us at all.

16,407. Do they not catch the hooks ?—They may catch a hook and pull it off, but I don't know that I ever noticed it.

16,408. They never disturb the lines ?—No.

16,409. Then you don't think it can be true, as complained of elsewhere, that the line fishermen lose their lines in consequence of the trawlers going over them ?—No, I never found it so, and I have been with them plenty of times.

16,410. Have you ever lost a buoy by the trawlers ?—No, they try to avoid going over the buoys if they can. If they can't avoid going over the lines they try to clear the buoy, and then they never hurt the lines.

16,411. Are your boats bringing home great quantities of codfish just now ?—Not for a fortnight or three weeks, but before that they had good takes.

16,412. What is the regular supply to the London market from here ?—It varies a very great deal.

16,413. Have the tanks here been full of codfish lately ?—Yes, the chests have been full of codfish here for the last three weeks.

16,414. What do they hold ?—According to my calculation, there are now from 800 to 1,000 score of cod here.

16,415. Do these chests belong to the dock company ?—No, a man hires a chest.

16,416. What do you pay for them ?—One shilling each.

16,417. For how long a time ?—As long as we like to keep the codfish—until we want to send them to London.

16,418. Do you catch bigger cod at the Dogger Bank than at Cromer Knoll ?—At both places we get very fine cod ; they are just the cod we like.

16,419. Have you found of late years that the size of the codfish has been decreasing off Cromer ?—No, I think they are as fine as ever I saw ; I never saw finer.

16,420. Is there a large proportion of small cod brought in here ?—Very few from Cromer Knoll or the Dogger Bank.

16,421. Do you catch a large proportion of turbot with the long-line ?—Sometimes we may catch one or two, but not often.

16,422. Do you ever catch soles ?—We may catch one or two, but not frequently.

16,423. Do you think the dog-fish follow the haddock and cod in shoals ?—No ; I think the dog-fish have fallen off on our coast. I have not seen many of late years. At one time there used to be a great quantity about this coast.

16,424. Do you find that the herring nets at all interfere with you ?—At times they do, but our vessels are always under weigh and keep clear of them.

16,425. The long-lines ?—If we begin to shoot our lines before daylight we keep a good look out.

16,426. Do you shoot before daylight ?—If we have a nice fine morning we will shoot between 4 and 5 o'clock.

16,427. How long do you leave your lines down ?—We shoot about half-tide, and when the tide begins to slack then we begin to haul.

16,428. Do you sometimes get a second shoot in a day ?—Yes, sometimes.

16,429. Do you make most money when you send your boat out trawling, or when you send it out line-fishing ?—I make most from line-fishing.

16,430. Is it not a bad sign when dog-fish are rather scarce ?—It does not appear to be a bad sign on this coast. They have been scarce now for the last four or five years, and the smacks have had a good catch of cod every year.

16,431. You have not observed that there has been any comparison or falling off between the codfish and the dog-fish ?—No.

16,432. (*Mr. Caird.*) Have you practised both trawling and line-fishing ?—Yes, until the last six years.

16,433. Which pays best ?—I always found that line-fishing paid me best ; I liked it best.

The witness withdrew.

J. O. Hawke.

JOHN OLIVER HAWKE called and examined.

16,434. (*Mr. Caird.*) Do you manage Mr. Dalton's fishing boats ?—Yes, I do.

16,435. It was stated to us by Mr. Dalton at Hull, nearly two months ago that his line-vessels were a very, bad speculation ; from that time to this has it so continued, or has the produce of his vessels improved ?—They have improved lately.

16,436. Are they paying better now ?—A little.

16,437. (*Mr. Lefevre.*) Are they paying at all ?—I should say they are just about paying.

16,438. (*Mr. Caird.*) Then is he in better spirits now, and desirous of going on ?—I don't think he is if he could get out of it. He has unluckily got into a bad trade.

16,439. (*Mr. Lefevre.*) Do you manage his business?—Yes, and I have vessels of my own.

16,440. (*Mr. Caird.*) Are yours in the same business?—No, mine are trawlers.

16,441. His are line-vessels?—Yes, and I have line-vessels too.

16,442. Are your line-vessels as unremunerative as his?—They are the same; I am interested with him in the line-vessels, I am connected also with him in trawling, but I have trawlers of my own as well.

16,443. Which do you find pays best?—Trawlers.

16,444. Do they pay better for the capital invested?—Yes; they don't pay as much money but their expenses are less.

16,445. There is a larger nett balance?—Yes.

16,446. Do you find that trawl-fishing on the whole is a remunerative trade?—Yes.

16,447. You have not found the line-fishing to be a remunerative trade?—No.

16,448. Is there a prospect of its becoming a better trade?—I don't know; I have given up all hopes of it.

16,449. How long have you been engaged in it?—For three or four years.

16,450. Has it gone from bad to worse?—In 1859 the vessels paid very well, but they have got worse ever since.

16,451. Has the price diminished?—I don't think it has.

16,452. Has the quantity of fish diminished?—I think the quantity has diminished up to within the last two or three months or so, but I don't think that is any criterion for the fishing trade any more than a good harvest on land. It is due to exceptional causes. We have had such fine weather that immense quantities of fish have been caught off here this season.

16,453. Then am I to conclude from that that it is a question of weather; that if there has been any diminution at any time, it is not because there is not plenty of fish in the sea, but because you don't have favourable weather to catch them?—Yes.

16,454. You don't think that the supply of fish in the sea has decreased?—No.

16,455. Do you know of any banks or fishing grounds that are less productive than they used to be?—I believe the Dogger Bank is less productive in haddock than it was a few years ago. I find that our vessels don't bring in so many haddocks as they did in 1859, 1860, and 1861.

16,456. That is on the Dogger Bank?—Yes.

16,457. You are referring now to haddocks alone?—Yes.

16,458. You find the other kinds of fish quite as numerous?—Yes.

16,459 And as fine in quality?—Yes.

16,460. Of late, during the last two or three months, have you found the same decrease in haddocks?—They have only just begun to fish the Dogger Bank. Two or three vessels have gone from here, but they have brought but very few haddocks in with them. Although I am interested in the fishing I must be allowed to say that I think there is a great quantity of small cod or codlings brought into this dock which ought not to be brought. There have been some scores of thousands brought in all through this season. I am no practical fisherman, but I have seen them brought in by our vessels and by others too. I find sometimes that a vessel will bring from 30 to 60 score of these codlings, about 15 inches long, or even less. I am told they are caught off Dimlington, close to the land.

16,461. By your line-vessels?—Yes.

16,462. What distance from the land may that be?—Close to it; but I can't tell you exactly; I am no practical fisherman.

16,463. Is that in Dimlington Bay?—Yes.

16,464. On the Yorkshire coast?—Yes; off Spurn Point.

16,465. You have not been in the vessels fishing?—No; but I have seen the fish brought in.

16,466. Do you know that they are caught close in-shore?—Yes; some of them in Boston Deeps. They have been fishing there for the last few weeks, in 3 or 4 fathoms of water, and have been bringing in large quantities of small cod, from 12 to 18 inches long. I think they ought not to be caught and brought in by us or by any other cod smacks.

16,467. Do you think they are immature fish?—They are; they must be.

16,468. Do they bring a good price in the market?—I don't think they fetch 4*s.* or 5*s.* a score, and sometimes we can't sell them for more than 3*s.* a score.

16,469. What do they bring per pound weight compared with what they would bring if they were allowed to become mature fish?—I can scarcely answer that question. I have seen them brought in, some of them less than 12 inches long.

16,470. They are all caught in shoal water, close in-shore?—Yes.

16,471. By the long-lines?—Yes, by the cod smacks. We reckon, from the Dogger Bank, eight or nine score of codfish a good catch; but these smacks are bringing in from 30 to 40, 50, and 60 score of cod from off Dimlington and Boston Deeps. They must necessarily be immature fish.

16,472. Would those nine score from the Dogger Bank bring as much money as the 50 or 60 score which are caught close in-shore?—Ten times as much, I should think. Nine score would fetch at least six or seven times as much as 50 or 60 score of small fish.

16,473. Would it take a much longer time to make a voyage to the Dogger than to make the other voyage?—Yes, it would.

16,474. How much longer?—If there is a fair wind they are only a few hours in running to the Dogger Bank from here.

16,475. Then would not a fisherman stand much in his own light if he went to a place where he could only bring in a catch of fish worth a sixth-part of what he could bring in if he went to the Dogger?—The Dogger Bank fishing has only just commenced. If he had gone there a month or six weeks ago he would not have found any fish. They fish in-shore, because no fish are to be got on the bank. The bank-fishing is commencing now.

16,476. Is there any other place where they can go to fish?—They have been fishing during the last month in Boston Deeps.

16,477. That fishing is also in-shore?—Yes, in shoal water.

16,478. Is there any deep-sea fishing that may be got at the same time?—I am not aware of any. These small fish are after the sprats, close in shore, I believe.

16,479. Fishermen go to the ground where they believe they will catch those fish.—Yes.

16,480. They could not at the same time catch anything else?—I don't know that; there are practical fishermen here who can give you that information best.

16,481. They have been in the habit of doing that for many years?—Since I have been connected with them they have.

16,482. Has the take of full grown cod diminished in consequence?—I have not noticed that it has.

16,483. You have not observed any falling off in the quantity of full grown fish in consequence of these small cod being taken?—No.

16,484. Then what do you complain of?—I think it is a great shame that so large a quantity of fish should be brought to market, fetching almost no money.

16,485. (*Mr. Lefevre.*) Why?—It seems a pity to kill such things.

16,486. (*Mr. Caird.*) Would any other fish be brought in at the same time?—The larger fish must be somewhere.

16,487. You are not a practical fisherman yourself?—I am not.

16,488. You don't go to sea at all with your vessels?—No.

16,489. You can only speak of what comes ashore?—Yes.

16,490. You don't know where the fish are caught?

GREAT GRIMSBY.

J. O. Hawke.

30 Nov. 1863.

—Only what the captains told me. They told me that they got close in-shore at Dimlington, in three or four fathoms of water, and at Boston Deeps.

16,491. Is that only during the month of November ?—In October and November.

16,492. Then after November no more of these little fish are caught ?—No ; then they begin to go to the Dogger Bank and Cromer Knoll and bring in large fish.

16,493. (*Mr. Lefevre.*) Do you think it would be advantageous to you as the owner of fishing smacks if the State interfered to prevent the catch of small cod ?—I think perhaps it might. The fishermen would then probably find out other grounds where they could catch larger fish.

16,494. Do you ever instruct your captains to go further off ?—I have told them that I was ashamed of what they brought in and that I would rather they had kept out than come in at all. I have told them that I would prefer that they would bring no fish rather than those they have brought.

16,495. Do you find that you only get a small price for such fish ?—We must have something to meet the expenses and therefore we put up with it.

16,496. How many vessels are you interested in ?—I have the management of, and am interested in seven altogether.

16,497. How many of these are Mr. Dalton's ?—Five ; the five are not solely and wholly his.

16,498. You have no interest in these five ?—Yes.

16,499. As owner ?—Yes, as owner.

16,500. You have two of your own besides ?—Yes.

16,501. How long have you had them ?—For two years.

16,502. Have you found that you have been losing money at the same rate as Mr. Dalton ?—I don't say that I have. The vessels that I have of my own are trawlers.

16,503. They are not line-boats at all ?—No, I don't want any line-boats.

16,504. Does Mr. Dalton assist you in looking after his boats ?—No.

16,505. He leaves it entirely to you ?—Yes.

16,506. Do you agree with him that he has been losing money during the last five years at the rate of 200*l.* a year ?—No, that is a mistake. Mr. Dalton did not explain that properly ; he has not lost 200*l.*

16,507. Was what he meant to say that in one year he had lost 200*l.* ?—No, he had a vessel that lost upwards of 300*l.* in hard cash without allowing anything for interest.

16,508. Is there any mode of accounting for that ?—I am not a practical man ; I cannot do so.

16,509. Do you think he did not tell us of other years, wherein he made up that loss ?—No, last year one of our vessels lost upwards of 400*l.* in hard cash without allowing anything for depreciation or interest on the capital.

16,510. You don't agree with him when he says : "I have lost 200*l.* per annum on each of my boats" ?—Yes, I do.

16,511. Then how do you explain it ?—We offered one of our vessels for sale——

16,512. I am not talking about vessels being sold, but of what has been the result of the trade for the last few years. He tells us "I have lost 200*l.* per annum on each of my boats" ?—Yes.

16,513. Do you agree with that ?—No, this is how the case stands. Supposing I had a boat for three years, that would be 600*l.* If it was brought into the market now, it would not fetch 500*l.* and yet it would have cost 1,000*l.* The interest on this amounts to about 150*l.* and then the vessel only selling for 500*l.* makes a still greater loss. Taking all our vessels together it really amounts to that.

16,514. Then you think the words "I have lost "200*l.* per annum on each of my boats" includes the amount of the depreciation on the boat as well ?—Yes.

16,515. It does not refer to his gains and losses alone during that time ?—No.

16,516. During the five years he may have been making large gains ?—I think not ; I should be glad to show you our books.

16,517. Can you give us a return of the losses and profits during the last five years ?—I can hardly do that ; but I can show you our books.

15,518. We shall be quite satisfied if you give us a list showing your losses on each boat during the last five years—can you give us such a return ?—Yes.

15,519. Is it your opinion that the loss has been general with all the owners of line-smacks ?—No ; there are always exceptions. The last witness, Mr. Bulpit, would not have had his expenses if his vessel were like the one upon which I told you we lost 400*l.* last year. Where that vessel has gained 380*l.* his vessel has made three times that amount.

16,520. Do you think his case is exceptional ?—There are two men, who are sitting there, and they make double the money of any other cod men in the place.

16,521. How do you account for that ?—I don't know how to account for it, but it is a well-known fact. They are always together and what the one gets the other gets.

16,522. Perhaps it is due to their being more experienced ?—They don't always go to sea themselves, but I will guarantee that their two boats make as much money as any other three, or taking the worst, as any other four or five out of this place.

16,523. Do you think that the line-boats generally have been losing money ?—You see they don't look at it in a proper light when they say they have been making money. For instance, if they take up 30*l.* and make 30*l.* then they say they clear themselves. They don't take into consideration the loss of interest upon their capital, and the depreciation of property.

16,524. But you with your better knowledge think that the line-boats have been losing money ?—I should say that they have.

16,525. Notwithstanding that they have been increasing in number ?—I don't think the cod smacks have been increasing in number lately.

16,526. Have your vessels been lying in the dock ?—Yes, the one is lying in the dock that made only 384*l.* from September up to the 3d of March in the height of the season. It laid by here from the 3d of March until the 28th of June and then we sent her away to Iceland. The one that lay alongside of her was laid up in April, and we sent her to sea in the beginning of September.

16,527. Do you find it answer best to leave them in the dock rather than send them to sea ?—Yes, I do.

16,528. (*Mr. Caird.*) As I understand you, you speak in a complaining tone of the result of your fishing altogether—do you imagine that any remedy of any kind can be applied to save you from the loss of which you complain ?—I think if a stop were put to this in-shore fishing by which they bring in immense quantities of small fish that are not worth the expense of catching, that some benefit would accrue to us.

16,529. You have referred to two gentlemen here who practise the same description of fishing that you do. They go to sea when your vessels lie in the dock, and they find it a paying and remunerative trade, while you find it a losing one. They have the same difficulties to contend with in the catching of immature cod, and yet they find it answers. What do you expect the legislature can do for you when these gentlemen can go on fishing and realizing a profit ?—But they are altogether an exception ; they have nearly the whole of the line-fishing to themselves in the summer. They don't go to Iceland, but they fish off here. They go in their own vessels and they have apprentice lads on board, and they can work their vessels cheaper than we can do. If they had two or three vessels competing with them they would soon have to shut up.

16,530. There is nothing to prevent your competing with them?—No, but although it will pay their boats to fish off here in the summer, if there were four or five they would be losing money. They began it when they first came here and no one else tries it.

16,531. (*Mr. Lefevre.*) I thought you said your men had been bringing home these small cods as well as the other fishermen?—Yes.

16,532. Do they not pay for the catching?—No, they scarcely meet the expense.

16,533. Then why do you send the vessels out?—Because they say there is nowhere else to go, and of course I don't know whether there is not.

16,534. (*Mr. Caird.*) Is there an immense quantity of these small cod brought to market?—Yes, immense.

16,535. Is the price very much lower than for other fish?—A score of good cod would be worth as much as 20 score of those small cod.

16,536. What would be the difference in weight between a score of good cod, and twenty score of small cod?—I don't know. About 12 score of Dogger cod would fill a van, but it would take between 50 and 60 score of these small fish. The small cod sell for about a sixth of the price of large cod.

16,537. During the time these small cod are coming to market there is no great supply of the finer description of cod?—No, there are very few then.

16,538. If the small cod were not brought to market there would at that time be rather a scarcity of fish of that description?—There would be none at all, but when they are catching the small ones they sometimes hook a fine fish among them.

16,539. Do these small cods go into the large consuming markets of the country?—Yes; a great deal is sent to London.

16,540. Does any of it go inland to Manchester, Birmingham, and such places?—Yes, it goes to all those markets.

16,541. Is there a large quantity of it got?—Yes, an immense quantity.

16,542. I presume it goes for consumption among the poorer classes of people?—Yes.

16,543. So that there is a large supply of food sent at that time into the consuming districts to the poorer people?—Yes.

16,544. You have not observed that the result of that has been to diminish the supply of large cod?—No, I have not.

The witness withdrew.

JOHN STARLING called and examined.

J. Starling.

16,545. (*Mr. Caird.*) You are a line fisherman, I believe?—Yes.

16,546. And a successful one?—Yes, I am happy to say that I am.

16,547. What do you attribute your greater success to, as compared with that of the last witness, who seems to have found it rather a bad business?—I cannot say; all I know is that I have found it a good business.

16,548. Do you take any other mode of fishing than he does?—Not that I am aware of; but I do not know how his captains manage it.

16,549. Do you go upon the same fishing grounds which they frequent?—We are supposed to fish all upon one principle.

16,550. Do you catch more fish?—Yes, I think I do.

16,551. Do you go on the same fishing grounds?—Yes.

16,552. Do you think that your business is better managed?—We all manage our own business; we have no large establishments to keep up, or anything of that sort, which runs away with a great deal of money.

16,553. Do you think that each of your vessels bring more fish to land?—Well, I do not know; but I think we do on the average, taking the year through.

16,554. Have you noticed whether on the fishing grounds you have frequented successively year after year, the quantity of fish you can catch has increased or diminished?—I have been down here at Grimsby now for nearly five years—five years come next month—and the quantity of fish I have been enabled to bring to shore has been on the increase with me ever since I have been down here. I think on the whole that the quantity of fish in the sea has increased.

16,555. Between what points do you usually fish along the coast north and south? Do you go as far north as Flamborough Head?—Very seldom; but we went down this last summer as far as the Berwick Bank.

16,556. Is that off Berwick?—Yes.

16,557. Is it a good fishing bank?—Yes, there are always plenty of fish there, except when the herrings are passing; they float from it then, but they return again.

16,558. What kind of fish do you get there?—Cod.

16,559. What season do you go there?—We went there last July.

16,560. At this season of the year where do you fish?—I have been fishing about here from five to forty miles off this coast for the last two months.

16,561. Have you frequently seen the trawl-fishermen near the grounds upon which you fish?—Yes.

16,562. Do you not complain of the injury they do you; or is it the fact that they do you no injury at all?—We don't think they do us any injury, and it almost seems a miracle that they should be able to pass over our lines without hurting us; yet, nevertheless, it is a fact that they do not injure us.

16,563. They go over your lines without hurting you?—Yes.

16,564. Are you of opinion that the mode of fishing which has been practised by the fishermen here has not tended to decrease the supply of fish?—No, I think not.

16,565. It has not decreased the supply of fish of any kind?—No, I think not.

16,566. In reference to the small cod of which the last witness spoke, is there a large take of those small cod in the season?—Yes, there are a great number taken every season. Every year is alike in that respect.

16,567. When does it come?—About the middle of October.

16,568. And until when do you continue to catch it?—Until about the end of November.

16,569. Then does it come just in the sprat season?—Yes, the sprats all set in along the shore at that time, and the cods come in after them.

16,570. Do the large cod not follow them as well as the small cod?—Yes, there are large cod among them.

16,571. You get large and small cod together?—Yes.

16,572. In what proportion?—If we get 40 score of cod there will perhaps be five or six score of good cod among them.

16,573. Do you get a larger proportion of small cod when you come in-shore than if you remain out, fishing in deep water?—We are generally 10 miles from the shore when we catch the small cod.

16,574. Where do you catch them?—Off Dimlington.

16,575. Dimlington Bay?—Yes, except it happens to be blowing a very heavy gale, and then we may, perhaps, come a little nearer in.

16,576. Do you catch a larger proportion of small cod then than at any other season of the year?—Yes; the cod seem to hang about there; but there are places off the Dowsings, where we also get them in considerable quantities.

16,577. Where are the Dowsings?—About 40 miles from here; the fish we get there are as small a

GREAT GRIMSBY.

J. Starling.

30 Nov. 1863.

fish as we get at Dimlington. We frequently catch them just as small, but it is only in the season from October to December that we catch these small fish.

16,578. You only get them from October to December ?—Only in that season along the shore ; we do not fish along the shore at any other time except that. That is the only time of year that we do fish along the shore.

16,579. Is there a large proportion of all your catch at that time of year of that description, namely, small cod ?—Yes.

16,580. Is there as much as one half small cod ?—Yes.

16,581. Is there more than half ?—Sometimes.

16,582. Much more than half ?—There will be all one half, and sometimes more than one half small.

16,583. Do you realize much as a fisherman from these small cod ; do they pay you well ?—Yes.

16,584. Are they not very cheap ?—Yes ; they do not pay according to the value of larger cod, but there is a great quantity of them, and we reckon that the quantity pays, although it is sold at a cheaper rate. It does not matter much to me if I make 50*l.* in a week, whether I make it by small cod, or by large.

16,585. I suppose you mean if it occupies about the same time to catch them ?—Yes, that is just it.

16,586. I imagine that these small cod form a very cheap food for the people ?—Yes, very cheap at times.

16,587. Much cheaper than the bigger cod ?—Yes. I think it is a grand thing for England that they are caught. They fill a good many mouths when it would be difficult to obtain other food. There is not a question about that.

16,588. Have you found that that description of fish has been caught at that particular season for many years ?—Yes, ever since I can recollect the fishing.

16,589. Has the same abundance of small cod been found this year at the same season ?—Yes, I think there has been rather more this year.

16,590. There has been rather more fish of every kind, has there not ?—Yes, there seems to be a very good supply. There are as many now at Cromer Knoll as ever I knew in the course of my whole experience.

16,591. Do you mean that there is as large a supply of good cod at Cromer Knoll as you ever experienced ?—Yes.

16,592. Then you do not find that the fact of your catching these small cod has at all injured the supply of large cod ?—No, not in the least.

16,593. You do not believe in anything of that kind ?—No, we have no reason to believe so, because we have found more fish every year.

16,594. How many years have you been engaged as a line-fisherman ?—Twenty-four.

16,595. Have you found that trawling has been injurious to your interests as a line-fisherman ?—No, but although I have been a line-fisherman for 24 years, I have been trawling between the seasons. I was first apprenticed to the lining business.

16,596. In your experience as a line-fishermen over a considerable number of years, have you found that trawl-fishing has been at all injurious to your business as a line-fisherman ?—I think not.

16,597. Do you think that the two modes of fishing can go on together without the one injuring the other ?—Yes.

16,598. The quantity of fish you have been enabled to catch year by year has not at all diminished ?—I think not ; on the contrary, there seems to be more fish now than there ever was.

16,599. (*Mr. Lefevre.*) At what distance from the coast do you generally find the small cod of which you have been speaking ?—What distance ?

16,600. Yes.—Well, perhaps three miles. No doubt we should find them closer in-shore, but we do not like to fish too near, because we generally find that the fish run very small the closer we get in.

16,601. The nearer you fish to the shore, the smaller, as a general rule, you find the fish ?—Yes, and for that reason we do not care about going too near the shore. We generally fish about five miles off the land, so that we can go into any depth of water.

16,602. Do you catch the small cod with the long-line or with the hand-line ?—With the long-line.

16,603. As the year goes on, do the fish go into deep water ?—Yes. For instance, in our hand-line season, before the sprats come, these small fish are numerous 30 or 40 miles off ; but when the sprats come in they leave the grounds 30 or 40 miles off and come along shore.

16,604. When the sprat-fishing is over do they go out again to sea ?—Yes, they have gone now. There are no fish there now. I had a vessel fishing there last week, and it came in with a very small lot. They are all gone ; they always leave at this time.

16,605. If you did not catch them in-shore in this way, do you think that later in the year you would catch them out at sea ?—No, I think they spread ; they spread all over everywhere.

16,606. Do you go out yourself in your smack ?—Yes, but I have a rest now and then.

16,607. Do you own more than one smack ?—No.

16,608. Do you think that the business is managed more profitably when the owner goes out with his smack himself ?—I think so.

16,609. Do you think that that accounts for the last witness having found it an unprofitable business ?—I think there is a little in that. We understand the nature of the business and know all that is wanted. Perhaps the captain on one of the smacks will come to Mr. Hawke and say, "We want so-and-so," and he does not know whether they do want it or not, because he does not understand the business.

16,610. Is there a large proportion of line-smacks here owned by men who go out themselves in them ?—Most of them.

16,611. And the trawlers too ?—Yes, some go in their own smacks, and there are some who do not.

16,612. Do you know how many men there are who go out as captains of their own smacks ?—I cannot say ; perhaps there may be a dozen or 15 out of this place.

16,613. Not more ?—No, I think not. I am speaking now of the cod vessels.

16,614. How many go out as captains of their own trawl-vessels ?—I do not know anything about them.

16,615. Do you find that you lose any large proportion of your fish by the dog-fish ?—No, I have scarcely ever lost any, except upon one occasion, about three years ago. It was in the spring of the year. I shot my lines and we had six and a half score of cod on the shank of the lines, and all we got alive was six.

16,616. But that was an exceptional case ?—Yes. When I came in I hung them about the ratlines. It was a great curiosity, the rigging appeared to be covered all over with skeletons.

16,617. Had they left all the bones ?—Yes, but the eyes were all out, and also the cheeks.

16,618. As a general rule you do not lose many fish by the dog-fish ?—When the herrings are about we do now and then, particularly between Cromer Knoll and Cromer.

16,619. What proportion do you lose on an average ?—Some days we never lose one. We can only tell when we begin to haul in because the fish are still on the hook. Perhaps some days we may have a score or so taken, perhaps not more than three or four ; we never take any particular notice.

16,620. Do you think the dog-fish feed on the cod ?—I think a dog-fish is not particular what he feeds on.

16,621. Do they pursue the codfish in the water ?—Yes, the cod is fast to the hook and they can manage him.

16,622. Do they pursue the codfish when they are not fast to the hook ?—I think not.

16,623. Do they feed on young cod ?—I should think they feed on all sorts of young fish, and herring spawn, and everything like that.

16,624. Have you seen young cod eaten by other

fish?—Yes, you may frequently see young cod inside the large cod.

16,625. They feed upon one another?—Yes.

16,626. Then I suppose that a large proportion of the young cod fall victims?—Yes, it is the same with them as with all other kinds of young fish.

16,627. (*Mr. Caird.*) In fishing do you ever find yourself working on the same ground as the foreign fishermen; do you ever have the Dutch or the French fishermen fishing with you?—Only on the Dogger Bank. The Dutch vessels are there.

16,628. Are they line fishermen?—Yes.

17,629. Do they not interfere with you in any way?—No.

16,630. Have you ever fished on the Dutch coast?—I have only been trawling; I was never lining there.

16,631. You never go lining on the Dutch coast?—No.

16,632. (*Mr. Lefevre.*) How do you work the hand-lines?—We have one line to each hand, and 10 hands in all on board a line-fishing boat. During the latter part of the day, about sunset, we have all hands on deck, as we reckon that that is the time of day when we can catch the most fish. During the early part of the day it is not necessary to have all hands on deck, and only part of them are engaged in working the hand-lines.

The witness withdrew.

THOMAS NEWBY called and examined.

T. Newby.

16,633. (*Mr. Caird.*) Have you been long resident here at Grimsby?—Yes, all my life.

16,634. Have you had a good opportunity of ascertaining the condition of the fishing interest?—No landsman here has had a greater opportunity than I have had.

16,635. At what time did it become of interest and importance?—About the year 1853.

16,636. Was that after the railway opened?—Yes, the year after.

16,636. Has it gone on progressively increasing since that time?—It has gone on steadily increasing since that time.

16,637. Both in the number of fishermen and in the number of vessels engaged?—Yes.

16,638. Has there been a pause in that steady increase?—None whatever.

16,639. Have many strangers from a distance come here and entered the business?—Very many. In point of fact it has caused one part of the town to be built—the part in which I reside.

16,640. Has the increase been nearly equally divided between trawl fishermen and line fishermen?—I think, speaking from memory, that about the year 1859 there was what I may call the greatest flush we have ever had. There was a quarrel about that time in Hull between the owners and the men, and some of them migrated here. One gentleman, Mr. Vivian, brought five smacks at one time, and there were other vessels which also came here.

16,641. Have you observed whether of recent years the supply of fish brought to Grimsby has much increased?—Yes.

16,642. Has the supply of all kinds of fish increased?—Yes.

16,643. Do you know whether the long-line fishermen or the trawl fishermen bring the largest supply?—I should imagine the trawl fishermen from what I have seen, but we do not often see the result of the cod men's voyages. They put their fish in chests and keep them in wells.

16,644. Do they supply the market with fish from those chests as the market can afford to take it?—Yes.

16,645. The trawl fishermen send their fish to market at once?—Yes. The only way in which we ever get cheap fish in Grimsby is when there is what they call "lost market" fish.

16,646. If they lose the market do they sell the fish here?—Yes, they sell it here then.

16,647. Is there a large quantity of that fish sold here?—Since we have had so many fishing boats here we have had less fish for domestic purposes than we ever had formerly.

16,648. Is that because most of it is sent away inland?—Yes.

16,649. Has the condition of the fishermen themselves improved?—Yes, all who like are making money.

16,650. It is a prosperous trade?—It is a prosperous trade for those who work at it themselves—those who understand it and manage it themselves. But I think if a man wants to sink money the best thing he can do is to go into the fishing trade if he does not understand it. He will very soon in that case accomplish his object.

16,651. Then you think it is a trade that cannot be conducted profitably unless accompanied by personal knowledge and personal supervision?—I am satisfied of that.

16,652. Have the most successful persons engaged in the business been persons who have themselves gone to sea in their boats?—Yes, they have either gone to sea or have attended to the business on shore. They have looked after everything the vessel has required.

16,553. And they have been practically acquainted with all the requirements of the business?—Yes, I think that has been the secret of their success.

16,654. Has the price of fish increased of late years?—From what I know, having had many income-tax papers to make out for these gentlemen, I think the price has increased.

16,655. What have the income-tax papers to do with it?—They make their returns, and I know what they make from year to year.

16,656. Have the profits of the fishermen increased as shown by those papers?—With some the profits have increased considerably, but there are some who have not made much way.

16,657. Speaking of the price of fish as supplied to the consumer, are you aware whether it has increased or diminished?—It has increased considerably.

16,658. The price of all kinds of fish?—Yes, I know very well that when I was a boy we never thought of giving more than 1*s.* 6*d.* for a very large codfish here.

16,659-60. Do you know whether that is the case in the manufacturing districts where they buy your fish?—No, I think not.

16,661. Probably when you buy fish here they get very little there?—Probably none. Speaking of my own knowledge, I am able to say that the fishing trade has been of very great importance to Grimsby.

16,662. (*Mr. Lefevre.*) Is that due to the increased demand, and to the fact that the railroads are able to take the fish inland, or to an increase in the supply?—I think it is owing to their being more locomotive facilities.

16,663. Do many of the owners of the fishing smacks return something under the income tax?—Yes, most of them pay income tax.

16,664. Then your observation does not show that it is a losing concern?—No; and having it under my eyes every day, I am enabled to see whether it is a losing concern or not.

16,665. There are not many instances of men losing 200*l.* a year by a vessel?—Certainly not. If ever a case of that kind happens it arises from non-practical men engaging in the business; such non-practical men would be pretty sure to lose.

16,666. Can you form any notion of what a man can get out of one smack in the course of a year?—He ought to be able to clear his 100*l.* a year.

16,667. Profit after paying all expenses?—Yes.

16,668. And after paying for the depreciation of

GREAT GRIMSBY.

T. Newby.

30 Nov. 1863.

the vessel?—Yes, if he is fortunate. There is one gentleman who has lost two smacks since he has been at Grimsby, but that is an exceptional case. I should say altogether that each vessel will make 100*l.* a year.

16,669. Are you speaking now of cod smacks or of trawlers?—Of trawlers.

16,670. Do the cod smacks make more?—Yes.

16,671. They are larger vessels, I believe?—Yes, and they turn over a great deal more money.

16,672. (*Mr. Caird.*) I think I understood you to say that the condition of the poor in Grimsby has very much improved?—It has.

16,673. In what way has the fishing produced that effect?—I will give you an instance. As I came down here I met a man who I know has a dozen olive branches around his table, and who, although a hard working man has great difficulty in getting a living for himself and those dependent upon him.

16,674. Is he a labourer?—Yes. This morning I saw him with a great bundle of offal fish, plaice, in his hand, which I knew he must have had given to him. By this means a great many of the poor in Grimsby get a dinner when they would otherwise have none.

16,675. But that is from the kindness of the fishermen?—Yes, it is from kindness, no doubt; but yet that is what has been complained of by the Northumberland men as waste fish. In point of fact what they complain of goes to feed the poor.

The witness withdrew.

T. Campbell.

THOMAS CAMPBELL called and examined.

16,676. (*Mr. Caird.*) I believe you are a buyer of oysters and shell-fish?—Yes.

16,677. Where are the oysters got here?—We catch them at different places. Some are got six or seven miles from the Spurn Point, at a place called Saltfleet.

16,678. Are there oyster beds there?—Yes, it is all an oystery bottom, a kind of stony bottom.

16,679. Do you cultivate them?—No; that is only the ground from which we take them.

16,680. Is it ground upon which you have placed oysters for the purpose of breeding them?—No, they breed on their own ground.

16,681. Then they are natural oyster beds?—Yes.

16,682. Are they the property of the public?—Yes.

16,683. Can anybody go and fish there?—Yes.

16,684. Without any hindrance at all?—Yes.

16,685. No amount of money is taken for the privilege of fishing there?—No, it is in the open sea.

16,686. Has it long been frequented for oysters?—Yes.

16,687. Do they yield as well now as they did in former years?—Yes, they do generally.

16,688. Does the yield vary in different seasons?—Yes.

16,689. Are the beds closely dredged?—Yes, very closely. They are dredged by smacks from Colchester, Rochester, and other places in the summer season.

16,690. Are they more closely dredged now than they used to be?—Yes, I think they are. There are more vessels that go there now.

16,691. And still they continue to yield a great quantity of oysters?—Yes.

16,692. There has been no falling off?—No, I do not think there has been.

16,693. Does the quality of the oysters continue much the same?—Yes.

16,694. Are they not becoming smaller?—No; it appears to me that they breed there almost every year.

16,695. You think that what may be taken away this year will be supplied in abundance next year?—Perhaps not in very great abundance, but there will be just as much as will enable the men to live by catching them.

16,696. Is there a large quantity taken here?—A good many in the summer season.

16,697. When they are taken by the Colchester men in the summer season are they taken to be laid down again on the Colchester beds?—Yes, the small ones are.

16,698. What do they do with the large ones?—They are brought here and sold in the market.

16,699. Is there any close time—any time during which they are forbidden to fish?—Not here.

16,700. Do they fish all the year round?—Yes, all the year round.

16,701. Is that not found to exhaust the beds?—I never saw any difference.

16,702. What quantity is there taken in a year off those beds?—I have no idea.

16,703. Is there any particular difficulty in fishing the oysters?—No, if the weather permits. You can only fish them in fine weather.

16,704. Would it not be possible to run so many dredges over them that they would be cleared off altogether?—No, there are too many stones.

16,705. There is always shelter for them?—Yes.

16,706. Do the dredges not take up the stones?—Yes, but they are glad to get rid of them again.

16,707. Do they pitch them back again?—Yes, directly they bring them up.

16,708. Are they loose stones or rocks?—Loose stones; they vary from 2 or 3 stone to half a pound in weight.

16,709. Is there any other kind of shell-fish caught on those beds?—No; except a few whelks.

16,710. Do they get whelks there for bait?—Yes.

16,711. Are they regularly fished for as bait?—Yes, in the summer season: at least, it is rarely that they fish there now, generally they go further southward for whelks for bait.

16,712. Are there any other oyster beds than those you have mentioned?—Yes.

16,713. Are they at Cleethorpe?—The oyster beds at Cleethorpe are private property. They bring the oysters from the beds in the sea and lay them on the beds at Cleethorpe to grow; they take the small ones that are not fit for the market.

16,714. Who do the beds at Cleethorpe belong to?—To the inhabitants there; they hire them.

16,715. Do they fish them under any restrictions?—No.

16,716. Do they fish them at all seasons?—Yes.

16,717. All the year round?—Yes.

16,718. Then the small ones may be taken up as soon as they are put down?—They would take them up if they could dispose of them, but they keep them until they grow larger. The longer they keep them the more money they can realize from them.

16,719. Do the Cleethorpe beds continue as productive as ever?—Yes, I think they are better than ever they were.

16,720. Why are they better?—Since the docks have been made the same amount of tide and surf does not run over them. They are partly sheltered.

16,721. It has become a better breeding ground?—Yes; the docks project further into the Humber and shelter them.

16,722. Can anybody who likes go there to fish them?—No.

16,723. Nobody except Cleethorpe people?—No. The beds are dry at low water, and then they pick them up.

16,724. With their hands?—Yes. The ground is all staked out.

16,725. Do they select the oysters?—Yes.

16,726. (*Mr. Lefevre.*) Do the oysters breed there?—No, they only grow; that is all.

16,727. (*Mr. Caird.*) Is a large quantity taken from there every year?—Yes.

16,728. Have you any idea what the quantity is?—No; it varies very much.

16,729. Do they send the oysters to market by railway?—Yes.

16,730. Then could we not ascertain the quantity from the railway officials?—I think not. They bring them here and send the weight of them by the railway from the docks.

16,731. Are there any other oyster beds there than the two you have referred to?—Yes, there are oyster beds in what they call Lynn Well. You will find it marked on the chart. It is all oystery about Lynn Well.

16,732. Is the bed at Cleethorpe on the beach?—Yes, just on the edge of the low water.

16,733. (*Mr. Lefevre.*) How far does it extend?—For about two miles.

16,734. It is about two miles long?—Yes, from the point.

16,735. To the south?—Yes. The beds are laid in plots like gardens.

16,736. (*Mr. Caird.*) Are they indifferently fished, or do they belong to separate people?—They hire them.

16,737. Of whom do they hire them?—Of Lord Yarborough.

16,738. Do they pay rent for them?—Yes.

16,739. They belong to Lord Yarborough?—Yes.

16,740. What do they pay for the ground?—2*l.* a plot, I believe. They are only small plots.

16,741. How many plots are there on the whole bank?—A great many—above 100.

16,742. Where is the bank to which you referred first—where everybody may fish?—Off the Spurn.

16,743. (*Mr. Lefevre.*) At Donna Nook?—No.

16,744. At Saltfleet?—Yes.

16,745. How far does it extend?—Six or seven miles.

16,746. How far from shore?—About 10 or 12, and some parts only 2½ miles from the inside.

16,747. (*Mr. Caird.*) Is that bed dry at low water?—No.

16,748. (*Mr. Lefevre.*) What is the depth of water?—About three fathoms is the shortest depth.

16,749. What is the greatest?—I have been working in 9 and 10 fathoms.

16,750. Does it begin at Saltfleet?—Yes.

16,751. Between Saltfleet and Donna Nook?—A little to the north.

16,752. Where does it go to?—Below Trusthorpe Sands.

16,753. Between Trusthorpe and Sutton?—Yes.

16,754. How broad is it?—I do not know.

16,755. Does it go as far as the buoy?—No.

16,756. How near the shore?—Close to the shore; almost to what they call the Rose Sand.

16,757. (*Mr. Caird.*) Close to low water?—No, not to low water.

16,758. (*Mr. Lefevre.*) How broad should you say the beds are?—About 10 or 12 miles, I think.

16,759. How many boats are there engaged in dredging there?—About 50 sail in the summer season.

16,760. Do they dredge them in the winter?—No, they cannot work then.

16,761. Do the gales of wind disperse the oysters?—Yes, and the ground is so heavy they cannot dredge the beds. The oysters stick close to the ground in the winter season.

16,762. Do they dredge up both big and small?—Yes.

16,763. The big ones they take to market and the small ones they lay on the Cleethorpe beds?—Yes, and the Colchester men also get them and take them home for sale.

16,764. Do they place them on the beds at Colchester?—Yes.

16,765. You say they do not breed at Cleethorpe?—No, they do not.

16,766. What is the reason they do not?—They could not breed there.

16,767. Because they are not covered at low water?—Yes, the frost would kill them in the winter.

16,768. Do they breed at Saltfleet?—Yes, I have been fishing them on the beds there years ago with my father, and I see no difference in them now. There has been more at times after a heavy spat.

16,769. (*Mr. Caird.*) The spat is the spawn?—Yes.

16,770. (*Mr. Lefevre.*) I suppose there are variations in the supply if there is a good spawning year, or otherwise?—Yes. They sometimes go inside the Dowsings and work for them.

16,771. Are there any fixed places for working for them?—No, they go wherever they can find them.

16,772. Where is the other bed you were talking of?—Round the point at Burnham Flats.

16,773. (*Mr. Caird.*) May anybody who likes work there?—Yes. The beds go from Burnham Flats right down to the banks.

16,774. (*Mr. Lefevre.*) How long do you recollect that oyster-fishing?—Ever since I was a boy of 12 years of age.

16,775. How long have they been laid down at Cleethorpe?—Ever since I can recollect.

16,776. Are there any oysters found along the Yorkshire coast in Bridlington Bay?—No; we have tried there, but it is altogether too barren.

16,777. Then except on the grounds off Saltfleet and Burnham Flats, you do not find oysters in any quantity?—No; off Burnham Flats, and all up the Well, you will find them.

16,778. Have you been up the Wash dredging for oysters?—Not up the Wash, but off Lynn Well.

16,779. Have you found many in the Deeps?—No, but there are plenty of stones.

16,780. It hardly pays them to work there for oysters?—No, the work is too hard. There are 14 or 15 fathoms of water, and the bottom is full of stones.

16,781. You do not think that there has been any diminution in the supply of oysters?—No, I do not think there has been. We always reckon if there is any young spat on the ground, that if we tear it about it causes it to live.

16,782. (*Mr. Caird.*) If you dredge the ground when the spat is upon it, you think you increase the quantity for another year?—We reckon so. We have had spats and have not worked upon them and they have all died.

16,783. (*Mr. Lefevre.*) Do you buy oysters from the Cleethorpe ground?—Until this last season I have done so.

16,784. Did you buy there all the year round?—Yes.

16,785. Are they fit to eat all the year round?—Yes, some are, but some are not.

16,786. Do the fishermen know what are fit to eat at different times?—Yes, they know when the oysters are full of spawn.

16,787. Have they regular relays of oysters coming on at different times?—No, the men who have them are so poor, they cannot afford to put them down, only the small ones. As they catch the larger ones they must sell them to live upon.

16,788. The small ones they lay down?—Yes, in order that they may grow larger, and in the winter season they sell them to maintain themselves.

16,789. Are they unfit to eat then?—No.

16,790. Is there no season when they are unfit to eat?—They are only unfit to eat when they are full of spawn. They are not all full of spawn at the same time, only the odd ones.

16,791. Do they separate those which are full of spawn from the others?—No, they cannot do so.

16,792. They cannot tell whether they are full of spawn or not?—No, it rests with the opener to do that.

16,793. Is there a great difference in the price taking one year with another?—They are dearer now. They are more scarce.

16,794. (*Mr. Caird.*) Are they scarcer on the grounds?—No, but they are very bad to get.

16,795. Does your recollection go over a good many

GREAT GRIMSBY.

T. Campbell.

30 Nov. 1863.

years in reference to all the oyster beds you have mentioned?—Yes, I have been brought up to it all my life.

16,796. Fifteen or twenty years ago, were there as many oyster boats engaged in the fishery as there are now?—I think there were rather more if anything.

16,797. The oyster boats have not increased then?—No, they have not.

16,798. Has the quantity of oysters taken off the beds increased?—It is about the same.

16,799. Is the quantity the same?—Yes, about the same.

16,800. Has the business not been a sufficiently paying one to attract a large number of boats?—No. When they are stopped from working about the south they come here occasionally, and may make 5*l.* or so a week.

16,801. Do you think that the whole of the oysters might be taken away if there was not a very rough bottom?—Yes.

16,802. (*Mr. Lefevre.*) Do you think, if the oysters were allowed to remain upon the beds at Cleethorpe, they would spawn?—I do not believe they would.

16,803. Has the experiment ever been tried?—I have known oysters there for 10 years without spawning. We have had them spawning in our docks in abundance, but not on the beds at Cleethorpe.

16,804. (*Mr. Caird.*) In your docks there is always water?—Yes.

16,805. And on the beds at Cleethorpe there is no water twice a day?—Yes, in the neap tides they are not dry at all.

16,806. When are they dry altogether?—In the summer months.

16,807. In the winter, when the oysters are quite young, you think the frost would destroy them?—Yes, the water being cold in a sharp winter would kill all the young oysters.

16,808. Do you suppose that an oyster breeding ground ought always to be covered with water?—Yes.

16,809. With regard to other shell-fish, do you deal in whelks for bait?—Yes, I sell a great deal.

16,810. Where do you get them from chiefly?—Generally close to low-water mark off Burnham in Norfolk. One of my smacks came in from Wells this morning.

16,811. Is there any regulation as to the fishing of whelks off that shore?—No.

16,812. Anybody can go there?—Yes.

16,813. At any season they please?—Yes.

16,814. Is the supply of whelks there increasing?—I think they get as many now as they ever did.

16,815. Can you get as many as you require?—Some of my vessels have come in with 150 to-day.

16,816. One hundred and fifty what?—150 wash.

16,817. Does the take vary?—Yes, it depends upon the weather.

16,818. Are they all dredged?—No.

16,819. Are they picked up at low water?—No.

16,820. How are they caught?—They are caught in hoops, the same as crabs.

16,821. You put hoops down?—Yes.

16,822. Do you bait them?—Yes.

16,823. And you catch them in that way?—Yes.

16,824. (*Mr. Lefevre.*) You said just now that oysters spawn in the docks here?—Yes.

16,825. How is that?—The oysters come in with the tide, and I have seen the walls covered all over with very fine oysters.

16,826. Do they ever collect the spat in the dock?—No, they cannot. They do not see it until the oysters have got to perfection.

16,827. (*Mr. Caird.*) In what depth of water do you find that it pays you to dredge for oysters?—It depends upon whether there be any oysters.

16,828. Is there not a depth beyond which it would hardly pay you even if there were oysters?—I have myself been working for oysters in 18 fathoms of water. We are not very particular as to the depth of water if there are oysters to get.

16,829. Generally, in what depth of water do you get oysters?—At Saltfleet the depth averages from three to seven fathoms.

16,830. But the depth of water does not much affect the fishing?—No, but we like shoal water best.

The witness withdrew.

The inquiry was then adjourned until Saturday, December 5th, at Hastings.

Hastings, Sussex, Saturday, 5th December 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | GEORGE SHAW LEFEVRE, Esq., M.P.

MARK BREACH called and examined.

HASTINGS.

M. Breach.

5 Dec. 1863.

16,831. (*Mr. Caird.*) You are a fisherman here, I believe?—Yes.

16,832. Have you been long acquainted with the state of the fishing business at Hastings?—I have been in Hastings all my life. I was born in Hastings. I am a native of Hastings, and I have been in the fishing trade all my life.

16,833. Can you tell us, taking a period of 20 years back, whether the supply of fish brought to the market here by the fishermen of Hastings now has increased or diminished compared with what it was 20 years ago?—I think there is quite as much fish brought here now as I have ever known. The fishing has been very good, especially this summer.

16,834. Has this been an unusually good fishing season?—It has been a very good fishing season for trawl-fish.

16,835. Can you tell us what different kinds of fish are brought into this place in the greatest abundance?—We get whiting, plaice, and mackerel, and we have had a good supply of soles; indeed, we have a good supply of mackerel, turbot, soles, brill, mullets, skate, and all descriptions of trawl-fish. With regard to herrings they have been rather slack this season.

16,836. With respect to all these different kinds of fish, has the supply, in your opinion, continued to be good, compared with what it was 20 years ago?—Quite as good. It is equally as good, in general, as ever it was.

16,837. Is there any particular kind of fish that, within your experience, has diminished in quantity on the average?—Not any. There has been no diminution in any kind that I have seen, except herrings. We have had an abundance of all other kinds, but we have been slighted by the herrings.

16,838. Can you tell us the number of boats engaged in fishing now, compared with what it was 20 years ago?—I do not know the exact number, but I should think it has increased about double.

16,839. Can you give us the precise figures?—I should think we had 50 or 60 at one time, and now we have about 120 of all classes.

16,840. On the average, are your boats about the same size, or are they larger?—They are much larger. They are double and treble the size.

16,841. Do they carry the same number of men now that they did formerly, or do they carry more?—We have a different class of boats altogether now. The large boats carry from eight to ten hands, and the small ones which are engaged in trawling carry

three. The larger boats do not go trawling; they are only engaged in the herring and mackerel fishery.

16,842. Do you know what number of men are engaged now compared with the number engaged 20 years ago?—Taking them altogether, fishermen and fisher boys, there are about 600 or 700.

16,843. Have you any notion what the number was about 20 years ago?—I think it has increased one-third at least.

16,844. Will you tell us the different kinds of fishing that are practised here. I want to know what the different kinds of boats are, and the different kinds of net and line that are employed?—We use the herring and mackerel net, and the trawl net on the trawl-boats.

16,845. Leaving out of consideration for the present the herring and mackerel-fishing, by what mode of fishing is the bulk of the fish caught?—By trawl-fishing.

16,846. Are the trawl-vessels decked vessels?—No, they are open boats.

16,847. Open boats?—Open boats, belonging to Hastings; they are half-decked boats.

16,848. How many people are there in each of them?—Three.

16,849. Do you know what is the length of the beam of the trawl?—It is about 28 feet.

16,850. Has that long been the size of the trawl beam used here?—No. The beam is larger than it was formerly. The boats are larger now by four feet than they were formerly, and in that way they have increased the length of the beam. It used to be 26 feet long, but now we have got larger boats we have thought it necessary to have larger beams, and the length of the beam now is about 28 feet.

16,851. How many of the boats you have named will be engaged altogether in trawling?—Perhaps there may be about 50.

16,852. Then the great proportion of your fishermen here will be trawlers?—They are trawlers, herring men, or mackerel men, according to the seasons as they come round.

16,853. Are some of the boats employed in the herring and mackerel-fishing as well as in trawling?—Yes.

16,854. (*Mr. Lefevre.*) Are the same men employed?—Yes. When the boats go to the herring and mackerel-fishing they have extra hands to heave the winches. They are not particular who they get to do that. They do not require fishermen for that work.

16,855. (*Mr. Caird.*) Is the largest bulk of the fish caught here caught by the trawlers?—Yes; but they get a great quantity of herring and mackerel here in the season; at the same time I think the greatest bulk caught is caught by the trawlers.

16,856. Have you many line fishermen here?—No; not very many.

16,857. Do they fish with long-lines or with hand-lines?—With hand-lines.

16,858. Has the number of hand-line fishermen here increased or not within recent years?—There are very few more now than there used to be. I do not think that they will muster more than 8 or 10.

16,859. Do you mean 8 or 10 boats, or 8 or 10 men?—8 or 10 boats to go hooking.

16,860. Are they decked boats?—No; they are little open boats that go along the coast.

16,861. Has the quantity of fish caught by these boats increased or diminished within the last 20 years?—The last season they were off the coast here their take of fish increased a great deal. A little boat would go off and bring ashore 30 score of whiting. They have been very numerous here, and have increased in numbers considerably.

16,862. Have you heard any complaint of a general decrease in the catch of fish by the hand-line fishermen?—Not at all.

16,863. Not in recent years as compared with what the catch was previously?—No.

16,864. At the present moment do they make a good business of it?—The fishermen in general are not making a good business at this time, but when they have fine weather for fishing they can get plenty of fish.

16,865. Is the price as good now as it was 20 years ago?—The price is about the same as usual.

16,866. (*Mr. Lefevre.*) Do they catch cod or haddock here at all?—Only very few.

16,867. (*Mr. Caird.*) Do your trawl-vessels go far out to sea?—Some of them fish from seven to eight miles off, and if they have very good weather they may go from 12 to 16 miles from the land.

16,868. What depth of water do they fish in?—About 23 or 24 fathoms of water.

16,869. Are they ever in the habit of trawling in Rye Bay?—Yes; that is the principal ground for trawling.

16,870. Do they trawl there in shallow water?—Yes.

16,871. What kind of fish do they get there?—All sorts of fish; almost every kind of fish you can mention.

16,872. But are they not principally flat-fish?—Yes; plaice, soles, turbot, and skate. They also get whitings, and occasionally codfish.

16,873. Has that bay been trawled over for many years in succession within your recollection?—I believe it has been trawled over for centuries; long before my time. There have been trawlers there all my time, and my father's, and my grandfather's, too.

16,874. That bay has been trawled over, as far as al lrecord goes, as a matter of constant and regular practice?—Yes.

16,875. It has been constantly fished with the trawl net?—Yes.

16,876. Has there been any apparent diminution in the quantity of fish caught, year after year, in Rye Bay?—Not a bit; there are quite as many there now as I ever knew.

16,877. Then, if you were told that the system of trawl-fishing as practised in Rye Bay has caused the fish to become exhausted, you would not, from the knowledge and experience you have of that bay, believe that to be the truth?—I should say that it is decidedly untrue.

16,878. Have you ever heard the line fishermen complain of the injury done to them by the trawl fishermen fishing in-shore?—Not a bit of it. The trawling does not affect the line-fishing at all.

16,879. Would it not affect it by diminishing the fish?—It might do so if the fish had diminished; but now when we get within the bay they are quite as plentiful as ever they were. There are as many codfish, and whiting, and hook and line-fish as ever. As far as we are engaged here, which is not very long, for line-fish, they are as plentiful as I ever knew them to be. We get here a fish called the bream, in the summer season, and they have been more numerous than they were ever known to be before. They have got immense quantities of them with the hook and line.

16,880. Do the trawl-boats bring the same kinds of fish ashore as the line-boats?—They get trawled whiting and trawled bream.

16,881. Are the trawled whiting and the trawled bream in as good condition as similar fish caught by the line?—Yes, they are in quite as good condition, except that occasionally the scales may be a little rubbed off.

16,882. Would you give as good a price for trawled whiting and bream as for hooked whiting and bream?—Yes, I would; and sometimes they will fetch more.

16,883. If the system of trawling was restricted, and abolished altogether in Rye Bay, do you think it would seriously diminish the quantity of fish brought into the market here?—We should scarcely get any at all.

16,884. Would not the line fishermen be able to supply the deficiency?—No, not one hundreth part of it.

HASTINGS.

M. Breach.

5 Dec. 1863.

16,885. Then is the great bulk of the fish brought in here caught by the trawlers?—Yes. The town and fisheries of Hastings are supported by trawling, and if you were to take the trawls from them you would create as much, if not more, distress than the great distress which has been experienced in Manchester and the manufacturing districts.

16,886. Would any injury be done if a regulation were enforced restricting the places in which the fishermen should be permitted to use the trawl; do you think that would do any injury to the fishing generally?—No. I think if they were prohibited from fishing during three months in the year, or within three miles of the shore, the fishing generally would be greatly benefitted.

16,887. During what three months should they be prohibited and from what part of the shore should they be excluded?—I think the months of June, July, and August are the three months during which they should be prohibited.

16,888. And from what part of the shore?—All round the coast.

16,889. (*Mr. Lefevre.*) What kind of fishing would you prohibit?—Any fishing whatever.

16,890. (*Mr. Caird.*) In the deep sea or anywhere?—No, not in the deep sea; only within three miles of the shore.

16,891. And during the summer months?—Yes.

16,892. What is your reason for recommending such a restriction?—Because we have had the injury which this sort of fishing does brought so frequently to our notice. In the summer season we constantly see boats trawling within those buoys you see off a place here we call Wapping. These boats come in and land a basket of soles of a middling size, and then another basket of soles about the length of my finger. Now if the boats were not fishing there at that time these small soles would go into deeper water, and they would be catching them now in a condition fit to be caught.

16,893. What do they do with these small soles; are they sold?—Yes, they are sold.

16,894. Do they realise a good price?—No, they are sold almost for nothing; perhaps for 2*s.* or 1*s.* 6*d.* a basket.

16,895. Is there a large quantity of small soles brought in?—Each boat will bring in three, four, or five baskets.

16,896. Is there a larger quantity of these small soles than of the larger soles?—There are many more small soles than large ones. The small ones are not allowed to grow into large fish, but they are caught because they go off the ground.

16,897. What is the proportion of the large soles compared with the small ones?—There will only be one basket of large ones, and four or five baskets of small ones.

16,898. Then the catch at a certain season of the year comprises fish which is sold to the poorer classes?—Yes.

16,899. And sold at a very cheap rate?—Yes; they will sell it for anything they can get for it; just what they can catch.

16,900. But if it is the fact that notwithstanding the catching of these small fish the supply of large fish is not diminishing in Rye bay, but that year after year it seems to keep perfectly good, and is rather increasing than diminishing, what is the injury of which you complain?—Why, I think we should have a better supply still of good fish if these small fish were not taken.

16,901. You think they would grow to be much larger?—Yes; and although we have a considerable increase now, I think we should get double the increase in future years.

16,902. Is there a sufficient quantity of fish caught by your own fishermen here to supply the market at Hastings?—Yes; and to supply other markets as well.

16,903. But do you not get a supply from London?—Yes, when the weather is bad, and our boats cannot go to sea.

16,904. Have you any means here of keeping fish in store, so as to feed the market by degrees?—No, we have no well vessels. All ours are dry-bottomed vessels. Occasionally we can keep a little with ice, and in that way.

16,905. Do the French fishermen come along your coast?—Yes, the French boats come into Rye bay.

16,906. (*Mr. Lefevre.*) Are they trawlers or line fishermen?—They are trawlers.

16,907. (*Mr. Caird.*) Is it in the summer time that they go into Rye bay?—Yes; they go into Rye bay within six or seven miles of the land.

16,908. Do they not come within such a distance of the shore as to enable them to catch these small fish?—No.

16,909. Is there anything to prevent them from doing so?—I believe there is a law that they shall not fish within three miles of the coast.

16,910. Is that law observed?—Sometimes they come and fish for herrings close in, and also for mackerel occasionally.

16,911. Is there any fishery officer or Government officer who regulates the fishing?—I believe that the Revenue cutter has orders to settle any disputes that may arise.

16,912. And to prevent the French fishermen coming within the three-mile limit?—Yes.

16,913. Do you know anything about the size of the mesh of the nets that are used here for fishing?—Do you mean the mesh of the trawl nets?

16,914. Yes?—They are of different sizes.

16,915. Is there any oyster-fishing here?—Not nearer than Eastbourne.

16,916. Do your men go from Hastings to Eastbourne to fish for oysters?—No, they do not go for oysters.

16,917. Are there any other shell-fish caught here?—Very little. Scarcely anything worth speaking of.

16,918. I understood you to say that the herring fishery here has very much declined this year?—Yes, there has been a great falling off in the herring fishing this year on this coast.

16,919. Has the falling off been gradual, or is it exceptional this year?—It is exceptional.

16,920. Have you usually a good herring-fishing here?—Yes, generally.

16,921. At what time do you fish for herrings?—In October and November up to December.

16,922. In what state are they caught during these months; are they in good condition?—Sometimes they are in good condition, and sometimes they are without roes, and are in indifferent condition. It is according to the manner in which the shoals come along. Sometimes we catch them in deep water, and sometimes in shallow water.

16,923. They have had an unusually fine season at Lowestoft and Yarmouth; are you able to say whether there is any rule, that when they have a good season there, you have a bad one here—is it found that a good season in the one place is followed by a bad season in the other?—No, I think not.

16,924. Nothing of that kind has been observed here?—No.

16,925. Is there anything to which you can attribute the bad season here?—No, only to the fact that the fish have not come to this Channel.

16,926. Do you think that there is any mode of fishing practised here that has interfered with them in any way?—Not at all.

16,927. There is no regulation of any kind that can be held in any way to have diminished the herring-fishing?—No, not at all.

16,928. Do you know a place called the "Ridge?"—I have heard of it, but I never was there. I believe there has been a great abundance of herrings off that part.

16,929. (*Mr Lefevre.*) What is the tonnage of the boats you have here?—The large boats will run from

22 to 29 and 30 tons, and the smaller ones from 12 to 14 and 15 tons.

16,930. Are boats of 30 tons the largest boats that can be drawn up on the beach here?—Yes.

16,931. Could you not manage larger boats here?—I think we could haul up a boat of 120 or 130 tons.

16,932. Is there any complaint here of the want of a harbour?—The fishermen want it very much.

16,933. Is it difficult to get the boats off in bad weather?—Yes, very difficult; it is quite as much as we can do. We have to find employment in getting the boats filled. There is a certain amount of ballast to be thrown in and out.

16,934 If there was a harbour here, could your boats go out in any sort of weather?—Yes, and we might have larger and better boats.

16,935. Do the trawlers go out to the North Sea, or do they confine themselves to the coast?—It is only the larger boats that are engaged in catching herrings that go to the North Sea.

16,936. There is the largest class of boats sent off the Yorkshire coast for the herring-fishing?—Yes.

16,937. At what time do they go away?—In September.

16,938. And what time do they come back?—We are expecting them back now.

16,939. Do they bring their fish here?—No, they take them to Scarbro', Whitby, Yarmouth, and other places, but I think their principal market is Yarmouth.

16,940. Do they cure them there and sell them?—Yes.

16,941. The fish here are later, are they not?—Yes; we generally fish up to Christmas, but the fish seem to have taken off altogether this year. Last night one boat put off, and shot her nets, and only got 20 fish.

16,942. Do the herrings spawn here?—I have known them do so sometimes.

16,943. Are they full of spawn when they come here?—Sometimes they are ready to spawn. I have seen them throw their spawn on the deck when they have been brought out of the water on to the boats.

16,944. Do your herrings fetch a good price here?—Yes.

16,945. At what distance from the coast are your herrings caught?—From half a mile to 20 miles. Sometimes we go over to the French coast.

16,946. Can you say whether the boats catch more fish within the three mile limit or beyond it?—That all depends; there is no certainty.

16,947. There is no general rule?—No; we generally get a better catch off our grounds.

16,948. Do the French boats come within the three-mile limit here?—Yes, they come within two miles sometimes.

16,949. Is there anybody to prevent them doing so?—The Preventive men do sometimes. If a dispute arises they will interfere and order them away.

16,950. Who orders them away?—The Revenue cutter.

16,951. Is there a large quantity of fish sent from here to Billingsgate?—Yes. Billingsgate market takes all the overplus of fish, with the exception of what is sent to Brighton. I believe part of the fish goes to Brighton, and part to Liverpool, to Birmingham, and to other places.

16,952. Do all the fish that are sent from here go by rail?—Yes.

16,953. Do any of the fishermen here land their fish in France?—No; the French people will not allow them to do so.

16,954. Do they prohibit it?—They do not absolutely prohibit it. In point of fact, they would allow them to land it if they paid a certain duty, but that duty is so high that the fish is prohibited altogether.

16,955. What duty do they pay?—I do not know exactly, but after paying the duty there would no be enough left to allow the fishermen to realise a profit.

16,956. Then there has been no case of exporting fish to France?—We have sent fish from this market by steamboats over to France in small quantities. For instance, a good deal of mackerel goes from this place to Paris.

16,957. Does that pay a duty?—No.

16,958. Then you do not think that the English fishermen land their fish at Boulogne, and other places?—I do not think they do, although I have sometimes put a few on board a steamboat to go across to the French market.

16,959. Do you think it would be a benefit to the English fishermen if they had the power of selling their fish in France?—I have no doubt of it. It would be a great boon to the English fishermen.

16,960. Have they ever tried to do so since the French Treaty came into operation?—No.

16,961. Why not?—Because we believe the duty is more than the price we could realise.

16,962. But if the duty is not too much to prevent mackerel being sent over, how is it that it would not pay to land the fish there?—Because they go only in small quantities.

16,963. You were speaking of the line-fishing and trawling off the coast in summer time. What number of boats are engaged in that?—Do you mean in line-fishing?

16,964. No, the trawlers trawling a short distance from the shore?—About 50.

16,965. Is there a large quantity of small fish caught there?—Yes, a great deal.

16,966. Does that description of trawling extend far from Hastings?—It goes on from Bopeep Bay right down into Rye Bay.

16,967. Is there any fishing at that time in deep water?—There is some fishing, but it does not pay. It is rather slack fishing then. They do not follow it as they would if they were compelled to go there, and were prevented from fishing in-shore.

16,968. If a stop were put to this in-shore fishing, would it put a stop to fishing altogether?—No, they would fish then on the off-grounds; they would go then and catch all they could on the off-grounds.

16,969. I understood you to say that the fishing off the coast is not so good then?—It is hardly as good but sometimes they get a good fishing.

16,970. You say that the small fish that they catch fetches a small price in the market?—Yes.

16,971. Then does it not pay the fishermen to catch them?—It is generally a small class of boats that fish in-shore; the larger ones fish outside.

16,972. Would not a regulation prohibiting the fishing in-shore prevent a large quantity of fish from being brought to market?—Perhaps it would, but I do not think that the fish they bring into the market is of any good to us; it is rather an injury to those who bring them into the market. We had better never see it at all. It would be far better to let it bide where it is.

16,973. Do the herrings go off the French coast?—Sometimes we have had great shoals off the French coast. I see by the papers that this season they have knocked off catching them. They would not pay the expense of getting them into the interior of the country.

16,974. Have boats gone off from here to the French coast?—I believe there is one off there now.

16,975. Are the boats here adapted to go great distances?—The larger ones will go any distance; the smaller ones go only as far as Yarmouth.

16,976. (*Mr. Caird.*) Do the herring boats that go to Yarmouth in a bad season here find that they have better luck at Yarmouth?—The larger ones make their season there; they seldom fish at home.

16,977. Is Yarmouth a better place for catching herrings?—They want to go to a place where there is a harbour, so that they may be able to get in and out. We have no harbour here.

16,978. Then the want of a harbour is injurious to the fishermen here?—Yes, it does us very great injury indeed,

16,979. Do you think that if you had a good

HASTINGS.

M. Breach.

5 Dec. 1863.

harbour here the fishing interest would be much benefited?—I have no doubt that the fishing boats here would increase double.

16,980. Have you a fishing ground here that would attract fishermen in any numbers?—Yes, there is no better fishing ground in the world.

16,981. Do the Torbay fishermen trawl off your coast?—Yes, there are 36 that come here in the summer. They migrate from Ramsgate to Torbay, and they come and make their season here in Rye Bay.

16,982. Do any of your line fishermen complain of injury done to them by the trawlers?—No.

16,983. (*Mr. Lefevre.*) You have no large class of trawlers here, I believe?—No, because we have no accommodation for them to come in.

16,984. If you had a harbour, do you think you could have a larger class of trawlers?—Yes, I have no doubt that we should. We should have trawlers then that would be fitted out like the Brixham and Ramsgate trawlers. They would make this place their head-quarters.

16,985. (*Mr Caird.*) What has been the difference in the average price of fish generally during the last 20 years; what have been the variations?—Fish has increased in value one-third, taking it generally.

16,986. Have all kinds increased in value?—Yes, take it generally.

16,987. Has the price increased much in recent years?—Since we have had the railway here the prices have increased more than they did before, because in those days the expense of the carriage of fish in order to get it to London and different places had to be first thought of in buying fish. Now the fishermen get the benefit of the facilities which have been given for the better conveyance of the fish to market.

16,988. Is a large portion of the fish caught here consumed in Hastings and St. Leonards?—A great deal of it is.

16,989. Is much of it consumed by the lower class of people?—Yes. I suppose, taking All Saints' parish, that the principal food of the people there is fish, when they can get it, and when they can get it cheap.

16,990. (*Mr. Lefevre.*) Do you know how long this fishing for small fish in the summer months has been practised here?—Ever since I recollect.

16,991. But you have not observed that it has produced any diminution in the catch of large fish?—It is certain that we should have more fish if we did not kill the small ones. I do not notice any decrease in the number of large fish caught here, but we must remember that the taking of these small fish has always been practised and carried on. If it was done away with altogether I have no doubt that we should have a much better supply than we ever had.

16,992. Do you know whether any spawn is ever destroyed by any process of fishing?—We never see any spawn itself.

16,993. Have you never seen any brought up in the trawl nets?—I have seen spawn along the shore, but I never saw any in the trawl nets.

16,994. I think you have stated already that nobody interferes with you with regard to your mode of fishing here?—No.

16,995. There is no restriction of any kind as to the mode of fishing adopted here?—Not at all. We have never been interfered with.

16,996. (*Mr. Caird.*) During the herring-fishing are there any trawled fish brought in?—Yes, we get the Ramsgate smacks here; they fish for this market. It is a good market for them then. They get an extra price for their fish, because none of our men are out catching trawl-fish to supply the inhabitants. I believe they come here then to fish because they can make a better price, and do better than they can do in the North Sea.

16,997. (*Mr. Lefevre.*) The Ramsgate trawlers are of a larger class than your trawlers?—Yes.

16,998. (*Mr. Caird.*) Do the pleasure boats fish here?—Yes, the largest boats sometimes.

16,999. Do they catch much fish?—Sometimes they may go and not bring in any at all. At other times they may have a slice of luck, and may bring in 200 or 300 whitings.

17,000. There is no large supply caught by them?—No, it is a mere matter of pleasure and amusement.

17,001. It does not affect the price in the market?—Not at all.

The witness withdrew.

J. Page.

JAMES PAGE called and examined.

17,002. (*Mr. Caird.*) Are you a fisherman or a fish salesman?—A fish salesman.

17,003. Have you been a fisherman?—Yes.

17,004. Have you recently been at sea as a fisherman?—It is 17 years since I was fishing. I served my time to it, and I was 10 or 12 years fishing.

17,005. (*Mr. Lefevre.*) Can you tell us anything more than the last witness?—I know that the fish has increased rather than diminished.

17,006. (*Mr. Caird.*) Do you know from your own business that there has been an increase in the supply of fish?—Yes.

17,007. Is there a larger catch altogether brought in?—Yes.

17,008. Do individual boats bring in as much, or is there an increase only on account of the increased number of boats?—Taking what they brought in 17 years back, they bring in a great deal more now.

17,009. Does each boat bring in more than it did formerly?—Yes.

17,010. And there is a large increase in the number of boats?—Yes.

17,011. Then there must be a large increase in the supply of fish altogether?—Yes.

17,012. Are the fishermen making a better living out of it?—Yes, 17 years ago I used to go fishing for 7*s.* or 8*s.* and now they can get from 15*s.* to 20*s.*

17,013. From 15*s.* to 20*s.*?—Yes.

17,014. As their share per week?—Yes.

17,015. Do they fish by shares?—Yes.

17,016. Is there any fisherman employed by wages here?—Not one.

17,017. Do you know whether or no there is any quantity of young immature fish caught in the summer time near the coast?—In certain months of the year, perhaps during two or three months, there is a great quantity of small fish caught close in shore.

17,018. Is there a larger quantity of fish caught altogether on the whole?—Taking into consideration the larger number of boats that are engaged there is at times a very considerable quantity caught.

17,019. Does any part of it go to London?—Not that I am aware of.

17,020. Is it sold at home?—It is first sold on the beach.

17,021. Where is it consumed?—In different parts of the country inland.

17,022. Does any portion of it go to London?—Not of the small fish. It is very seldom that that is sent to London.

17,023. Does it go into consumption among the poorer classes?—Yes, and a number of inland towns about here take a great deal of that kind of fish every day in the week when they can get it.

17,024. Then if that mode of fishing were put a stop to it would be rather a hardship on the consumers at that season of the year?—I think not; they would have better fish for

17,025. Where would they get the better fish?—Outside, farther off at sea.

17,026. Could they catch it at the same time that they are catching the small fish?—I don't see why they could not.

17,027. But do the vessels go out further to fish at

that time?—Sometimes they go five, six, seven, eight, or ten miles off.

17,028. Do they get plenty of fish there?—Yes.

17,029. Could they make it a profitable business compared with the in-shore fishing?—I fancy it would be more profitable.

17,030. If it is more profitable why do the fishermen follow in-shore fishing?—That is followed by men who have smaller boats, and who do not care about venturing farther out to sea.

17,031. It is practised by a class of fishermen who cannot go far to sea?—They have not got a good craft to go further out, and they prefer fishing in-shore.

17,032. With that inferior craft do they fish further out at sea in other seasons?—In fine weather they may go seven, eight, or ten miles.

17,033. (*Mr. Lefevre.*) Have they a smaller mesh for their trawls?—No, I believe not.

17,034. Is it the same sized trawl as that used by the larger boats?—No, the trawl may be smaller in size, but the mesh is no smaller.

17,035. (*Mr. Caird.*) Is the mesh small enough to enable them to catch the small fish?—Yes.

17,036. Is there any shrimping here?—It is middling at times.

17,037. In the summer time do they catch any quantity of small flat-fish in the shrimp nets?—I know very little of shrimping. I have never been shrimping in my life, and therefore I can say very little about it.

17,038. Has the price of fish altered much within your experience of 17 years as a fish salesman?—It is nearly one-third more.

17,039. One-third higher?—Yes; I have been selling plaice at 2*s.* a basket 17 years ago, and now for four or five years past I have given 4*s.* or 5*s.* for the same quantity.

17,040. That has not arisen from any scarcity in the supply of fish?—No, and there is a great deal more demand for it. The railway has opened out to us districts where it was never sent to before, but to which we send fish regularly now.

17,041. Is a large proportion of the catch of fish here sent by railway?—Yes, all that is not consumed in the town and neighbourhood.

17,042. What proportion is sent by railway, taking the average throughout the season?—I should say that the largest half is sent away to the inland towns.

17,043. Is there as good a catch of turbot as there used to be?—They were never very plentiful on this coast in my time.

14,044. Are they as plentiful as they ever were?—I do not see any difference. I have known fishermen go years ago for a whole twelvemonth, and not catch more than a couple of turbot, while others would hardly catch a dozen.

17,045. Is the mackerel-fishing good here?—It was very indifferent last year.

17,046. What is the season?—We take May, June, and July to be the mackerel season here.

17,047. Was it unusually bad last year?—Yes.

17,048. Have you in average years a good mackerel season?—Sometimes we have a good season.

17,049. Have you any pilchards here?—Very few; sometimes we get 100 or 200.

17,050. It is no great source of advantage to the fishermen?—No, we never put in our nets for the express purpose of catching pilchards.

17,051. Have you any sprats?—We have three or four sprat boats, drift-net boats, that catch a few sometimes.

17,052. Is Rye Bay very famous for its fishing?—There is not a richer ground in the world, according to its extent.

17,053. Does it yield all the kinds of fish that are brought here?—It yields every kind of fish you can mention.

17,054. Do you agree with the previous witness that the supply of fish in Rye Bay has increased of late years, and not diminished?—Yes, there has been more taken out of Rye Bay in 10 months of this year 1863 than in any previous year.

17,055. Do you suppose that the whole of the bottom of Rye Bay has been constantly trawled over?—Yes, thousands of times, and I believe that the more it is trawled over the better it is.

17,056. Have you as a fisherman trawled in Rye Bay?—No, I never went trawling, except for about three years.

17,057. Did you trawl in Rye Bay then?—Yes.

17,058. Did you ever observe that you were trawling over the same ground as a vessel which had just been trawling in front of you?—Yes.

17,059. Did you find that by following in the track of that boat you got fewer fish?—No, we got more sometimes.

17,060. Have you seen a number of boats following in succession, and fishing over the same ground?—Yes, many a time.

17,061. Would all of them do well, and get a good quantity of fish?—Some would, but I cannot say they all would.

17,062. Is it the fact that when one trawl-boat is getting a good take of fish, another trawler will try to follow over the same ground?—Yes, in the same direction, day after day, and week after week.

17,063. The second boat will keep as near as possible to the same ground?—Yes, in the same depth of water.

17,064. Is the ground in Rye Bay good ground to trawl over?—Yes, it is a very soft good ground.

17,065. Is there any particular food there that the fish feed on?—There is when the ground is stirred up by the trawl. We think the trawl acts in the same way as a plough on the land. It is just like the farmers tilling their ground. The more we turn it over the greater supply of food there is, and the greater quantity of fish we catch.

17,066. Are there any mussel beds on this coast?—No, only on the rocks close in-shore.

17,067. Where do the line fishermen get their bait?—We have not much hooking here. Those who follow it have sprats for bait, mackerel for bait, or herring, according to the season.

17,068. Do they ever use whelks?—Yes.

17,069. Whelks are used for bait here?—Sometimes, when they are catching codfish, in the month of October.

17,070. Where are your best cod caught here?—Towards the eastward part of the coast, on the "Hard" as we term it.

17,071. How far from the shore?—Not more than half a mile, but it extends further out in one part than in another. Perhaps in some places it may be two or three miles from the coast.

17,072. (*Mr. Lefevre.*) Do you know what size the mesh of the trawl is?—No, I cannot say; I should think 28 or 30 to the yard; some are not so much. Some will be 26 or thereabouts, but I don't know much about trawl nets now.

17,073. (*Mr. Caird.*) Do you know that there is a size fixed by law?—There was some talk about it some years ago, but I suppose it is all forgotten.

17,074. There has been nobody here to interfere with you?—No, and we keep on our old plan.

17,075. Do you think if the mesh were somewhat larger that these small fish would go through?—The smacks have got a larger mesh than our boats, and they bring ashore as small fish as we do.

17,076. You do not think that any regulation of the mesh will prevent the catching of small fish?—I don't see how anything of that sort could be acted up to.

17,077. What do you mean?—You may have as large a mesh as you like, and yet you will not prevent the catch of small fish.

17,078. Do you think the fish would not go through?—They would not go through unless you had lines across to allow them to go through. We carry lines on our nets. The smacks have a large mesh, but no line to keep the mesh open on each side.

HASTINGS.

J. Page.

5 Dec. 1863.

17,079. Have you a line on your mesh?—Yes, but the smacks have not; and that is the reason that the mesh draws down and shuts up like a tunnel.

17,080. Is there any cod-fishing to the westward; is there cod in Rye Bay?—There are some cod a long distance off, in the Channel. I believe the French fishermen find a good deal of fish there sometimes.

17,081. Are they found on rocky ground?—Yes.

17,082. Do the trawlers go on rocky ground?—No; if they got on the rocks towards Beachy Head they would get their nets torn.

17,083. Are there any line fishermen who go out from here to fish on the rocky ground?—There are hardly any line fishermen here at all. There are a few in the months of October and November.

17,084. Would it not answer?—No, I think not.

17,085. Why?—They would not get half enough fish to supply the town.

17,086. Do you know a description of net called the "kettle" net?—Yes.

17,087. Where are these nets used?—They are used on the coast of Kent, and two miles west of this town.

17,088. What are they used for catching?—Mackerel.

17,089. Will you describe these nets to us?—They are stake nets, about 11 feet high. They run out for about 200 yards, and form a circle of 200 yards round.

17,090. They are stake nets?—Yes, stake nets, about 11 feet high and 8 feet apart.

17,091. What is the size of the mesh?—There are about 32 to the yard; some are more, and some may be less.

17,092. Do you know at what time of the year these stake nets are set?—In May, June, and July.

17,093. Do they catch any salmon trout?—Sometimes.

17,094. But it is chiefly mackerel that they catch?—Yes; they are put up expressly for mackerel.

17,095. Is that the only mode in which you fish for mackerel?—There are drift-boats that go out mackerel-fishing. They are the same boats that go trawling now. They carry mackerel nets in the months of May, June, and July.

17,096. Are the kettle nets used between high and low water?—Yes.

17,097. And they are emptied at low water?—Yes.

17,098. Can you catch a great quantity of mackerel by that means?—Sometimes.

17,099. Is it a more successful mode of fishing than by the drift nets?—Sometimes. In one year I earned not a penny, and in another I may have earned 45*l.*

17,100. Is it an expensive mode of fishing?—It costs 64*l.*, the labour, horse and cart, and attending to it.

17,101. (*Mr. Lefevre.*) How much does it cost?—64*l.*

17,102. For three months?—Yes.

17,103. (*Mr. Caird.*) What will one net catch in the course of the season, taking a fair average season?—That I cannot say. Sometimes the catches may be very large, and then perhaps we may go for a whole season the very next year and not catch anything.

17,104. Do you get much fish in the kettle nets except mackerel and salmon trout?—Sometimes we get a cod, and sometimes a herring.

17,105. Is it an injurious mode of fishing?—No, I think not. They are seining mackerel at the same time, and that is much worse.

17,106. Do you see any objection to the use of that net?—I don't see why it should not be used. There are plenty used from Beachy Head to Folkestone.

17,107. Is it a common mode of fishing here?—Yes, and it has been for a century. I can recollect them 30 years ago myself.

17,108. (*Mr. Lefevre.*) They are used from Beachy Head to Folkestone?—Yes.

17,109. Do you know in what numbers they are used?—No; but they have them on this side of Beachy Head, and right down past Rye up to the Ness by Romney Marshes, and down to Sandgate.

17,110. What distance will they be one from another?—From 300 to 400 yards; but it is not convenient to set them everywhere. Sometimes there is nothing but rocks, and then these nets would be of no use. I had some kettle nets in Bopeep Bay, but I have given them up there because they caught no fish.

17,111. Must you have a sandy beach for them?—Yes. The water must go out a good distance, and that is the reason you require so much net.

17,112. Is there a considerable quantity of fish caught in that way?—In some years there is; in others there is none caught; it all depends upon the weather.

17,113. I understood you to say that it was an expensive mode of fishing?—Yes; and it costs the same to attend to it whether there are any fish or none.

17,114. Have you had your nets out this year?—Yes.

17,115. How many fish did you catch?—The most we caught in one day was 800.

17,116. How much will you catch in the course of a season?—We made 140*l.* this year.

17,117. I thought you said you only made 64*l.*?—That was one share, but it would not come to 64*l.*

17,118. Do you mean that the expense was 64*l.*?—Yes.

17,119. And you earned 140*l.* altogether?—Yes.

17,120. How many were there to share it?—There were only two shares. The first year we had them I lost 64*l.*, I and my partners.

17,121. Has this been a good year?—It was a middling year.

17,122. Do you catch any quantity of other fish besides mackerel?—No.

17,123. No small fish?—A few little smelts and sand eels.

17,124. What size is the mesh?—There are about 32 overcomes to the yard.

17,125. Is it an open mesh?—Yes, every mesh stands out open, with lines both at the top and bottom.

17,126. Is that in order that the small fish may get through?—Yes. If any small fish get in, the biggest part of them get through.

17,127. (*Mr. Caird.*) Has anyone a right to put up a net of that kind without asking leave of the adjoining proprietor, or anyone else?—No. No one is allowed to do so unless he has obtained the consent of the person over whose land he would have to pass.

17,128. Do you pay anything to the person to whom the land belongs?—I do.

17,129. Do you pay for the privilege of going to the nets?—Yes, I pay Mr. Farncombe, who lives about two miles from here, for the privilege of going over his land.

17,130. You pay a rent for the thoroughfare, and not for the privilege of putting the nets into the sea?—Nobody claims anything for allowing me to put the nets into the sea.

17,131. No one levies any charge at all for that?—Not that I am aware of.

17,132. Nobody regulates in any way the number of nets that are to be put up?—No.

17,133. You may put up as many as you like, and as near to each other as you please?—I never knew anything to the contrary.

17,134. I suppose you do not pay much for the right of passing to your nets?—Only 10*s.* a year; I pay it as a sort of acknowledgment to prevent my claiming any right.

17,135. No rent is charged for the ground on which your nets are placed?—No.

17,136. (*Mr. Lefevre.*) Do you find that you catch more in that way than by the drift net?—I do not use the drift net.

17,137. Do you think that more are caught by the kettle nets than by the drift nets?—It all depends; if they come close in we get a good many, but they must come within 200 yards of the shore before we catch them; the drift-net boats do not come so close as that. I have seen the mackerel very close in in Hastings Roads.

HASTINGS.

J. Page.

5 Dec. 1863.

17,138. Do you think the kettle nets are as profitable as the drift-net fishery?—They are not very profitable; I do not suppose that I have had 6*d.* an hour from them ever since I had them. I set very little store by them; I would sell my nets for a very small profit.

The witness withdrew.

ROBERT KENT called and examined.

R. Kent.

17,139. (*Mr. Caird.*) You are a boat builder here, are you not?—Yes.

17,140. Have you been long here as a boat builder?—I have been in Hastings ever since I was born, and I have been working at boat building for about 28 years.

17,141. Are you building boats now of a larger size than those that were built 20 or 28 years ago?—Yes, they are as large again.

17,142. Has the number of boats very greatly increased during these 20 years?—There are a great deal more now than there were 20 years ago, but they have not increased very much during the last two or three years.

17,143. Can you tell us what the increase has been during the last 20 years, or say 10 years?—I should say they have increased nearly one-half during the last 20 years.

17,144. But during the last two or three years there has been no increase?—Not very much, there have been hardly any new ones for the last two or three years.

17,145. What has been the cause of that?—The mackerel-fishing has been very bad.

17,146. Has it arisen from any general decline in the fishing, or only from the mackerel-fishing?—I don't think it has arisen from any general decline in the fishing; the shoals of fish take different routes, so that we are not always able to get at them.

17,147. Have all the different kinds of fish, except mackerel and herrings, continued to progress?—The trawling has been progressive.

17,148. Is the greater proportion of the boats you have built intended for trawling?—Yes.

17,149. What is the average tonnage of the trawl-boats here?—The average tonnage of the trawl-boats is about eight, nine, or ten tons.

17,150. Are they half-decked boats?—Yes, lug rigged; we call them luggers.

17,151. You build nothing larger for the mackerel-fishing?—Yes, we build boats of from 15 up to 20 tons.

17,152. Are the fishermen of your acquaintance improved in their circumstances?—The herring season this year has been a very bad one for them, and the last mackerel season was very bad also; they had three seasons before that, three mackerel-fishings that were very bad, therefore we can see no considerable room for improvement.

17,153. Is the mackerel-fishing a large proportion of the whole fishing along here?—The trawling is the principal fishing.

17,154. Has there been any diminution in the catch of the trawlers?—Not at all; I should say there were more fish caught out of Rye Bay last summer than in any summer I have ever known.

17,155. Then you agree with the previous witnesses that there has been no apparent diminution in the number of fish caught by the trawlers in Rye Bay?—I do.

17,156. Or on any part of the coast that you are acquainted with?—I quite agree with them in that matter.

17,157. Do you think that much injury has been done to the fishery by catching small fish in the summer?—Of course if they catch them when they are so small they never allow them to get large; I do not think that any harm would be done if they fished further off the shore in the summer months.

17,158. If fishing in-shore were prohibited during the summer months would you be deprived altogether of these small fish at that time?—We should catch small fish further from the land, but not in such great quantities.

17,159. Would you get any other fish to make up the loss you thereby sustained?—I think the fishermen would get better remunerated for their services if they went further from the land.

17,160. I believe you are not a fisherman yourself?—Not at all.

The witness withdrew.

EDWARD NOAKES called and examined.

E. Noakes.

17,161. (*Mr. Caird.*) You are a fisherman here?—Yes.

17,162. Have you been long a fisherman at Hastings?—About 51 years.

17,163. What mode of fishing do you practice?—I have been at all sorts; mackerel-catching, trawling, and herring-catching.

17,164. Have you found, as a trawl fisherman, that the quantity of fish you can catch has diminished or increased?—I see but little difference in it.

17,165. Can you get as many now in your trawl as you did formerly?—Not quite as many; formerly I have been getting fish, such as plaice, in the winter time and throwing them overboard because there was no market for them; we find it quite different now.

17,166. Can you sell everything you catch now?—Yes.

17,167. Nothing is thrown overboard at all?—I do not believe there is; we have a market for it now. Before it would not pay us to send it to market.

17,168. Do many persons come here from other places and become fishermen here?—I think not; but the Ramsgate and Torbay men come here fishing.

17,169. Do the Torbay trawlers come here?—Yes.

17,170. Has there been a large increase in the number of fishermen here during the time you speak of?—Yes, they have increased wonderfully.

17,171. Has the increase been chiefly in native fishermen?—Pretty much so; there have been a few strangers, but not a great many.

17,172. We are told that the number has more than doubled within the last 20 or 30 years?—I expect it has.

17,173. And does each fisherman make as good a business of it as formerly?—Yes.

17,174. Does each catch as much fish as was the case in former years?—Yes, I think so at times.

17,175. But take the average?—Yes, I think they catch as much.

17,176. Has any kind of fish fallen off in your recollection?—The mackerel season has fallen off in the drift-net fishing.

17,177. Has it not fallen off in the kettle nets as well as in the drift nets?—I cannot say, there are so many of them; sometimes they catch a great many in certain tides, and sometimes but very few.

17,178. Has the number of kettle nets increased?—Yes, I believe there are more kettle nets now than there used to be.

17,179. Is that a cheaper mode of catching mackerel than by the drift nets?—If they don't come in-shore they cannot catch them in the kettle nets, while the drift nets are in the sea at all times.

17,180. Then you have the advantage at sea?—With a breeze at sea we catch them outside, but if there is fine weather then they are skimming inside.

17,181. Have you been a hook-and-line fisherman?—No.

17,182. Have you ever heard the hook-and-line

HASTINGS.

E. Noakes.

5 Dec. 1863.

fishermen complain of a diminution in the number of fish they take?—No.

17,183. Do you think they catch as many as they did?—I think they catch more bream than ever they did.

17,184. If any one said to you that trawl-fishing had injured the fishing generally, would you say that that was not true?—I cannot say that any injury has been done to the drift-net fishing.

17,185. Is there any way in which the fishing has been injured?—I don't think there is.

17,186. I believe the great bulk of all the fish that are caught here are caught by the trawlers?—Trawl-fish are caught by the trawlers in Rye Bay. There are sometimes great quantities, and sometimes they are very scarce.

17,187. Are there any French fishermen in Rye Bay as well as English fishermen?—Yes, a great number come within half a mile of the shore sometimes.

17,188. Are there ever as many Frenchmen as Englishmen?—No, there are not as many, but now and then they come in considerable numbers.

17,189. Have they larger boats than yours?—Yes, larger boats and larger gear.

17,190. With a longer beam and bigger trawl?—Yes.

17,191. (*Mr. Lefevre.*) The same as the Ramsgate vessels?—Yes.

17,192. (*Mr. Caird.*) Do they make a good fishing?—No doubt it pays them, or else they would not come.

17,193. Do they go straight home again with their catch?—Yes, as soon as they get a good catch they go home. We have a great deal of trouble sometimes with the French fishermen; they will come where we are fishing. If a Frenchman sees me fishing he will come and put his nets down alongside of me, and he will drive me away if he can.

17,194. Have you ever fished on the French coast?—Yes.

17,195. Have you been interfered with there?—The Coastguard would interfere with us if we went within the three-mile limit.

17,196. Do they come within the three-mile limit on this side?—Yes, they come within a mile of the shore sometimes.

17,197. Does anybody say anything to them?—Now and then the Revenue cutter has ordered them away.

17,198. Have you ever fished on the Dutch coast?—No.

17,199. Do you fare better in a French port with your fish?—I have been in a French port, but never with fish.

17,200. Do you think it would be of advantage if you were allowed to go to a French port and sell your fish?—I think it would be in the herring season.

17,201. Do you think it would be of advantage in any other season?—It would not be of much advantage then. Now and then it would be of advantage to go in in the mackerel season. I have been as far as North Sunderland fishing in the herring season. I went away in July once, but we did not find it answer our purpose and we declined fishing there. We went there for two seasons.

17,202. Why did it not answer; did you not get a good catch?—No, and it was so cheap. We left at the latter part of the mackerel season to try there, but as it did not answer our purpose we gave it up after two years.

17,203. Has the herring-fishing declined much here of late years?—Sometimes there has been a goodish season, and sometimes it has been very bad.

17,204. It varies?—Yes.

17,205. Sometimes it is good and sometimes it is bad?—Yes.

17,206. There has been no progressive decline?—Not any. You cannot tell, one season from another, whether it will be a good one or a bad one until it is ended. This season has been very bad.

17,207. Do the herrings always come here at the same time?—Yes, pretty much. The large boats go away in September.

17,208. They go north?—Yes.

17,209. When do you generally begin fishing off this coast?—We generally begin about October.

17,210. And continue the fishing during November and December?—Yes, during November and December.

17,211. Do you fish in January?—Very seldom.

17,212. Are the fish not in condition then?—No, they are out of season altogether.

17,213. (*Mr. Lefevre.*) Have you a boat of your own?—Not now. I have given up going to sea.

17,214. How long have you given it up?—For the last two or three years.

17,215. Then you had a boat of your own before that?—Yes, two or three. I have nets now.

17,216. Do you let them out?—I send them to sea.

17,217. Do you get a share for them?—I take a share the same as the rest of the men. I take one for the hire of the nets.

17,218. Of what size were your boats?—They were of the smallest class, 25 feet long.

17,219. Did you go out to North Sunderland in a boat of that description?—No, I went in one 30 feet long. Is was not my own boat.

17,220. Was that a half-decked boat?—Yes, it was half-decked, but I have also been there in one that was full-decked.

17,221. I suppose you recollect the time when there were no Ramsgate men or trawlers here?—Yes, I can recollect when they came here very seldom.

17,222. It is about 30 years since they came?—Yes.

17,223. Previous to that time were there any trawlers off here except the Hastings boats?—No, unless the Brighton people came in the spring of the year and fished for a couple of months.

17,224. How long have the French people been in the habit of coming off this coast?—For 20 or 30 years they have come close to the shore, but they generally fish in the Channel. The large French trawlers generally keep the Channel.

17,225. Is it not more than 20 years since they came to Rye Bay?—No, I think not.

17,226. Have they been increasingin numbers of late years?—At times there may be 20 or 30 sail. Sometimes there are only one or two; it all depends upon whether they can get fish on their own shore.

17,227. Then take it all round, there are a great number more trawlers fishing in Rye Bay now than there used to be?—Yes.

17,228. Quite independent of the Hastings trawlers?—Yes; the Folkstone people come sometimes.

17,229. Have there been great quantities of fish caught here?—Yes, and supposing that one boat goes down to the same depth of water day after day it would in all probability get about the same quantity of fish every day as it did on the preceding day.

17,230. You say that the mackerel-fishing has fallen off?—Yes.

17,231. Is that only for the drift-net boats?—I cannot say what is the reason why it has fallen off.

17,232. Do they catch as many mackerel in the kettle nets as they did formerly?—They do at times.

17,233. During the last three or four years?—They have not done so well for the last three years as they did before.

17,234. Then you do not attribute the falling-off in the catch of mackerel to the use of the kettle nets?—No, I don't think they do any injury to the fishing.

17,235. (*Mr. Caird.*) Would you as a fisherman think it any hardship to be excluded in the summer months from fishing with the trawl within three miles of the shore?—Some of the smallest of the boats would consider it a hardship.

17,236. Is there a large number of small boats

HASTINGS.

E. Noakes.

5 Dec. 1863.

here ?—There is not any great quantity. Sometimes after a strong wind they will put their trawls down close in-shore, and they will get a quantity of small fish. They get some good-sized soles and plaice, but there is a great deal of small fish along with it.

17,237. Have you ever seen great quantities of small fish brought on shore ?—Yes ; I have seen it thrown overboard, and I have been throwing it overboard.

17,238. I thought you said you brought it on shore and sold it ?—We generally pick it.

17,239. Then is there a large quantity thrown overboard ?—Yes, we shovel it overboard alive as fast as we can get it into the sea.

17,240. I thought you told me in the early part of your examination that none was thrown overboard ?—Some of our people do throw it overboard at times.

17,241. Were you speaking then of a different class of fish ?—If we did not throw it overboard occasionally the expense of sending it to market would be more than it would fetch.

17,242. Is it your opinion, and also that of the fishermen with whom you are acquainted, that an injury is done to the fishing generally by catching small fish in summer ?—I have not seen any difference during the last ten years, and there was more small fish caught then than there is now.

17,243. Was a great quantity of small fish caught then ?—Sometimes a vast amount of the brood would be caught, but it was always thrown away.

17,244. Then the system of catching small fish is not at all new ?—No, it has gone on for many years, but a good deal of it is thrown overboard again.

17,245. Do you not agree with the previous witnesses that it would be of advantage to the fishermen generally if that system were put a stop to ?—It might be, but I cannot say.

17,246. (*Mr. Lefevre.*) Do you only catch the small fish close in-shore at that time of the year ?—We catch more then at that time of the year.

17,247. Do you think if it were not caught at that time of the year that the same fish would be caught when they grew larger ?—I cannot say anything about that.

The witness withdrew.

W. Wood.

William Wood called and examined.

17,248. (*Mr. Caird.*) You are a fisherman here, I believe ?—Yes.

17,249. And have been so for some years ?—Yes, for the last 30 years.

17,250. What mode of fishing do you practise ?—All sorts ; both mackerel and herring-catching and trawling.

17,251. Have you found that the supply of fish has increased or diminished ?—The trawling has been better for the last seven or eight years than for a number of years previously.

17,252. Is it continuing every year to get better ?—Yes, the trawling has been getting better for the last five or six years.

17,253. What do you suppose is the cause of that ?—I am sure I cannot say.

17,254. Is it followed with greater assiduity ? Do the fishermen make more of it because the price of fish is better ?—The fish are as good now as ever they were.

17,255. How is the price of fish ?—It is better now than it was ten or a dozen years ago.

17,256. Then is it a more profitable business for the fishermen ?—Yes, the trawling is.

17,257. Do they follow the business with greater assiduity because it is more profitable ?—Yes.

17,258. Do they fish more closely than they did ?—Sometimes they fish closer in and sometimes further off.

17,259. I do not mean closer in shore, but do they fish more constantly ?—Yes.

17,260. In what depth of water do you get the largest catches of fish ?—In about 16 or 17 fathoms of water, about 12 miles off the land.

17,261. Within what bounds east and west do you usually trawl here ?—Rye Bay is the principal place in which we trawl here.

17,262. On this side of Dungeness ?—Yes.

17,263. Between this and Dungeness ?—Yes.

17,264. Is that where the largest proportion of your fish is caught ?—Yes.

17,265. (*Mr. Lefevre.*) Outside the four-fathom sand ridge ?—Yes.

17,266. (*Mr. Caird.*) Is that far from the land ?—12 or 14 miles off.

17,267. Do you ever go as far as the Ridge ?—No, I never go trawling on the other side of Dungeness.

17,268. Do all the trawl-boats from Hastings fish in Rye Bay ? Do they never go eastward of Dungeness ?—No.

17,269. Do you find plenty of fish in Rye Bay ?—Yes, and there has been more for the last few years than there ever was before.

17,270. (*Mr. Lefevre.*) How far do you go westward ; as far as the Royal Sovereign shoals ?—No, not quite as far as that, but pretty handy.

17,271. About 14 miles off the coast ?—Yes, in the middle part of the bay.

17,272. How far when you are off Dungeness ?—Not more than two or three miles then.

17,273. (*Mr. Caird.*) Do you trawl with the tide ?—Yes.

17,274. Does the tide run strong here ?—Nothing to speak of. It runs middling like. The spring-tides run about a couple of knots an hour.

17,275. What has been your heaviest catch, in one catch, with the trawl net in the course of the last four or five years ?—I can hardly tell. Sometimes we have got seven or eight pads, and sometimes with a good tide we have had 14 and 15 pads. I think I have known a smack occasionally catch 16 or 17 pads, and even as high as 20 pads, with a tide.

17,276. What weight of fish is there in a pad ?—I suppose about half a cwt.

17,277. What different kinds of fish will there be in ten pads ?—Plaice, dabs, and all sorts.

17,278. Which are in the largest quantity ?—Plaice is generally in the largest quantity.

17,279. Is there any particular kind of fish that has fallen off at all ?—Not the least bit in the world as far as trawl-fish are concerned ; on the contrary they have increased.

17,280. You say that in trawl-fishing there has not been any diminution ?—No.

17,281. Has there been any diminution in the line-fishing ?—The hook-and-line fishing ?

17,282. Yes.—I am not much acquainted with that.

17,283. Has there been any diminution in any fishery here ?—I cannot see that there has been any decrease at all in the trawl-fishing. When I first went to sea I found it a good job if I got a bushel of plaice in a night ; now I can get seven or eight bushels in the summer time.

17,284. Is that the average catch of all the boats ?—Yes.

17,285. It is within your knowledge that a boat now makes a better catch than 20 years ago ?—Yes, a great deal more.

17,286. And there is a vast increase in the number of boats ?—Yes, there are a good many more people.

17,287. And there has been a great increase, not only from here but from all places fishing in Rye Bay ?—Yes.

17,288. Do you see many French boats fishing there ?—Yes, in the summer time, and Torbay men as well.

17,289. Is there any mode of fishing adopted here which in your opinion is injurious to the supply of fish ?—None that I know of.

HASTINGS.

W. Wood.

5 Dec. 1863.

17,290. What is your opinion with regard to catching small fish in the summer season? Do you think that that is injurious?—I do not see that it does any good.

17,291. Does it do any harm?—Of course if you catch the small fish they cannot grow up to be large, and if it were put a stop to it would be all the better for the fishery. I would put a stop to it for two or three months in the summer time.

17,292. Would you put a stop to in-shore fishing altogether?—Yes, in the months of June, July, and August. I believe those are the principal months in which the fish breed.

17,293. Is there any fishery officer here or any authority who interferes with you in your fishing and regulates the mode in which you are to fish?—Not that I am aware of.

17,294. Nobody has ever asked you about the size of the mesh of your nets, or the length of the beam of your trawl?—I never heard of anyone interfering with our fishing in that manner.

17,295. Do you think it is desirable that there should be some officer of that kind?—I don't think it would make any difference. If I had a large mesh I could easily stop the mesh up by not putting lines upon it.

17,296. How would you do that?—By having no lines put on the net. If the meshes are put on straight and have no lines on them they will draw up and close no matter how big they are.

17,297. Then do you think that if there was a regulation fixing the smallest size of the mesh it could be easily evaded in that way?—Yes.

17,298. A fisherman might adopt the regulation size, and at the same time so fish his nets as to catch small fish?—Yes, however large the mesh is we can stop it up if we like.

17,299. How can you stop it up?—By drawing it up close together. It will shut up of itself, but if we have a line down the meshes will remain open. The strain of the fish pulls the meshes together, and closes them if there is no line.

17,300. (*Mr. Lefevre.*) What is the line of which you speak attached to?—It runs up and down the net on each side, and keeps the mesh open. When there are no lines the mesh draws down.

17,301. (*Mr. Caird.*) Then if any regulation were adopted as to the size of the mesh it would also be necessary to have a regulation as to the mode in which lines should be put upon the net?—Yes, if there was no line it would shut up even if the mesh were double as big; it would keep sand in as well as small fish.

17,302. (*Mr. Lefevre.*) Can the small fish get out when you have a line?—Yes.

17,303. Do you use nets with lines?—Yes, but the Torbay men do not.

17,304. (*Mr. Caird.*) The Torbay men do not use any lines on their nets?—No.

17,305. Do their nets drag together then in the way you have described?—Yes, and they catch small fish in consequence.

17,306. Do you think that the Torbay men find it to their advantage to do that?—Yes.

17,307. But you do not seem to find it so?—No, we always have lines.

17,308. You do not want to catch small fish?—No, they are of no good to us.

17,309. What can be the use of them to the Torbay men who are even still further from their markets than you are?—They throw them overboard.

17,310. I cannot see what object the Torbay men can have in fishing in that way?—Every port has a different plan of fishing.

17,311. Is the line upon the trawl net of which you have spoken peculiar to Hastings?—Yes, it has always been used in Hastings since I can recollect.

17,312. Have you ever seen it in any other boat except a Hastings boat?—No only in the Hastings and Brighton boats.

17,313. Have you ever been in a smack fishing?—No, never.

17,314. You say that the object of these lines is to prevent you from catching immature fish?—Yes.

17,315. And they succeed in that object you think?—Yes, they do.

17,316. (*Mr. Lefevre.*) What is the size of the mesh of the trawl net?—I suppose there are about 27 or 28 "overcomes" or meshes to the yard. Some are wider, and some may be 30, 34, or 35.

17,317. (*Mr. Caird.*) If these lines have the effect of preventing small fish from being caught, would a regulation enforcing on all the fishermen here the use of those lines prevent the damage which is said to occur?—I cannot see but what it would do a great deal of good.

17,318. Would it prevent small fish from being caught?—Yes.

17,319. I presume that the nets used in the summer season in shallow water in-shore have no lines; is that so?—No, they all have lines.

17,320. Then how is it that they catch small fish?—Because the meshes are small, you see.

17,321. Do they use a smaller mesh?—No, it is the same size in the mesh, and the same trawls. Sometimes we use the trawl we use in the winter.

17,322. (*Mr. Lefevre.*) What is the size of the smallest fish you catch?—At times they are caught no larger than the nail of your thumb.

17,323. Nothing escapes?—No.

17,324. Even now?—No, the nets will stop anything almost.

17,325. Even when lines are used?—Yes, our mesh is rather small, and it gets blocked up with weed and sand, and all kinds of stuff.

17,326. Suppose you had a larger mesh, say $1\frac{3}{4}$ inches from knot to knot, would that prevent the catch of small fish?—We should not catch as many small fish then.

17,327. Suppose that the mesh of the net of your trawl were of that size, and you also used the lines of which you have been speaking, would a great many fish that you catch now go through?—There would be a wonderful sight go through.

17,328. Do you know that $1\frac{3}{4}$ inches from knot to knot is the legal mesh?—I have heard that there is a size laid down, but I don't know what it is. I know there is a law upon the subject.

17,329. But that law is not observed?—No.

17,330. Have you a boat of your own?—No.

17,331. How long have you been a fisherman?—Nearly 31 years.

17,332. Do you find that you make as much by the business now as you did when you first began?—I can make more in the trawling season, but for the last two or three years there has been a failure at Hastings. The mackerel and herring seasons have been bad.

17,333. Take the last few years, have you made as much in them as you did formerly?—Trawling has been better, but I have been for six months out of the 12 engaged in the herring and mackerel-fishing which has been bad. If I had been trawling all the time I should have done much better.

17,334. The herring and mackerel seasons have been bad for some years?—Yes, they have been bad for these last 10 years.

17,335. Have as many mackerel been caught by the kettle nets as before?—Yes, I think so.

17,336. Then the falling off has been mainly in the drift-net mackerel-fishing?—I do not know whether the kettle nets make much difference. What they catch in the kettle nets we cannot catch in the drift nets. The cause of the falling off is, I believe, that there have not been so many in our channel as there have been in former years. For two months there have been plenty of mackerel here. There have been more mackerel in Rye Bay than ever was known.

17,337. When was that?—Last month and this.

17,338. Why do you not go after them?—We

caught 6,000 mackerel in the herring nets at one time.

17,339. Was that later than usual?—Yes.

17,340. Then to what do you mainly attribute the falling off in the mackerel season?—I cannot answer that; I do not know.

17,341. Do you think there are less mackerel off this coast?—There have not been many mackerel to speak of of late years compared with what they were 10 years before.

17,342. They have been falling off during the last 10 years?—Yes.

17,343. Do they come now at a different season?—Quite at a different season altogether.

11,344. Do they interfere with the herring-fishing?—The herring-fishing for the last two years has been very bad.

17,345. Have you fished off the east coast?—Yes, from the Land's End asfar as North Sunderland. I have fished in Mount's Bay.

17,346. When do you generally go fishing on the east coast?—Generally in the month of July.

17,347. And when do you come back?—We come back again in October.

17,348. Do you stay there for the Yarmouth fishing?—No we went as far as North Sunderland.

17,349. You went to the Northumberland-fishing?—Yes, in the summer season.

17,350. And you came back here for the winter-fishing?—Yes, and then we go in for our own fishing.

17,351. Has that been profitable during the last few years?—No, we have done very badly indeed.

17,352. What is that owing to?—Because we have caught no fish.

17,353. Do you mean the herring season?—Yes, the herring season.

17,354. On the east coast?—Yes.

17,355. Last year?—Yes.

17,356. What has it been this year?—I have not been at it this year.

17,357. (*Mr. Caird.*) Do you as a fisherman experience any disadvantage in consequence of not having a port you can run to in stormy weather?—It would be a great deal better for us if we had a port.

17,358. Do you think if you had a harbour, which you could get into at low water, it would increase the number of your fishermen?—I think it would be of benefit to the fishing of Hastings.

17,359. Would many more people come here?—I think there would.

17,360. Is there plenty of ground to supply any number of fishermen who choose to come?—I think there will be plenty of fish for the trawlers for many years to come.

17,361. Have you ever seen a seine net used here?—Yes, there were plenty here last summer.

17,362. What do they catch in the seine nets?—Mackerel.

17,363. Do they catch any young fish—small fish?—A good deal at times when they draw out on the shore.

17,364. (*Mr. Lefevre.*) A seine net is always drawn out on the shore, is it not?—No, sometimes they close them together and fish them at sea instead of drawing them on shore.

17,365. (*Mr. Caird.*) Is any injury done to the fishing by the use of seine nets?—I do not think they do any harm.

17,366. Does anybody complain of them?—I never heard any complaint but I have no doubt there are always some people who will complain.

17,367. Upon what ground do they complain?—I don't know I am sure.

17,368. You have not observed that any injury has been done by the seine-net fishing?—No, I have never seen any harm done in the least.

The witness withdrew.

William Stonham called and examined.

W. Stonham.

17,369. (*Mr. Caird.*) Have you long been a fisherman here?—Yes, ever since I have been big enough to move my hands.

17,370. Have you practised all kinds of fishing?—Yes.

17,371. Do you agree with the previous witnesses that there has been no diminution in the quantity of fish you can catch now as compared with what you caught when you first began?—No, when I began I went four months for 30*s.* or 40*s.*

17,372. What can you make now?—Sometimes now I make a little more and sometimes a little less.

17,373. You have told us what you made then, cannot you tell us what you make now?—This season I have been three months herring catching for 6*l.* or 7*l.*; the first time I was mackerel catching and I got about 40*s.* for the first four months.

17,374. Do you think that the quantity of fish you can catch has increased or diminished off Hastings?—I don't see much difference in the mackerel and herring. Some 15 or 16 years ago the mackerel were plentiful and the herrings were slight, then the mackerel became slight and the herrings more plentiful, and now for the last two seasons both have been slight.

17,375. Do yo know of anything that does injury to the fishing?—I think if the drawing nets were kept back for two or three months in the year it would do good.

17,376. Is there nothing further of which you complain or which you wish to speak to us about?—No.

17,377. (*Mr. Lefevre.*) What are the draw nets; are they seine nets?—No; a man will go and pull it round to the shore and sometimes they work it at sea.

17,378. What harm do nets of that description do?—They catch small fish.

17,379. What are they fishing for?—For mackerel.

17,380. Do they catch as much small fish as the trawlers do?—No, the small fish are not as plentiful as where they go trawling.

17,381. Do they catch smaller fish when trawling than in these nets?—No, not smaller but a little more altogether; they get bigger lumps of it. Here they only fish a quarter of a mile off.

17,382. Have you trawled in the summer months?—Yes, and in the winter too.

17,383. Have you made much money by trawling in the summer months?—Sometimes we have.

17,384. Do you find that you catch large quantities of small fish?—Sometimes.

17,385. Do you bring it all ashore?—No, not one-third.

17,386. Do you throw the other two-thirds overboard?—Yes, all alive.

17,387. Is it usually alive?—The biggest part is alive.

17,388. Do you think it would be a good thing to put a stop to trawling in the summer months?—Yes, I think it would within two or three miles of the shore.

17,389. Would you catch fish further off at that time?—We must try to do so; perhaps we might not catch quite as much.

17,390. Have you ever tried what you could get by fishing further off?—Yes, five or six or seven or eight miles off at the same time that boats have been fishing in-shore. What we object to is that some will get close in and destroy the brood. If it has been blowing for two or three days there will be a few good soles along with the small fish.

17,391. You do not wish to catch the small fish?—No, we do not wish to see it disturbed.

17,392. Do you bring ashore any quantity of small fish?—Not any great quantity; we pick out the best part of it and let the other go.

17,393. Do you sell it very cheap?—It has not

HASTINGS.

W. Stonham.

5 Dec. 1863.

been very cheap this last few months. It has not been as cheap as it used to be some time back.

17,394. Do you ever sell any for manure?—I never did sell any for manure.

17,395. Do you recollect any time when it has been sold for manure?—No, but I had some given to me once.

17,396. That is not the case now?—No.

17,397. All is bought for food?—Yes. Last summer I brought a few lots ashore, and picked the best out, and left the rest on the beach, but in general it is all carried away for eating.

17,398. Do you think that the trawlers in general would like to see trawling stopped within three miles of the shore?—Yes, I should myself, and I should also like to see the kettle nets stopped.

17,399. You would not then catch the big soles that come in?—We must stop till they go out again.

17,400. (*Mr. Caird.*) Would you put a stop to all kinds of in-shore fishing?—If I could have my way I would.

17,401. Do they not catch good soles then?—Yes and little ones, which they sell for manure.

17,402. Have you seen any large quantity sold for manure?—Yes, a waggonload.

17,403. Lately?—No, not lately.

17,404. How long ago?—16 or 17 years ago. They were brought to the fish market and then carried away for manure afterwards. That was before we had the railway.

17,405. (*Mr. Lefevre.*) Are there any dog-fish off here?—At times.

17,406. Do they come in after the small fish in the summer?—Not in the summer.

17,407. Are there any fish that feed upon the small fish in the summer?—I believe a good deal of fish do. The fish we throw overboard does good in that way. They eat one another.

17,408. They eat one another?—Yes, they eat some, not all.

The witness withdrew.

R. Adams.

RICHARD ADAMS called and examined.

17,409. (*Mr. Caird.*) Have you heard the evidence that has been given to-day?—Yes.

17,410. Do you agree with what has been stated?—I do chiefly, especially with regard to the trawling system.

17,411. Do you think there is an increase of fish compared with what it was in earlier times?—Yes.

17,412. Of all kinds of fish?—Yes, of all kinds of trawl-fish.

17,413. Is there any mode of fishing practised here which you think is injurious to the general interests of the fishery?—I cannot see that there is in particular.

17,414. Are there any restrictions of any kind on your fishing?—I do not know of any.

17,415. Is there any suggestion you can offer for improving the fisheries?—I cannot see anything you can alter except the fishing in-shore.

17,416. Do you desire to see a stop put to in-shore fishing in the summer months?—Yes, I think it would do none of us any harm if we were prevented from fishing within three miles of the shore.

17,417. You think that in the summer time all the fishing craft should fish a little further from the land?—Yes, I think so.

17,418. Would it be an expensive business to guard the shore so as to carry out such a regulation?—I think not.

17,419. (*Mr. Lefevre.*) Do you trawl at night as well as in the day time?—Yes, that is the time when we catch most fish.

17,420. (*Mr. Caird.*) If a regulation were adopted prescribing that no fishermen should fish within three miles of the shore during the summer months, do you think it could be easily enforced?—I cannot say. You would have to keep a good watch to keep us all clear, and many times you would not be able to tell whether we were within the boundary or not.

17,421. (*Mr. Lefevre.*) You would be obliged to have the Revenue cutters?—Yes, the one on duty here could do it, however. It could stop it generally.

17,422. (*Mr. Caird.*) Do you think it would be of advantage to the general interests of the fishery here if that were done?—Yes.

17,423. Have you any other suggestion to make to us?—No, except in respect of the size of the mesh. I do not think it would make any difference at all if we had it larger, if there were no lines on the net; it would make no difference at all.

17,424. (*Mr. Lefevre.*) You do not think, if the mesh of the trawl net was larger, that it would allow the immature fish to go through?—No, if you have no lines on your net you can pull them just as tight as you like. There would always be a way to get over the difficulty; they would manage the nets so that it would make no difference.

17,425. What is the size of the mesh you use?—About the same as was stated just now. They say 27 or 28, but that is only the half mesh; we chiefly use about 14.

17,426. What is the size?—About $1\frac{1}{4}$ inches.

17,427. Are you aware that $1\frac{3}{4}$ is the legal mesh?—No; nobody ever came to put any law in force. We always use our own discretion respecting the mesh. If we had a mesh that would let a small flat-fish, such as plaice, or a small bream, turbot, or so on, through, we should never stop a whiting or a mullet.

17,428. Do you catch many whitings?—Yes, at times, in the off channel.

17,429. How are they caught?—In the trawl. The whiting is a round fish, they would go through. What would catch a small flat-fish would never stop a whiting, mullet, or anything of that sort.

17,430. Have you a boat of your own?—No.

17,431. Are the boats here mostly owned by fishermen?—Some are owned by fishermen, and some by men on shore.

17,432. How is the owner of the boat paid?—He is paid by the share.

17,433. How many shares do they divide upon?—Four in trawling?

17,434. Are there only three men in each boat?—Yes.

17,435. And the boat takes a man's share?—Yes.

17,436. What does the boy get?—We have no boy; we only carry three men. Three men and the boat make four shares.

17,437. That is in trawling?—Yes.

17,438. How is it in herring-catching?—In the herring season we carry six men and a boy.

17,439. What are the shares then?—We then carry so many nets. Each 14 nets take a share. Some will have 60 and 65 nets. We make altogether 12 shares and a half.

17,440. How many does the boat get?—One share and a quarter.

17,441. Each 14 nets take a share?—Yes, and also each man. The boy has half a share.

17,442. Are the nets chiefly owned by the fishermen?—Yes.

17,443. Some of them let them out, do they not?—Yes, they let them out when they cannot go to the fishing themselves.

17,444. How long do the nets last?—Some will last five, six, or seven years, and some perhaps not one year. Sometimes they get damaged.

17,445. But what is the average?—Four or five years on the average.

17,446. What is the cost of a fleet of nets?—A fleet of 60 nets new top and bottom will cost 120*l.*, as they come from the manufacturers without any dressing to them.

17,447. The price has increased lately, has it not?

HASTINGS.

R. Adams.

5 Dec. 1863.

—Yes, they cost two guineas a net, and more than that.

17,448. What will a new boat with a fleet of nets and ropes, all included, cost?—I should say it would cost 400*l.* or 500*l.* altogether.

17,449. As much as that?—All that.

17,450. That is a half-decked boat?—Yes.

17,451. Can it also be used for trawling?—Yes; we call them trawl-boats. The larger ones we call luggers; they only go two seasons, they never go trawling at all.

17,452. Do you find that you can make as good seasons as you used to make?—Yes, I see no difference.

17,453. Are you much interfered with by rough weather in the winter here?—We have no shelter but this beach to run for.

17,454. Do you think if there was a harbour here you would often be able to get protection?—Certainly, and we should go more to sea. We don't stop as long as we should like, but if we stop past our time it is very difficult to get in on account of the rocks.

17,455. Do you see the Ramsgate and Torbay boats trawling off here when you cannot go?—Yes, if it sets in much wind we cannot cope with them. They are fishing when we are forced to be on shore.

17,456. Is any proportion of the season wasted in that way?—There are many times in the herring and mackerel seasons that we might be at sea when we are ashore. We could get out of a harbour when we cannot get off the beach.

17,457. (*Mr. Caird.*) How do you sell your fish? Do you sell them when you bring them ashore?—Yes; we ask a price for them, and then fall by degrees. We come down in our price instead of rising as at a regular auction.

17,458. (*Mr. Lefevre.*) It is a Dutch auction?—Yes.

17,459. (*Mr. Caird.*) Have you as a fisherman found that the price has considerably increased of late years?—Yes; because we have more convenience for sending the fish away.

17,460. For the same catch of fish you can now get more money?—Yes.

17,461. Is there much competition among the buyers?—There are more buyers because there are more fish brought ashore for consumption.

17,462. As a fisherman do you get the full benefit of the increased price?—Yes; we get more for it.

17,463. (*Mr. Lefevre.*) Are your herrings salted and cured here, or are they sent off fresh?—When we take them ashore we sell them to the buyers, who sometimes send them away salted and sometimes fresh.

17,464. Are there any number of fishermen at Eastbourne?—There are about 10 or 12 boats, but there are no trawlers at all.

17,465. What are they?—Herring and mackerel boats; there is also a shell-fish and a sprat fishery there.

17,466. What is the shell-fish fishery?—Crabs and lobsters.

17,467. Are there any oysters?—Yes; they go oystering.

17,468. Then beyond Eastbourne there is nothing until you get to Brighton?—No.

17,469. Is there no fishing at Newhaven?—Not much.

17,470. (*Mr. Caird.*) Is there any at Folkestone?—A little but not much.

17,471. What is there between this and Folkestone?—Nothing except kettle nets, and a few drift herring and mackerel boats at Dungeness.

17,472. Is there much fishing carried on between Folkestone and Ramsgate?—Nothing much.

17,473. Nothing at Dover?—No; very little.

17,474. At Deal?—There are herring boats, but no trawlers.

17,475. Do you know if there are any fishing towns to the west of Brighton?—Yes; there is Worthing.

17,476. Is that the only town of importance?—Yes, the only one.

17,477. (*Mr. Lefevre.*) Where do the French boats generally come from?—Boulogne, Treport, and Dieppe.

17,478. Do you ever go there to sell fish in the French ports?—No.

17,479. Do you know any one who has done so?—No.

17,480. You know of no fisherman who has sold fish within the last two years in a French port?—No.

17,481. Do you think it would be of any advantage to the fishermen here to be able to run to a French port, and sell their fish there?—I think it would at times. They might go across there to fish, and get a market at hand when they could not get here with their fish at all, as they would not be fresh when they got them in.

17,482. Would you like the Frenchmen to come here?—They do come now, but we would rather they did not.

17,483. Is there nothing to prevent them?—No, not at all.

17,484. You know of no one who has tried within the last three years to sell fish in French ports?—No.

17,485. Do you know that the duty on fish in France has very much diminished?—I do not know what the duty is, but I know that the French fishermen pay nothing in England. They land what they like.

The witness withdrew.

The inquiry was then adjourned until Monday, the 7th December, at Brighton.

Brighton, Sussex, Monday, 7th December 1863.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

BRIGHTON.

R. T. Saunders.

7 Dec. 1863.

RICHARD THOMAS SAUNDERS called and examined.

17,486. (*Mr. Caird.*) You are chief officer of the Coastguard, I believe?—Yes.

17,487. How long have you occupied that position here?—Three years on the 1st of next month.

17,488. Has your attention been much directed to the state of the fishing at Brighton?—It has principally been directed to it when any complaint has been made to me with regard to the smallness of the meshes of the nets. When such complaints have been made, I have considered it my duty to examine the nets.

17,489. Can you tell us the number of boats engaged in the various kinds of fishing here?—There are about 50 large sea boats, and about 50 herring boats, and about 200 pleasure boats; 50 of these are occasionally employed in fishing; they are adapted for fishing more or less.

17,490. Do you know what number of people altogether are engaged in fishing here?—I think there will be about four to each boat.

17,491. Four men to each boat?—I think that will be about the number, beach men and lads included.

17,492. Are there the same number of men in the large boats and in the herring boats?—Taking them altogether, there are about four in each boat.

BRIGHTON.

R. T. Saunders.

7 Dec. 1863.

17,493. That would be about 400 men altogether?—About 400 or 500, beach men and all included.

17,494. Are you aware whether the number of men and boats has increased or diminished in recent years?—Since I have been here there has only been an increase of three fishing boats. I do not think there has seen any addition to the number of small boats.

17,495. Has there been any diminution?—I think not, since I have been here.

17,496. Do you know the kinds of fish that are principally caught here?—Whiting, codfish, skate, herring, mackerel, and the principal part of all the fish that are caught in the English Channel. I believe they are all caught and brought here.

17,497. Is it principally hook-and-line fishing, or trawling, that is practised here?—Trawl-fishing.

17,498. Is there any hook-and-line fishing?—Yes, that is generally followed by the pleasure boats. If they are not employed in pleasure, they will take out long-lines, and sometimes fish with hand-lines; they fish principally however with long-lines.

17,499. Do you know whether the quantity of fish caught here now is as great on the whole as it was some years ago?—I do not know personally, but the fishermen say that it is not

17,500. Have you observed any diminution in the average quantity of fish?—I have not observed any diminution myself, I simply go by hearsay.

17,501. Do the fishermen themselves complain that the fish is decreasing on account of the use of seine nets, and of the small meshes that are generally used?—Yes, and the trawlers complain also.

17,502. Are the seine nets used here?—Yes.

17,503. Are there many seine nets used on the shore at Brighton?—Yes, very often during the summer; they are drawing them out throughout the whole of the day.

17,504. Is that only during the summer time?—Yes.

17,505. And in shallow water?—Yes, in-shore.

17,506. Have you observed them being used?—Yes, I have often seen them used.

17,507. Do they catch many small immature fish in them?—Yes, especially mackerel.

17,507*a*. Do they catch young mackerel?—Yes, all that come into the net are caught and brought ashore.

17,508. Do you think that any great destruction of fish has taken place by the use of these nets?—Yes.

17,509. How many months in the year are these nets used?—I think they are used for about seven months—from seven to nine months during the year.

17,510. What is the number of fishermen employed in the use of these nets?—They are all employed more or less, except the fishermen who are engaged in the larger boats. The fishermen employed in the herring boats, I think, use them more or less.

17,511. About one half of the whole of the fishermen here use them?—More than that.

17,512. More than one half of the whole of the fishermen fish with the same nets at certain seasons?—Yes.

17,513. Are these small fish to which you have referred saleable?—Yes, I believe they are all sold. Very few are left on the beach; they are generally sold or taken away.

17,514. Is there any other fish brought to the market in any quantity during the time these small fish are being sold?—Do you mean landed here on the beach?

17,515. Yes.—Oh, yes, they are landed on the beach all the year round; but we have also a great number of fish consumed here that come from London.

17,516. Could the fishermen employed in fishing with these seine nets make as good a business if they went out to the deep sea in the same way as the larger boats?—I cannot say; I would rather leave that question for the fishermen themselves to answer.

17,517. Are you yourself of opinion that fishing with seine nets and the destruction of these young fish have damaged the general productiveness of the fishery?—I am quite sure of it.

17,518. But you cannot speak of your own knowledge of an experience of more than three years?—No, not at Brighton.

17,519. In the course of these three years have you had any experience which convinces you that an injury has been sustained by the general fishery in consequence of the destruction of small fish?—Yes, I think so. We cannot get large fish when spawn is destroyed, and also the fish themselves when they are very young. I believe the operations I have referred to must inevitably destroy the brood of the fish.

17,520. Have you seen any spawn destroyed in the seine nets?—Yes, some.

17,521. (*Mr. Lefevre.*) What spawn was it?—I have seen spawn in the seine nets when they have been drawn in.

17,522. The spawn of what kind of fish?—I don't know.

17,523. (*Mr. Caird.*) But you have seen spawn in the nets?—Yes, and I have seen it on the coast.

17,524. It has been brought in by the seine nets?—Yes, when they draw the seines in.

17,525. Are the seines drawn from the shore?—Yes.

17,526. One man stands on the shore with the end of a line in his hand?—Yes.

17,527. And another man goes out with a net in a boat?—Yes, they surround a piece of water and then draw the line ashore and haul it in on the bank.

17,528. To what extent is this system carried on?—I have seen the seine nets used all along the beach at Brighton.

17,529. Among what class of people do these small fish generally go into consumption?—Generally among the poorer people.

17,530. Are they sold at a cheap rate?—Yes, they are not taken to the market.

17,531. What proportion of the whole of the fish taken by the seine nets will consist of these small fish?—I should think about one-sixth or one-eighth.

17,532. One-sixth or one-eighth of all the fish?—Yes, brought in by the seines.

17,533. So that only one-sixth or one-eighth of the fish caught by the seine nets are small?—About that.

17,534. Are the other five-sixths good fish?—Yes.

17,535. Then if you did not use such nets you would deprive yourselves of that five-sixths of good saleable fish brought ashore at that time?—Yes, I should say it would be about five-sixths.

17,536. Five-sixths are good and mature fish?—Yes, about one-sixth would be bad fish and five-sixths would be good.

17,537. Out of every six fish, one would be small?—Yes.

17,538. And the other five would be good?—Yes.

17,539. For the sake of saving that one fish, do you think it would be right to give up catching the five good fish?—I do not know whether it would be right to give up catching them; but according to my experience this is what happens. Sometimes you will draw the seine with 500 or 600 fish in it, and 100 fish out of the number is a great quantity to be small fish.

17,540. Are we to understand from your observation that, on the average, not more than one-fifth or one-sixth of the catch is small immature fish?—About that.

17,541. Would not the poorer classes of Brighton have great cause of complaint, if for the sake of saving that one-sixth of small fish they were deprived of five-sixths of the supply of fish which they get at present?—I should say not. I think the whole of the fishermen would much rather have the seines done away with throughout Brighton and all over the coast, but as a matter of course they will be able to tell you much better than I can.

17,542. (*Mr. Lefevre.*) What is the size of the mesh of the seine net?—The usual mesh is about $1\frac{1}{8}$ inch long.

BRIGHTON.

R. T. Saunders.

7 Dec. 1863.

17,543. How many of these seine nets are used?—I don't know.

17,544. Does fishing with the seine nets extend far here?—All along the beach along the Brighton station from east to west.

17,545. How far is that?—A mile and three-quarters.

17,546. Can they only be used on smooth ground?—Yes, not on rocky bottom.

17,547. They are not used if the ground is rocky?—No.

17,548. What fish do they generally catch with the seine nets?—Generally mackerel, I think.

17,549. Do you think that by any regulation as to the size of the mesh the catching of immature fish might be prevented?—I think they complain very much about the seine nets being used at all.

17,550. Do you not think that any regulation as to size of the mesh would have the same effect as putting a stop to the seine fishing altogether?—I think not. I think what the fishermen wish is to have a stop put to it entirely.

17,551–2. Have any complaints been made to you as to the size of the mesh?—I have only had three complaints made to me, and they have generally been by people who have been intoxicated over night. Next morning when I sent for them I could not find them at all in Brighton. It has happened in this way: I have come across a man who has had a little drop of beer, and he has complained that particular persons have been using nets with a small mesh. If I have spoken to other fishermen about it, they have told me to go to him and examine his nets first, adding, that I should find them as bad as any. But the person who made the complaint has never appeared the next day to substantiate it.

17,553. Are you aware whether during the three years you have been here the whole supply of fish has decreased here?—I have heard the fishermen say that it has.

17,554. Does that apply to the three years you have been here?—Yes, I have heard them say that the fish are decreasing.

17,555. Do you think that is to be attributed to the mode of catching fish, or to bad seasons?—I think it is most likely owing to the smallness of the mesh and so on.

17,556. Have any complaints been made to you of the size of the mesh of the trawl nets?—I think the last complaint made to me was about trawl-nets; it was made by a man named Andrews, who has a trawl-boat.

17,557. Are you an officer of the Customs?—No, of the Coastguard.

17,558–9. Have you any authority to look after the size of the mesh?—Yes.

17,560. What instructions have you as to the size of the trawl nets?—These are the only instructions I have; I have all the different Acts of Parliament.

17,561. Is it part of your instructions occasionally to overlook the trawl nets?—Yes, if any complaint is made.

17,562. But not otherwise?—Not otherwise.

17,563. Do you know what the legal mesh of the trawl net is?—It is down in the Act of Parliament.

17,564. Do you know what it is yourself?—No, I cannot tell from memory unless I go to the Act itself.

17,565. Can you say when you look at the mesh of a trawl net whether it is of the legal size or not?—Not without measuring.

17,566. But on measuring it you can?—I can refer to the Act then.

17,567. What distance do the trawl-boats go off from here?—About 20 miles from here.

17,568. Do they go from here to Rye Bay?—I do not know.

17,569. What is the season here for herrings?—The herring-fishing is all the year round.

17,570. They catch the herrings all the year round?—Yes, the herring-fishing is all the year round.

17,571. Is there no season when they go out more than another after herrings?—Yes, now is just the time.

17,572. When does it commence?—About the 1st of October.

17,573. How long does it last?—It lasts during all the winter.

17,574. Has it been a good year here so far?—No, it has been a very bad year. We have had none. It has been pretty good in the north, but we have had none here.

17,575. Has it been an exceptionally bad year?—It has been very bad, I believe. I have never known a worse.

17,576. What is the mackerel season here?—The mackerel season is in the summer.

17,577. What time does it generally begin?—In May or June and lasts throughout the summer.

17,578 How long does it continue?—Until August.

17,579. Have you yourself seen spawn brought up in the seine nets?—I have seen it on the beach.

17,580. When they have been drawing the seines?—Yes, for mackerel.

17,581. Are you sure it is not spawn that has come from the bellies of the fish?—I don't know that; I cannot say where it comes from.

17,582. You have not looked to see whether it has been drawn up in the net or how it has come?—No; after the nets have been drawn and the fish have been taken away, I have seen it there.

17,583. What kind of spawn is it; what does it look like?—It is regular spawn of a yellowish kind; I cannot describe it further than that.

17,584. Is it in lumps or is it thinly spread over?—It is thinly spread; it is not in lumps.

17,585. You are perhaps not well enough acquainted with the spawn of fish to say what it is?—No.

17,586. But you are sure it is spawn?—Yes, I have heard the fishermen themselves particularly complaining about it. They say, "Look at the small fish, and look at the spawn." That has drawn my attention to it more than anything else.

17,587. (*Mr. Caird.*) These printed instructions which you have placed in our hands, and which have been given you for your guidance seems to refer almost exclusively to oysters?—Yes, but there is another.

17,588. (*Mr. Lefevre.*) Have you ever seized any nets on account of their being illegal?—No, as I have said before, whenever a complaint has been made I have been unable to find the man who made it next morning.

17,589. Are you aware that the net used by the trawl fishermen here has a mesh of less than the legal size?—When I have inquired into the matter the men have told me that if I seized one net, I should have to seize the whole of them.

17,590. Then you are aware that all the nets used here by the trawlers are below the legal size?—I think so.

17,591. Yet there is no case within your knowledge in which the nets have been seized?—No, none.

17,592. (*Mr. Caird.*) Is the system of kettle net fishing used on this shore?—No, I have never seen it.

The witness withdrew.

P. Collins.

PHILIP COLLINS called and examined.

17,593. (*Mr. Caird.*) Have you long been a fisherman here?—More or less, from my youth.

17,594. What kind of fishing do you practice?—Trawling and mackerel and herring-catching. I was never seining, but I have seen plenty of it.

17,595. Can you speak from an experience and

BRIGHTON.

P. Collins.

7 Dec. 1863.

knowledge of 20 years of the place as a fishing station?—Yes.

17,596. Has the supply of fish on the whole increased or diminished during those 20 years?—It has diminished.

17,597. Has the number of boats increased or diminished?—Diminished.

17,598. Were there more boats engaged here in the fishing 20 years ago than there are now?—Yes, there were more larger boats. There are more smaller boats now for the herring-fishing than there used to be 20 years ago. I think there are fewer mackerel boats.

17,599. Are there fewer large trawl-boats?—The trawl-boats are about the same. I do not see much difference in them.

17,600. In what kind of boats has there been a decrease?—In the largest boats of all—about 30 feet long, and from that to 25 or 26 feet.

17,601. Are there fewer of those boats than there were 20 years ago?—Yes.

17,602. Has the whole catch of fish diminished?—Yes.

17,603. Is there any particular kind that more than another has fallen off?—No; I think there has been a falling off in the whole of the fishing.

17,604. What do you attribute that falling off to?—We attribute it in a great measure, in this bay, to the size of the seines with the mesh of a small scale. There are some small scale seines in this place that you will not get the shank of a pipe through the mesh.

17,605. Have they been used during the whole of time you refer to—during the whole of the 20 years within which your experience extends?—Yes.

17,606. Were they used before?—I cannot say; I believe they were.

17,607. Are you aware whether it has been an old habit to use seine nets on this shore?—I was talking to an old seine man some time ago. He has been engaged in seining all his life and he is about 60 years of age. There are about a dozen boats that go seining all the year through.

17,608. What is the name of that man who has been seining for nearly 60 years?—His name is Salvage. I was talking to him yesterday and he seems to be very much against the small scale seines.

17,609. Has there been any alteration in the size of the mesh of the seine in your experience?—I believe there has been an alteration. It has gone smaller in the bunt.

17,610. Smaller than it used to be?—Yes.

17,611. And therefore do you suppose that it is more destructive to the small fish?—Of course.

17,612. Do you think that there is a larger quantity of small fish caught now than in former years?—Yes, I believe there is, because the nets are much smaller than they were.

17,613. Have they much increased in number in recent years?—No, they are about the same in number.

17,614. There are about the same number employed now as formerly?—Yes; I see no difference at all.

17,615. Then on the whole there is no greater destruction of small fish than there used to be in former years?—I believe there is.

17,616. In what months of the year is that system practised?—They use them at times all the year round.

17,617. Are they not used more during some months than in others?—Yes.

17,618. What months are they?—In the autumn and spring.

17,619. And in the warmer weather?—Yes. When the mackerel are shoaling about and come into the bay they will put these small seines on one side and take to the mackerel seine.

17,620. Is that larger?—Yes, but not much. It is about the size of a pilchard scale.

17,621. Have you any notion what quantity of small fish will be destroyed in a day by the use of these seines?—No; the man whose name I mentioned to you says that he has destroyed some lasts of small herrings not longer than my finger—not longer than my little finger.

17,622. Are they not sprats?—No, he told me they were nothing but herrings.

17,623. You have not seen that done?—No, but I have seen a good many small fish destroyed. I can remember mackerel being sold here by the quart not longer than my finger.

17,624. Was the mackerel-fishing injured generally in that year by the destruction of small mackerel?—Yes, I believe it has been a great injury to it ever since.

17,625. Have the mackerel diminished of recent years?—Yes, but not all through the season. I think it has been caused by catching mackerel in the winter time. That is the reason they have been scarce in the summer time.

17,626. What time is the best for mackerel-fishing?—The old fishermen did not go till April, and they left off in June.

17,627. When do they go now?—Early in January, and they do not leave off until the latter end of August.

17,628. If they do that I suppose they find that it answers?—They made it answer at one time, but not lately. They catch the mackerel all in the north now.

17,629. Then it is not mackerel caught off your own coast, but caught somewhere else?—I think this place was a resort for mackerel once, and that they have now spread and migrated further off. I believe there is a native fish in every bay, and if they are destroyed you cannot catch them afterwards. I believe there would be a great many more fish if the mackerel were not destroyed here when young. There would also be more of what I call the native herring, if it were not for these small scale seines.

17,630. Can you yourself distinctly trace any injury to the deep-sea fishing to the destruction of the small immature fish by the seine nets?—We attribute it to that.

17,631. Can you point to any year in which you have particularly noticed a decline?—I believe it is the opinion of the fishermen that it has been getting worse and worse every year.

17,632. Have the fishermen been making a worse trade of it during recent years?—I believe they have.

17,633. On the whole, does not a boat get as good a fishing as it used to do?—No, and another thing is that they do more at it than they used to do.

17,634. (*Mr. Lefevre.*) Do a great many more hands go?—Yes.

17,635. (*Mr. Caird.*) I thought you stated at the commencement of your examination that there were fewer?—Fewer boats. I am not speaking of this place alone, but of others as well. There are more altogether that go fishing.

17,636. Then do you attribute the decrease to the greater number of men who are now fishing?—Yes, throughout the United Kingdom.

17,637. You are a trawl fisherman?—Yes, and a drift-net fisherman also.

17,638. Did you ever trawl in Rye Bay?—No; I have been herring catching there, and I have seen boats trawling in Rye Bay.

17,639. Where do you trawl?—At Brighton.

17,640. How far off the shore?—Sometimes 20 miles; sometimes only five or six.

17,641. Can you get as much fish as you got formerly?—No, we cannot, and we attribute it to the use of the small-scale seine.

17,642. You say you cannot catch as many fish on the ground on which you have been accustomed to trawl, and yet you have not found it necessary to go to other and fresh ground?—It is very seldom that we do.

17,643. Do the French fishermen come upon your ground?—Yes.

17,644. Do they continue to come in as great

numbers as they did formerly ?—Sometimes there are more on our outer grounds than there used to be.

17,645. Has there been a gradual or a constant increase of boats on that ground ?—I cannot say. I know nothing about that.

17,646. Do they on the whole get good fishing on the grounds you frequent ?—If we don't catch fish when we go out we try somewhere else, and they do the same.

17,647. You do not go far from your own ground? —No.

17,648. Do you ever go to the French coast ?—No.

17,649. Or to the Dutch coast ?—No.

17,650. Has the price of fish increased much in your time ?—No, it has rather lessened.

17,651. Do you not get as much for your fish now as you used to get ?—No, not nearly so much.

17,652. Have you any oyster-fishing here ?—Not since the ground was "ridded" of oysters. There used to be some good oyster-fishing between Shoreham and Worthing, but it has all been given up.

17,653. How many boats were there formerly engaged in that fishing ?—30 or 40 sail used to go to Shoreham and Worthing, seven or eight miles off. They dredged the beds continually year after year until they destroyed the spawn altogether.

17,654. Have they fished that ground out ?—Yes.

17,655. Are there no more oysters to be had on that ground now ?—No ; nothing to pay them.

17,656. Are there no regulations adopted for the purpose of protecting the oyster beds ?—No.

17,657. Have you yourself, as a fisherman, been interfered with in any way by the Coastguard officers or others as to the size of the mesh of your net, or the modes of fishing you adopt ?—No.

17,658. Does no one ever interfere with you ?—No.

17,659. Are you aware that there is a legal size for the mesh of your net ?—Yes.

17,660. Do you adopt that legal size ?—No, we do not.

17,661. You pay no attention to it ?—It is not enforced.

17,662. There is no legal restriction of any kind placed upon you ?—No, there is an Act of Parliament, but it is not enforced.

17,663. (*Mr. Lefevre.*) What is the size of the mesh you use in trawling ?—I think each side of the mesh will measure $1\frac{3}{4}$ inches. That will make $3\frac{1}{2}$ from the side bar.

17,664. Do you know that the legal size is $1\frac{3}{4}$ inches? —Yes, about $1\frac{3}{4}$ from knot to knot. Perhaps ours is not quite as large.

17,665. Then what is the size of the mesh you use? —Perhaps $1\frac{1}{2}$ or $1\frac{1}{4}$, somewhere about that.

17,666. Do you ever trawl close in-shore ?—Yes, two or three miles off sometimes.

17,667. Do you ever catch small immature fish with the trawl net ?—A very small number indeed. I never saw many. Sometimes we may get two or three about the size of your little finger.

17,668. You do not as a rule catch small fish ?—No, I do not remember ever catching half a bushel of small fry in my life.

17,669. Do you complain of any falling off in the trawl-caught fish ?—Yes.

17,670. As well as in other descriptions of fish ?—Yes.

17,671. Do you catch as many haddocks as you used to catch ?—No ; and there are more go to it.

17,672. Do you mean more here or more in the United Kingdom ?—More altogether.

17,673. More trawl-boats are employed in catching haddock than were employed formerly ?—Yes, there are more boats, and less large mackerel boats.

17,674. Have you observed whether there are more boats coming from other parts of the kingdom and fishing off this coast than formerly ?—No.

17,675. You have not observed that there are more boats coming from Torbay and trawling off here ?—No.

17,676. Do you observe a diminution in all classes of trawl-caught fish ?—We attribute the falling off in the trawling to the use of the small scale seines.

17,677. Do you observe a diminution in any one class of fish you catch by trawling more than in another ?—We think there is less caught than there used to be.

17,678. Do you catch fewer turbot or soles, or cod, or any particular kind ?—There are less of all kinds.

17,679. Are there fewer plaice than there used to be ?—Yes, they have fallen off in particular.

17,680. Are you yourself the owner of a boat ?—Yes, I have a small boat.

17,681. What is it used for ?—The herring-fishing, and it goes trawling at times.

17,682. What is the size of it?—It is not very large, about 10 tons.

17,683. How many men do you take in her ?—Three men and a boy. Only two sometimes.

17,684. How long have you owned her ?—22 years.

17,685. Do you observe whether you make a less income from that boat now than you used to do ?—Yes.

17,686. How far do you go off this coast for herrings ?—We catch them close in-shore sometimes, sometimes a mile or two off; at other times six or seven.

17,687. Do you meet other boats fishing where you go ?—No, only our own boats.

17,688. How may seine nets are used off this coast ? —Not more than five or six of a very small scale. There are more boats engaged in mackerel-seining.

17,689. When the mackerel season is on do they not use the small scale ?—No, they use one then of about an inch scale.

17,690. Does it pay to fish with the small mesh seine net merely to catch the small fish ?—I do not think it pays those who use them.

17,691. Do you agree with the last witness as to the proportion of large and small fish caught by the seine nets ?—No, I believe a great deal more small fish are caught than he mentioned. I think you will find that instead of one in six being small there is not one in 20 good.

17,692. Not one good fish in 20 ?—No, nor yet one in 100.

17,693. Would the fishermen here like to see the seine nets put a stop to ?—I believe the majority of the fishermen would.

17,694. Would it take away the means of obtaining a livelihood from a certain number of fishermen here ? —No, I believe it would benefit them in the end.

17,695. You do not fish with the seine nets ?—No.

17,696. Have you ever seen spawn brought up in the seine nets ?—Not to my knowledge. I have only seen small fry brought up.

17,697. You have seen the seine nets drawn in ?—Yes.

17,698. But you have never seen the spawn of fish in them ?—No.

17,699. What is the length of the small mesh seine net ?—They have somewhere about 40 yards in the bunt of the net as we call it.

17,700. Is it a much smaller net than the net used for mackerel ?—It is as small as the quill of your pen.

17,701. What is the length of the net ?—140 or 200 yards at the most.

17,702. What is the length of the largest net used for mackerel ?—200 or 300 yards, and there is a scale on that the size of the mesh of a herring net.

17,703. When did you first observe the diminution in the take of mackerel ?—I have not taken any particular notice of that.

17,704. Has there been a gradual decrease in the take ?—Yes.

17,705. Are most of the fish caught here consumed in Brighton itself ?—Yes, I believe so.

17,706. Is there no great quantity sent off by rail? —I believe not.

17,707. Do any boats from Hastings come in here with their fish ?—Sometimes the mackerel boats engaged in drifting will come in here, but not often.

BRIGHTON.

P. Collins.

7 Dec. 1863.

17,708. Do any foreign boats come in here to trawl?—There may be a Frenchman fish in here sometimes.

17,709. Are there any trawlers belonging to Shoreham?—I believe not.

17,710. They only fish for herrings?—Yes.

17,711. How do you pay the men who fish with you?—They go by shares.

17,712. How do you divide?—We divide into so many shares.

17,713. What proportion does each man get?—If they are trawl-fishing all get alike.

17,714. Do you, as the owner of the boat, get more than the others?—Yes, I get a little more.

17,715. What do you get more?—A share more; but not in trawl-fishing.

17,716. Do you get nothing more in trawl-fishing?—No; I take a share like the other men. I find the nets and boat, and so many men go in each boat.

17,717. Do you not set apart any thing for the boat?—That depends upon how hungry or dry we are.

17,718. Do you pay all the expenses first and then divide?—No.

17,719. Don't you set apart anything for the expense of the boat?—No, the owner takes his equal share like the men; but it is different in drifting.

17,720. You have had a bad herring season here?—Yes; I don't think the oldest man here can remember a worse.

17,721. Was it a good season last year?—It was a very fair season.

17,722. Do you think the mackerel are caught before they come here?—A great many of them. Before the boats used to go down to Plymouth they made good seasons here; but it has been getting worse of late years.

17,723. Do you think the mackerel that used to be caught here are now caught by other people elsewhere?—No; I believe they resort to the deep water for warmth, and go out of the shallow channel, and in the summer time and in warm weather they appear of late years to migrate further about.

17,724. Are the small fish caught in the seine nets sold on the beach?—Some of them, and some are thrown away.

17,725. Is there a large quantity thrown away?—A great deal that is not fit to come to the market. In fact some that they do sell ought not to be sold.

17,726. If the law said that only a certain sized mesh should be used would that put a stop to the catch of small fish?—Yes, if it was enforced.

17,727. Would there be any means of enforcing it?—I think the Government could as easily enforce it as they can enforce the laws against smuggling. It might be done by the same people.

17,728. (*Mr. Caird.*) Are you often prevented by bad weather from going to sea to fish?—Yes, very often.

17,729. Do you pay any attention to the signals hoisted now by the direction of Admiral Fitzroy?—We take notice of them, but if we think it is fit to go we exercise our own discretion.

17,730. Have you benefited by those signals?—Not much here. If the storm signal is flying and we think we can get to sea, we go. If we are forced to come back we come back.

17,731. Have you any harbours to run to?—Only Shoreham, and that is a tidal harbour.

17,732. You cannot get there at low tide?—No.

17,733. Would it be of great advantage to if you had a harbour to which you could run in bad weather?—Yes, it would be much better for every one. We could then go out in a gale of wind.

17,734. Would it be of great advantage to the fishermen employed in these waters if such a harbour were established?—I don't think it would.

17,735. You do not think so?—No.

17,736. Would you not catch more fish if you had a harbour to run to in bad weather?—I don't think so.

17,737. (*Mr. Lefevre.*) Do you pay the men on shore for dragging your boats up?—Yes; we have a horse to drag the boats up. He goes round a capstan.

17,738. What do you pay for that?—Two shillings.

17,739. Every time you come in?—Yes.

17,740. And when you go out?—Yes; some charge 3*s.*

17,741. What do you pay for going out?—One shilling and sixpence for small boats.

17,742. Do you ever take any ice out with you?—No, we never take ice.

17,743. How long do you stay out?—A couple of nights; two or three days sometimes. It depends on the fish we get.

17,744. Are you aware that the trawl-fishing off Hastings has improved very much of late years?—No, I do not think it has. I think it is about the same as here.

17,745. You do not think it is true that the trawl-fishing there has improved?—No; but they may have more drift-net fish.

17,746. But they say the trawl-fish has increased?—They get a great deal more plaice and gurnets than we do.

17,747. Do you ever go off Hastings from Brighton?—Sometimes.

17,748. Are their boats larger than yours?—Yes.

17,749. Do they keep the sea longer?—I do not think they do.

17,750. Can they keep the sea in rougher weather than you?—No, I do not think they can.

The witness withdrew.

J. Andrews.

JOHN ANDREWS called and examined.

17,751. (*Mr. Caird.*) Have you long been a fisherman here?—For 30 or 40 years, and I have been as much at it as any man in Brighton.

17,752. Have you within your experience observed whether the number of boats and fishermen employed here in fishing, has increased or diminished during that time?—I believe that more go to the fishery now. I am speaking now of those seine nets.

17,753. But I mean the fishery of every description?—It is the watermen who go out pleasuring who go with the seine nets. If they see a shoal of fish coming in after food, they will shoot their nets and round them for 200 or 300 yards, and then lug them all up on the beach. There are a great number of small fish with them. I have seen mackerel drawn up not as big round as the shank of a pipe.

17,754. But has not that system of seine-fishing been practised here ever since you have been engaged as a fishermen?—Yes, but it is practised more now than ever it was.

17,755. It is practised more now than it was then?—Yes. They stop all the red mullets not as big as your little finger. Now the drift net would never catch anything of that sort, nor the trawl net. They go out in the middle of the sea trawling, and away down far in the north.

17,756. Have you ever trawled in Rye Bay?—Yes, I have been trawling there for nine or ten years.

17,757. Have you trawled there in recent years?—Yes.

17,758. With your own vessel?—Yes.

17,759. Have you found that the grounds there are not as productive of fish as they were formerly?—Nothing like it; no more are any of the grounds round about here.

17,760. Have you ever, in consequence of finding fewer fish, changed your fishing ground?—The fishermen are always changing their ground. They cannot get as much fish on the rough ground as they can with

the seine nets. The rough bottom tears their nets and everything they have.

17,761. Do the trawl-boats make a worse fishery than they did formerly ?—Yes.

17,762. Do the trawl-boats not bring as many fish ashore on the average as they did ?—No.

17,763. Has any particular kind of fish decreased ?—Yes, turbot, brill, doreys, cod, mullet, and whiting.

17,764. Do you attribute the whole of the injury done to the fish to the use of the seine nets ?—Yes ; I do not believe that any blame is attributable to the drift nets.

17,765. What remedy would you adopt in order to get rid of the evil ?—I believe that the people round Scotland have been petitioning to have these nets abolished.

17,766. They do not complain of the seine nets in Scotland. What they complain of is the trawl-fishing. Do you complain that the trawl-fishing is injurious ?—I think they use a smaller scale of mesh in the trawl net than they used formerly.

17,767. You think the mesh of the trawl net is not so large as it used to be ?—No, not so large as they used to have them.

17,768. Have the meshes of the trawl net been much smaller of recent years ?—Yes.

17,769. When did the change take place ?—For years one has been making it smaller than another.

17,770. What is the size of the mesh of the trawl net ?—Two inches ; it is not more.

17,771. Two inches from knot to knot ?—Not so much. About an inch. It is about a half-crown size. We used to call it a half-crown mesh from knot to knot.

17,772. When did the fishermen begin to diminish the size of the mesh ?—I don't know. Some have reduced it more than others.

17,773. Then do you think that injury has been done to the fishery by the small mesh of the trawl net as well as by the use of the seine net ?—No, I don't think that. They bring all their fish to market. They don't catch small fish like the seine nets. If there is a shoal of fish coming on, the seine nets are taken out in the mackerel boats and fish of all sizes will be hauled ashore. I have seen small turbots drawn up not so big as a half-crown piece, and plaice of the same size. Along Dungeness and Rye Bay they have carried them away by waggonloads. They go down with carts and waggons to the beach and cart the small fish away.

17,774. What quantity of fish on the whole is caught by the seine nets at Brighton ?—I cannot say. I have not been to look after them. I have never interfered much with them.

17,775. You have never been a seine-net fisherman ?—Never in my life.

17,776. Do you think that if the system of seine-net fishing were entirely prohibited it would be of advantage to the fishery generally ?—In my opinion it would.

17,777. Would it not deprive a good many people of their means of livelihood ?—No ; I think it would be better for them in the course of time.

17,778. What other business could they look to ?—They must take up something else. They would not go out with parties off here pleasuring. The people who do that call themselves fishermen, but I don't.

17,779. Are the pleasure boats much used for seine-net fishing ?—They are the parties who follow it so very much.

17,780. Are we to understand that a great portion of the seine-net fishery is carried on by the pleasure boats, and by people in pleasure boats ?—Yes, by parties who go out pleasuring.

17,781. And not by the fishermen ?—No. The fishermen are generally away in the large boats. They will be away down at the Land's End, or at Yarmouth, and Lowestoft, and other places.

17,782. Is there not a certain class of fishermen engaged in the seine-net fishery ?—Yes. They are glad to get any one to engage in that at times. Many of them who are employed at it are not worth anything.

17,783. Do you catch any good cod here with the hooks and line ?—I have seen bushels and cartloads brought ashore here by the seine nets not weighing half a pound. I have also seen red mullets brought in only as big as your finger. Now they are a very fancy fish are red mullets, yet what good can they be when they are only as big as a bit of the shank of a pipe. I have seen lots of them and mackerel also hauled ashore and trampled upon.

17,784. Has the practice of seine-net fishing been greatly on the increase in recent years ?—Yes, a great deal. We never used to see such things as we see now.

17,785. But there has always been seine-net fishing here as far back as the memory of man can go ?—There has been here and there one ever since I can remember.

17,786. But it has much increased ?—Yes.

17,787. It is now much practised by the pleasure boats ?—Yes.

17,788. By people who are not fishermen at all, but who go out for the sake of amusement ?—Yes.

17,789. Do they take some fishermen with them with fishing nets ?—Yes, and I have known the trades-people here have seines of their own and get fishermen to go with them.

17,790. Do they get much fish by that means ?—Sometimes they do with the mackerel seines. They go out with these merely as a hobby.

17,791. Have you ever been interfered with in any way as a fisherman by the Coastguard, or the Custom-house officers, or any officers appointed by the Government as to the size of the nets or the mode in which you should fish ?—Yes. There have been orders against these seines for many years. There has been a law in existence. If any person has gone down and spoken to the Preventive man he has been obliged to go and take the nets. That law has been in existence for years, in the same way that there have been laws against our going across the water and bringing brandy tubs ashore. But of course they will not hurt you if they don't catch you. It is like a man robbing a house. He will not be hurt if he is not caught.

17,792. Then has not the law been enforced here ?—There is a law but it has not been enforced. I believe there is a law against the use of these seine nets.

17,793. (*Mr. Lefevre.*) Have you ever caught any of these small fish with the trawl ?—Very few.

17,794. How near the shore have you fished with the trawl ?—Within two miles, and sometimes nearer. Perhaps sometimes we might be within half a mile.

17,795. Is that frequently the case ?—No ; we generally go out in mid-channel, about 20 or 30 miles off.

17,796. But at times you have fished close in-shore ?—Yes, sometimes.

17,797. Have you never caught any of these immature fish in-shore ?—No ; the trawl never injures any. All the injury it does is in parting the drift nets. Sometimes we tear their nets.

17,798. You have never caught immature fish in the trawl net ?—No; I do not think that any trawl about these parts ever did.

17,799. Are you aware that complaints have been made at Hastings of the trawl fishermen catching small fish ?—No, I don't believe that anybody in the county of Sussex has made any complaint with regard to the trawl nets, nor yet in Kent, nor yet down off Torbay or Plymouth.

17,800. Are your trawl nets about the same as the trawl nets of the Hastings boats ?—Yes.

17,801. About the same sized mesh ?—Yes, or perhaps rather bigger mesh.

17,802. Is the beam of the trawl about the same ?—Yes, about the same; but it varies according to the size of the boat. Some will have then 24, 25, or 26 feet. If you have a boat 30 feet you may want a beam a little longer.

BRIGHTON.

J. Andrews.

c. 1863.

17,803. What do you call the bay from Beachy Head to Selsey Bill ?—Brighton Bay.

17,804. Is it mostly smooth ground ?—Mostly.

17,805. Is it rocky in some places ?—Yes, a little.

17,806. Can you trawl within a mile of the shore ?—Yes, right across to France.

17,807. Do many of the boats trawl within a mile of the shore ?—At times ; in the winter time they generally go further off.

17,808. Are there many seine nets used on this coast besides those used just off Brighton ?—I do not think there are many ; they work the seines when the mackerel come in ; then they haul them up.

17,809. Taking the coast from Beachy Head to Selsey Bill, are there any seine nets used ?—Yes, down at Mount's Bay, at the Land's End, there are.

17,810. I am talking of between Beachy Head and Selsey Bill. Are there any seine nets used along the coast except at Brighton ?—I believe there are.

17,811. Is there much ground where the seine nets can be used ?—Yes.

17,812. I believe they cannot be used except on smooth ground ?—No.

17,813. Then, is there much ground on which the seine nets can be used, except on the beach at Brighton ?—Sometimes they get entangled here ; they get hold of the rocks occasionally.

17,814. Can you form any opinion as to the number of seine nets used between Beachy Head and Selsey Bill ?—No.

17,815. Do you think there are many except just at Brighton ?—No ; there are a few I think at Seaford, and in one or two places along the Sussex coast I believe they use the seine nets.

17,816. Have you ever been employed in seine-fishing ?—Never in my life.

17,817. Have you ever observed the nets when they have been brought in ?—I have seen them hauled ashore.

17,818. Have you ever seen spawn brought up in them ?—I have seen a great deal at times, and also large quantities of small fish.

17,819. Have you ever seen much spawn ?—I have never been down to see much about it.

17,820. Then you cannot say whether spawn has been drawn up or not ?—No.

17,821. You have never seen it ?—No.

17,822. Have you been to see what the small fish are ?—Yes ; I have seen small mackerel among it—terribly small.

17,823. You have seen that yourself ?—Yes, I have seen cartloads brought in of no use to anyone.

17,824. What particular kinds of fish are included among the small fish ?—It contains all kinds of fish.

17,825. Are there small soles amongst it ?—Yes, soles, turbots, brills, and plaice.

17,826. Are there any herrings ?—Yes, codfish, and herrings, and mackerel too. There is nothing that they do not bring ashore. I have no doubt that in summer time all these fish come close in to spawn as the salmon do in the rivers.

17,827. Are any salmon caught off here ?—Hardly one.

17,828. Are any salmon trout ?—Sometimes they catch a few in the mackerel net the same as mackerel.

17,829. Do you think that any regulation as to the size of the net would prevent the catch of small fish ?—We think so. We have always made a complaint about it.

17,830. Supposing there was a legal mesh established of a larger size than that now in use, would it prevent the catch of small fish ?—I think the seine nets should be done away with altogether.

17,831. Is there a considerable quantity of mackerel caught with the seine nets ?—Yes.

17,832. And of other fish as well ?—Yes, at times.

17,833. Then would not the putting a stop to seine net fishing put a stop to the catching of these fish ?—Certainly it would, if the seining were put a stop to.

17,834. Have you ever heard any complaint from the seine fishermen themselves as to the catching of small fish ?—No.

17,835. What is the cost of a seine net ?—It all depends on the size. I never had any dealing with seine nets.

17,836. Do you not know what the cost of a seine net is ?—No.

17,837. How many men does it take to pull in a seine net ?—Sometimes four or five, but they get helpers to help them in the people who may be standing by on the shore. I have seen tradesmen go down and assist in hauling the nets right on to the beach.

17,838. Have you observed any increase in the number of seine nets used now as compared with what were used formerly ?—There are more mackerel seines. If they see a shoal of fish 30 or 40 yards off they sweep entirely round them, and haul them on to the beach. It does not signify what fish they are.

17,839. Do they catch any sprats off here ?—Sometimes.

17,840. Do they catch them in seine nets ?—Sometimes they go drifting with the drift nets. The fish get entangled by the head in the mesh.

17,841. Has there been a diminution in all other kinds of fish caught here as well as mackerel ?—I believe there has. I think there would be a great many more if it were not for the seine nets.

17,842. Have you yourself given up fishing ?—Yes.

17,843. For how many years ?—10 or 12 years.

17,844. Are you the owner of more boats than one ?—Yes.

17,845. How many ?—Three. I have two down at Yarmouth ; they go down to the Land's End, and from there to Yarmouth.

17,846. How long have you had these boats ?—35 or 36 years.

17,847. Do you find that you make less by them than you did before ?—Yes.

17,848. For how long have you observed that ?—The business has got worse and worse every year.

17,849. Have you bought a boat lately ?—No.

17,850. When did you last buy a boat ?—It is about six years since I had a new one.

17,851. Did you observe any diminution in the takes of fish before that time ?—Yes, at times. We cannot tell what is the cause, but I think it is going fishing so much at Christmas. At one time we never thought of going mackereling before May, and left off in June. Now they go from Christmas up to August, nearly all the year round.

17,852. Were the fish decreasing then in the same way they are now ?—We have always been fancying that there have not been as many mackerel year by year. We have had no good mackerel season here for years.

17,853. Then do you think the mackerel have left this coast for years ?—I don't know.

17,854. Is your principal fishing for mackerel far out ?—Yes, 30 or 40 miles from here.

17,855. Are the mackerel you catch here always off the coast or do you think they come from a distance ?—I cannot answer that question. They come in according to the weather. If there is calm weather they come in.

17,856. Do you think they migrate ?—Yes.

17,857. Had you only two boats before you bought your last one ?—I have had two or three here for the last 30 years. Sometimes they have been down at Scarborough, and at places down in the west, round by the Scilly Islands, or the Land's End.

17,858. Do they go trawling ?—No ; they are only drift-net boats for catching herrings and mackerel.

17,859. Can you say what is the proportion of small fish caught in the seine nets ?—No, I cannot.

17,860. Do you agree with the gentleman just examined that it is only one-sixth of the whole catch ?—I cannot say. It would puzzle anybody to answer that question. As to its being one in six, I should say there are only one in 100 that are good.

17,861. I think you said you have not been down to

BRIGHTON.

J. Andrews.

7 Dec. 1863.

see the seine-net fishing?—No, I seldom go down to see it.

17,862. You only form your opinion from seeing cartloads of small fish brought in?—Yes. I have known small mackerel brought in by cartloads and waggonloads of no use to anyone.

17,863. Are not these small fish sold?—No. A great many are trampled upon and thrown into the sea. They are not big enough to sell. They sell them by the pint, so you may judge by that what size they are.

17,864. Are the fish that are carted away, sold?—Yes, but what they bring at the market I cannot tell. They are wonderfully small. Mullet is a dear fish at times, but I have seen them brought in not as big as my finger. I have also seen codfish caught in the seines that would not weigh more than half a pound each.

17,865. Is there much fishing here for cod with the hook and line?—When it will pay people to go, there is. There would be more fishing, but there are none to be caught.

17,866. What bait do they use here?—Herring, mackerel, sprats, according to the season.

17,867. Do they use shell-fish of any kind?—Shell-fish?

17,868. Yes—mussels?—Sometimes, but there are only very few about here.

17,869. Do the line fishermen complain of the trawlers coming across their lines?—I don't know.

17,870. Do they fish with the long-line or the hand-line?—With both.

17,871. What distance from the shore do they fish?—Two or three miles.

17,872. What length of lines have they?—200 or 300 fathoms; from that down to 100 fathoms, and 400 or 500 hooks.

17,873. Is there any complaint here on the part of the fishermen against the trawlers for cutting their nets?—Yes, great fault has been found with that sometimes.

17,874. Have you yourself lost any nets?—Yes, very often, especially in the mackerel season.

17,875. Have you recovered anything from the trawlers who did the damage?—No, I can never find who they are. They get in among our nets in the night time, and they will be gone before we can get hold of them. You can never get at them. Perhaps we may have two miles of net out when they come in among them. They tear them very much.

17,876. Do the French fishermen come here?—Yes, often.

17,877. And the Torbay boats?—Yes, from Ramsgate; four or five of them at times.

17,878. Do they trawl in this bay?—Yes, but very seldom. We may have three or four at a time, and they stop for a few weeks.

17,879. That has only been of late years?—Yes. We never had as many as we have now, but we don't get many even now.

17,880. Then there has been an increase in the number of trawlers fishing in this bay?—Yes, but I do not think it will pay them to come here.

17,881. Nevertheless they do come?—Yes, at times; but it won't pay them.

17,882. Then there has been an increase of trawlers in this bay?—At times, but there are only very few. I do not think that what the smacks take hurt the small fish.

17,883. (*Mr. Caird.*) Do you ever fish on the Dutch coast?—No.

17,884. You say that no injury is done to the small fish by trawling?—No.

17,885. Do you ever get spawn in the trawl nets?—No.

17,886. Would you say it is incorrect to state that the brood is injured by trawl-fishing?—There are some people who have made complaints, but we have never made any complaint about it here.

17,887. You do not attribute any of the falling off you have experienced to the use of the trawl net?—No, not to the trawl net.

17,888. Nor to the number of fish caught by the trawlers?—No.

17,889. You do not think that diminishes the catch?—No.

17,890. (*Mr. Lefevre.*) Do you think it would be an advantage if the trawl fishermen here were prevented from fishing within three miles of the coast?—That would be according to the time of the year.

17,891. Would it be injurious to them?—I cannot say.

17,892-3. Cannot you form any opinion upon that point?—No, I cannot say.

17,894. You have yourself been a trawler?—Yes, a good many years ago.

17,895. Have you often trawled within three miles of the coast?—Yes, I have been trawling within a mile.

17,896. Do you think it would be injurious to the business of the trawlers if trawling within three miles of the coast were put a stop to?—Many a time the fish get in here close aback of the shore rocks.

17,897. Would it diminish your take of fish very much?—I think it might, but generally speaking there are not as many fish to catch as there used to be.

The witness withdrew.

JOHN WRIGHT called and examined.

J. Wright.

17,898. (*Mr. Caird.*) Are you a fish salesman at Brighton?—No, I am a fishmonger.

17,899. Have you been many years a fishmonger?—About four years.

17,900. Have you had any previous experience of the fishing trade at Brighton?—Yes.

17,901. As a fisherman?—Yes.

17,902. For many years?—Yes.

17,903. Have you, in the course of your experience, observed whether the total catch of fish off Brighton has increased or diminished?—It has diminished, I think.

17,904. Has any particular kind of fish diminished more than another?—Soles, in particular, have, I think.

17,905. When did that diminution first begin to exhibit itself?—It has been going on for some years past, but more so during the last five or six years.

17,906. Has any other kind materially decreased?—They do not seem to have decreased. There are as many mackerel as there used to be, but a number of years ago they used to try for them a great deal more than they do now. It is very rarely now that we can get any of our mackerel boats to go into the Channel.

17,907. (*Mr. Lefevre.*) What is the reason of that?—They go to Plymouth and to the west country, where they think it answers their purpose better.

17,908. (*Mr. Caird.*) The same boats that used to fish formerly in the Channel now go to the west?—Yes. Only a few boats go into the Channel at all.

17,909. Your boats go to the west?—Yes, principally.

17,910. Because they can get better fishing there?—Yes.

17,911. Do you attribute the falling off of the fishing to any particular cause; say, for instance, the decrease in soles?—With regard to soles and most fish, I think a good deal depends on the use of the seine nets. I think they do a great injury.

17,912. Have you ever fished with a seine-net yourself?—Yes.

17,913. What proportion of the fish caught by the seine nets are small and immatnre?—A very great proportion.

17,914. Can you state what the proportion is?—I cannot state the exact proportion. Different small fish

BRIGHTON.

J. Wright.

7 Dec. 1863.

are caught, such as small soles, little brills and turbots, and small mullets.

17,915. Are they so small as to be of no value for any purpose?—They are of very small value.

17,916. Have you observed, at any particular time, what quantity of the whole catch of a seine net would be so small as to be useless for food?—Perhaps a few bushels.

17,917. A few bushels in one take?—Yes.

17,918. How many bushels would there be in the whole take?—Perhaps they would not get more than 10*s.* worth that would be really of value. I never saw any large catches of small fish. A bushel, however, would be a large catch. I have heard of the fishermen making many hauls of small mackerel and other fish.

17,919. Have you any idea of the number of seine nets that are used on this shore?—Guessing at it, I should say a dozen.

17,920. A dozen altogether?—Yes.

17,921. How many people are engaged altogether in the seine-net fishing?—There are about four to each net.

17,922. About 50 men altogether?—Yes.

17,923. Do those men not go to fish in any other way; are they exclusively seine-net fishermen?—It is only at a particular time that they go to this seine-net fishing. They are men that go to sea, and do odd jobs at other times.

17,924. The same men?—Yes.

17,925. Is it during the summer months that the seine-net fishing is generally practised?—Yes.

17,926. Is it not practised all the year round?—Yes, when they can use the seine net.

17,927. As a fishmonger, do you ever sell these small fish?—No.

17,928. They never come to you at all?—No.

17,929. I presume they go into consumption among the poorer classes?—There is even very little of that. I think they are destroyed in some way. Some are thrown away, some given away. They are disposed of in some way.

17,930. Then it does not pay to catch them?—No, it does not pay.

17,931. Are not the seine-net fishermen paid for what they do?—Their catching these small fish is quite unavoidable. Their scale is too small and when they get the fish in the net they must pull them ashore

17,932. Of the whole quantity they catch is it a fact that a considerable proportion is good fish?—Yes.

17,933. Does that come through your hands as a fishmonger?—Yes, the good fish come to me.

17,934. What proportion of the whole of the fish caught in the summer months off the shore at Brighton is seine-net caught fish, trawled fish and hook and line fish? Is one half of the whole of the fish caught in the summer months caught in the seine nets?—I cannot say; and, unfortunately, to-day most of the fishermen are at sea. There is one proprietor of seine nets here, however. I have a seine net of my own, but I think the small scale does an injury to the small fish when the net is pulled ashore.

17,935. The small mesh of the net?—Yes.

17,936. What size is the mesh of the net?—Many of the nets have a very small mesh indeed. In some of them at the bunt you would not get your little finger through.

17,937. So that the small fish cannot escape?—No.

17,938. Do you think it would be of advantage if that kind of fishing was prohibited here?—I do.

17,939. Would it not be attended by any disadvantages of a serious nature?—I think not. What they make by that mode of fishing is not really a consideration to the few who get it.

17,940. During the whole of the time it is practised you think there are not a sufficient number of fish caught to make it a matter consideration to them?—I do not think it would be a matter of consideration to them if it was prevented.

17,941. And yet you yourself say that there are considerable quantities of good fish caught by the seine nets?—Yes.

17,942. Suppose the system of seine-net fishing were entirely prohibited, that description of good fish would not be caught?—No.

17,943. Would that not diminish the supply of fish to the market in Brighton during the season?—Yes, but I believe it would be much better for the whole of the seine-net fishermen. I wish well to the fishermen and I want to benefit them if I can. I am sure that at present the seine nets destroy small fish in great numbers; but if the nets were confined to a certain scale then those fish would escape before they got them to the shore.

17,944. Then your objection is not to the use of the seine nets, but to fishing with too small a mesh?—Yes.

17,945. You desire to have the size of the mesh enlarged?—Yes.

17,946. You do not wish to prohibit the fishing by seine nets altogether?—No.

17,947. Have you considered what would be a proper scale to adopt?—I do not think they ought to be less than an inch from knot to knot.

17,948. The same as the herring net?—Yes.

17,949. Then do you think that the whole objection which is held by the other fishermen of Brighton would be satisfactorily obviated by a regulation which would fix the size of the mesh of the seine net and not by the prohibition of seine-net fishing altogether?—I believe so.

17,950. And you yourself would recommend an inch scale as the proper size?—Yes, I do not think they would do any injury then.

17,951. As a fisherman, have you observed whether the total quantity of fish brought ashore here by all the modes of fishing has increased or diminished?—I think it has diminished.

17,952. Does that show the necessity for supplying the market from some other place?—We have more boats here now than we ever had.

17,953. I am speaking of all kinds of boats and all kinds of fishing?—The boats have increased.

17,954. Has the total catch by all modes of fishing increased or diminished?—Diminished, I believe.

17,955. Then are you unable to supply the market of Brighton with fish to the extent you formerly were?—Yes.

17,956. Do you find it necessary to supply the vacancy by getting fish from some other place?—Yes.

17,957. Do you import more fish from London and other places than you did formerly?—Yes.

17,958. Do you bring any fish from London now?—Yes, great quantities.

17,959. Did you not do that formerly?—Occasionally, but not so much as now.

17,959*a*. I suppose there is a larger consumption in Brighton now?—Yes.

17,960. The number of people has largely increased?—Yes.

17,961. Then it would not be a just conclusion to measure the diminution in the take here by the quantity brought into Brighton from other places?—No, it would not. I do not think myself that the seine nets are the sole cause of the diminution in the fish.

17,962. What is the other cause?—I think the trawl net has something to do with it.

17,963. The deep-sea trawl?—Yes.

17,964. In what way?—I think the scale is too small.

17,965. You would regulate the size of that also?—Yes.

17,966. What is the present size?—It is very small, smaller than 1½ inches I think. They ought to be 1½, but they are a great deal smaller than that. I am in the habit of going on the beach every morning of my life, and of seeing the fish landed. This summer I have witnessed, I am almost afraid to say the

amount of small soles which have been brought in by our Brighton trawlers.

17,967. Do your Brighton trawlers use a smaller mesh than the larger trawlers?—I don't think they do. I have seen quite as small fish brought in from the London market. I have seen little bits of soles brought in by bushels from London not larger than my hand.

17,968. Are they saleable?—They are sold at some price or other, but it is very low.

17,969. Do any of the trawlers throw fish overboard in consequence of its being unfit for sale?—I do not think they do. I think they bring it all in when they have got it, and make the most of it.

17,970. Do they ever get any spawn in their nets?—I think not.

17,971. What should be the size of the mesh used by the deep-sea trawlers of the smaller kind?—1½ inches. It is in the summer months that they do the injury.

17,972. Do they trawl then in shallow waters?—Yes.

17,973. The injury is not done by trawling in deep water?—No.

17,974. When do they do that injury?—In the summer months. If they would not come within seven fathoms of water I do not think they would do any injury.

17,975. Then all the injury in the summer months you think is done by trawling in shallow water?—I do.

17,976. You do not think it necessary to adopt any small or regulated size of mesh for the trawls used in deep water?—Yes, I think they ought to be confined to a certain size. It should be a larger scale than is used now in the "poke" as we call it.

17,977. Do you think it right that regulations should be enforced, both with regard to the size of the trawl nets used in deep and in shallow water?—Yes, I do.

17,978. Would the fishermen themselves reap an advantage from that?—I think they would; I think it would be to the general good, and that they would very soon all see it.

17,979. It is only in the summer months that they do trawl in-shore?—Yes, in the summer months. I do not think it would be of much consequence in the winter. I am sure the bushels and bushels of little brills and turbots and soles I have seen this summer is something fearful.

17,980. And they have all been caught in-shore?—Yes, close in-shore. In the winter months I do not think it signifies.

17,981. If some regulation were adopted by which trawling would be prohibited within the headlands, do you think that would obviate the evil?—If they were not allowed to come within seven or eight fathoms of water it would benefit the fishing.

17,982. (*Mr. Lefevre.*) How many boats go out after the mackerel from here?—About 24 or 25; perhaps 30.

17,983. They go now further west, off the west coast?—Yes.

17,984. Off Plymouth?—Yes, they do try here occasionally, but not as much as they used to do. They begin the mackerel season earlier now. A few years ago they did not think of beginning it until much later.

17,985. They begin the season earlier now they go to the westward?—Yes.

17,986. Do they take the mackerel to Plymouth or to other ports westward?—Yes, wherever they can find a market.

17,987. They do not fish now off the Channel here?—Not so much. They do occasionally, but they do not give it a fair trial.

17,988. There are not the same number of boats bringing mackerel into this place as there were formerly?—No.

17,989. That comes from catching mackerel elsewhere, and taking them to other ports?—Yes.

17,990. Do you think it would be worth their while to fish for mackerel off here?—I cannot say; we have had a great number of mackerel off here occasionally; I have known immense quantities within half a mile of the shore.

17,991. Has anybody fished for them?—They are caught with the seines; they could not catch them with their drift nets.

17,992. What is the reason of that?—Not in shore; they have tried over and over again, but it is very rarely that they catch them with the drift net.

17,993. Cannot they catch them?—They can, but it is very rare that they can take them at night; they keep to the bottom.

17,994. Then unless you used your seine net on the shore your take of mackerel would be greatly diminished?—I think it would; I believe if they were not caught in the seine net they would not be caught at all, because the drift-boats have tried it over and over again, and they have not succeeded.

17,995. Then do you believe that the whole take has diminished or not?—I think it has.

17,996. Including the mackerel which they catch to the westward?—Yes, I think it has.

17,997. Have you any means of forming an opinion as to the quantity caught?—I used to go a good deal to Plymouth myself mackerel fishing, and I think we got more than they do now; we thought nothing of getting 8,000 or 10,000 in a night.

17,998. Are there more boats employed in fishing off there now?—About the same; perhaps there may be more.

17,999. How far along the coast are these seine nets used?—I believe right down to the Land's End.

18,000. But between Beachy Head and Selsey Bill, are they only used at Brighton?—They have them at Worthing.

18,001. Anywhere else?—At Bognor, I believe.

18,002. Is it only at certain places that they can be used?—I think they are used at Seaford, to the eastward. I do not know of any other places at which they could use the seine.

18,003. Are there any means by which you could enforce the use of a particular mesh?—I think it could be enforced; I believe you would find that the men would fall in with it if it were properly put to them.

18,004. You say that the catch of small fish does not pay the seine-net fishermen?—No, it does not.

18,005. Then would it not be worth their while to fish with a larger mesh instead of a small one?—Yes, I believe it would.

18,006. Do you agree with the previous witness, that there are two sorts of meshes used now, a small one and a large one?—I believe that the mesh of the seine net is too small, and also the mesh of the trawl net.

18,007. We have heard that there are two sorts of seine nets used off this coast, one with a large, and the other with a small mesh?—Yes.

18,008. You say that the catching of small fish does not pay the fishermen?—No.

18,009. Then can you give any reason for the use of the small mesh?—They expect to catch large fish with it as well as small.

18,010. But do they not catch the large fish in the larger seine?—Yes; but they look for smelts and large fish as well in the smelt nets. They might catch them by staking their nets.

18,011. Would they not get a large number of immature fish by using nets of that description?—Only smelts. The other would not go into the net; they would not have power enough to mesh themselves in a stake or a drift net.

18,012. Is the net you are speaking of the kettle net?—No, I do not think there is a kettle net in the place.

18,013. Is there much shrimping off this coast?—It has fallen off very much.

18,014. Do they catch many small immature fish in the shrimp net?—A good many.

BRIGHTON.

J. Wright.

7 Dec. 1863.

18,015. Could that be put a stop to by any regulation as to the size of the mesh?—It depends on the time of the year.

18,016. Would you put a stop to shrimping at a particular time of the year?—Yes.

11,017. At what time of the year?—If they start any time after March they will do no injury.

18,018. What is the time when most shrimps are caught?—From April all the summer through.

18,019. Is the summer the principal season for shrimping?—Yes.

18,020. Would you put a stop to shrimping during the summer months in order to prevent the catch of small fish?—It is rather difficult to understand that.

18,021. Would you put a stop to shrimping in the summer months in order to prevent the take of immature fish?—I think you might catch the shrimps without destroying immature fish.

18,022. How would you do that?—By employing men who like to go into the water with the shove nets. The nets I am speaking of are used like a trawl net.

18,023. You would only have shove-nets used?—No.

18,024. Would they catch small fish?—Yes; but they would not destroy them. The fishermen would take out the shrimps and then turn the bottom of the net over, so that the small fish could again get back into the water uninjured. The trawl brings in everything, weeds, and shrimps, and everything, and by the time the net is cleared of shrimps the small fish will be dead.

18,025. The small fish would be caught in the shove net, but they would be thrown in again?—Yes; they would not shove far before they would pull up. Perhaps they might get a handful of shrimps, and they would throw the others away.

18,026. Are there a good many boats employed in shrimping with trawls here?—Yes.

18,027. How many?—A dozen or fourteen.

18,028. Such a regulation as that would prevent the use of boats for that purpose?—Yes.

18,029. Is that desired by the fishermen here?—I think they would not like it at first.

18,030. Are you aware that the legal mesh for the trawl net is an inch and three quarters?—I believe it is.

18,031. And that the trawl net used here has a much smaller mesh?—It is much smaller.

18,032. Has there ever been any attempt to enforce the regular mesh, so far as you are aware?—Not that I am aware of. Some few years ago there was some chat about it, but it was never enforced in any way.

18,033. Have you noticed any falling off in the herring fishery here?—That seems to fall off too.

18,034. Is that owing to the herring boats going further off and taking their fish to other markets?—No, I think not.

18,035. Is it the fact that the herring boats do go to a great distance?—Many of them go as far as Yarmouth and Scotland.

18,036. And do they take their fish to the ports there?—Yes.

18,037. Did they formerly bring it in here?—Not that class of boats. They are boats especially for that purpose.

18,038. Has there been an increase in the number of boats here?—Yes.

18,039. Has there been any diminution in the boats that go off to the Channel and bring their fish here?—We seldom have boats that go into anything like deep water at Brighton. Our home boats are very small.

18,040. Except in a very good season, it hardly pays for the small boats to go out?—It is very bad this year, very bad.

18,041. With regard to the trawling in-shore, are there any means by which the trawlers could be prevented from coming within a certain distance of the shore during certain months of the year?—If it could be done it would be of benefit, but I don't see how it could be done.

18,042. Have you ever formed an idea as to how it could be done?—It could only be done by having the lieutenant in command of the Coastguard out at a distance in front of the town at which they were fishing. He would be able to tell whether the boat was within her distance or not.

18,043. That would only prevent injury in front of the town?—No.

18,044. But trawling in-shore would do injury all along the coast, would it not?—Yes, but I think if you imposed a larger sized scale, the boats would not come in-shore to fish.

18,045. You have not formed any idea as to how this injury is to be prevented of fishing within a certain distance of the shore?—No.

18,046. Does trawling here take place by day or by night?—By day and by night too.

18,047. Do many boats come from a distance to trawl here?—Not many; they used to come, but the fish have diminished. They do not come here much now.

The witness withdrew.

J. Salvage.

JOHN SALVAGE called and examined.

18,048. (*Mr Caird.*) Are you a seine fisherman?—Yes.

18,049. Have you been for many years a seine fisherman?—I have been seining for 40 years with a draw net.

18,050. Have the number of people employed in fishing with the seine net increased within your experience?—Yes, my own have; I have had eight hands at a time.

18,051. Are there more persons fishing with the seine nets than there used to be?—Yes, there are very nearly 100 hands after the mackerel in the summer time.

18,052. Do you catch any small immature fish that are unfit for the market?—I have been catching waggon-loads, and as for herring, I have been catching them out of number by waggonloads.

18,053. What do you do with them?—I let them remain on the beach, and they die.

18,054. That will not pay?—No, it will not.

18,055. Then why do you do it if it don't pay?—We shoot after a mullet or a bass.

18,056. Who do you sell your fish to?—To people at the market on the beach.

18,057. Is there a large quantity of the fish you bring ashore that you cannot sell at all to anybody?—We never bring that sort down on the beach.

18,058. What do you do with it?—Anybody picks it up and eats it who likes, or they let it lie.

18,059. Is there much that you get nothing for out of the whole catch you bring in?—Yes, at times.

18,060. Is there one-half of it?—We never bring in that sort.

18,061. (*Mr. Lefevre.*) How many seine nets have you?—Several.

18,062. What is the size of the mesh of those nets?—An inch.

18,063. Is that the smallest?—No, 50 odd across the yard is the small net.

18,064. What do they catch?—Sprats and smelts.

18,065. Would you like to see a regulation enforced that would restrict you to the use of the large-meshed seine?—Yes.

18,066. You think that would be small enough?—Yes.

18,067. Would you like to give up the use of the small-mesh seine?—Yes, and the trawl too.

18,068. Does it not pay to fish with a small-mesh seine net?—I know that it does not.

BRIGHTON.

J. Salvage.

7 Dec. 1863.

18,069. Then why do it?—I may as well fish with it as another person.

18,070. Then why does anybody use it?—That I cannot say.

18,071. Does it not pay with all of them?—How can it pay when we catch fish not as large as my hand.

18,072. Do you catch many of those?—Yes.

18,073. Has the quantity of smelts and sprats fallen off of late years?—Yes.

11,074. Do you not catch them now?—Not many.

18,075. Why is that?—Because the use of the small scale has spoilt the brood.

18,076. Do you think the small scale has spoiled the brood of smelts?—Not the smelts, all the herring and mackerel and soles too.

18,077. Do you catch many mullet?—I have been after them day after day and have not caught one in the summer.

18,078. Have they left the coast altogether?—They are all caught and killed.

18,079. Have you a shrimp-trawl?—Yes.

18,080. Do you use it in a boat?—Yes, and I have done so for years.

18,081. Would you like to see a regulation established that would put a stop to the use of it?—Yes, I would burn mine to-morrow.

18,082. You think it does you no good?—Yes; it does harm.

18,083. Does it catch a number of immature fish?—Yes, a considerable sight of them.

18,084. Do you catch many shrimps in it?—No.

18,085. It does not pay then?—No.

18,086. And yet you have gone on using it for years?—I have not used it for years now.

18,087. Do other people use shrimp-trawls here?—Yes, 20 boats or more.

18,088. Would they all be equally ready to burn their shrimp-trawls?—I cannot say.

18,089. Perhaps they are not as old as yours?—I cannot say; they are as big an evil.

The witness withdrew.

NATHANIEL GUNN called and examined.

N. Gunn.

18,090. (*Mr. Lefevre.*) Have you any observations to make with regard to the evidence which has been already given?—I have a boat, and I should like to see the fishing better carried on; I wish to see the fish more plentiful, so that the fishermen could be better paid for their labours.

18,091. Do you agree with the last witness, that it is desirable to put a stop to trawling for shrimps?—I do, and also to seining. A stop should be put to the small-scale seine nets.

18,092. Would you put a stop to all seine-fishing?—I would, and it would be for the good of the fishermen. Where you see one boat on our beach now you would see three or four, and you would not see young men compelled to take up hand-baskets and go round with small fish for sale, which they are now compelled to do in consequence of the quantity of small fish taken.

18,093. Would you restrict the size of the nets?—Yes.

18,094. Would you go further and put a stop to seine-net fishing altogether?—Yes, unless they had the same scale as the mackerel nets.

18,095. You would prohibit the use of the small scale?—Yes, no brood should be taken.

18,096. And also the shrimp-trawling?—Yes, they catch a great number of small fish in them, no larger than my nail.

18,097. Do they catch much of that?—Yes, more fish in number than our fishing boats altogether.

18,098. More in number?—Yes.

18,099. Do they catch a larger number of shrimps?—Yes, and they catch immense quantities of small fish with the trawl also.

18,100. Do they sell those small fish?—No.

18,101. Then they don't go out to catch small fish, but shrimps only?—Yes, but they cannot help it in the small-scale seines. You may go from Brunswick Square for 2½ miles and you will see a large supply of small fish among the seaweed; the sun perishes it.

18,102. Do they catch small immature fish in the shove nets?—Very few, and they throw them into the water again.

18,103. Then why do they catch so many in the trawl nets?—They fish further out, and they use a larger net. Their net is 14 feet long.

18,104. Where do they trawl?—Just aback of the shrimp men.

18,105. At what distance?—100 or 200 yards.

18,106. Is that beyond the reach of the seine nets?—No.

18,107. What length will they reach?—They are 200 yards long, and they go round in a circle.

18,108. The trawlers fish within 200 yards of the coast?—Yes.

18,109. Then they are beyond the reach of the trawlers?—No.

18,110. The length of the seine net is only 200 yards?—Some are 240, and they will shoot them out for 300 or 400 yards.

18,111. What is the furthest distance you have seen a seine net spread out?—Nearly half a mile out. They tow the net in until it touches the bottom. They tow it in towards the shore with their anchor ahead. They tow it in with boats.

18,112. Is it only of late years that you have noticed the use of the small-mesh seine?—It has been used for very many years. Every year it has been getting worse and worse. The fish have been decreasing every year.

18,113. The fishing has been worse and worse every year?—Yes, by the seines; of course, if you take the eggs and the young away there will be no brood.

18,114. Have you noticed more seine nets year after year?—Yes.

18,115. Do you think the seine nets catch less mackerel than they did formerly?—Sometimes they have a spurt.

18,116. Do they catch more than they did?—Yes, more than they did.

18,117. Then it does not look as if the quantity of fish had decreased?—But they are smaller.

18,118. Do the seine nets catch fewer large mackerel than they did?—No, more.

18,119. Then the quantity has not decreased?—There are fewer large ones caught, but more small.

18,120. Are there really fewer large fish caught?—Yes.

18,121. Then do you agree with the last witness that the take by the seine net does not pay the fisherman?—Yes, it injures everybody.

18,122. Have the number of seine nets used along the coast increased?—Very much indeed.

18,123. You think that each of the nets catches fewer large fish than formerly?—They catch very few of the large fish, but great numbers of small.

The witness withdrew.

The inquiry was then adjourned until Monday, the 21st December, at Torcross.

CROSS.

Pepperell.

ec. 1863.

Torcross, Devonshire, Monday, 21st December 1863.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

ROBERT PEPPERELL called and examined.

18,124. (*Professor Huxley.*) Are you a fisherman here?—Yes.

18,125. How long have you been a fisherman here?—For 20 years, but not at Torcross. I have been living at Slapton.

18,126. Are you a native of Slapton or Torcross?—Of Torcross.

18,127. But you have been living at Slapton for the last 20 years?—Yes.

18,128. Are you acquainted with the fisheries at both of those places?—Yes.

18,129. Do you know how many persons are engaged in fishing at Slapton?—Yes.

18,130. What is the number?—About 20 men, and 15 or 16 women.

18,131. How many persons are engaged in fishing at Torcross?—About the same number, or rather more.

18,132. Are there any other fishing villages in this neighbourhood as well as those you have mentioned?—Yes; Beesands and Hallsands.

18,133. How many persons are employed in fishing there?—At Beesands there are about 20 men, or perhaps more; I do not know exactly, but there are men from Beesands here who can give you evidence upon that matter. The fishermen of the villages of Beesands and Hallsands are engaged almost entirely in crab-fishing. Nothing is done in that way at Torcross or Slapton. It is mostly seine, line, and pilchard-fishing that is practised here, and at Slapton.

18,134. How many boats are employed in the fishing at Torcross?—There are three mackerel seines in Torcross, and six drift pilchard boats. The hooking boats and the small boats vary from about a dozen to 14 or 16 sometimes.

18,135. (*Mr. Lefevre.*) Are they open boats?—Yes.

18,136. What do they catch?—The hook-and-line boats catch whiting, ray, and conger eels.

18,137. Are there any decked boats employed here?—No, they are all open boats.

18,138. (*Professor Huxley.*) How many are there at Slapton?—At Slapton there are five or six hook boats.

18,139. Are there many seine boats there?—There are three at Slapton, three at Torcross, three at Beesands, and three at Hallsands.

18,140. How long are those boats?—From 22 to 24 feet long.

18,141. And none of them are decked?—No.

18,142. What is about the cost of a boat like that?—Do you mean boat and seine?

18,143. Yes; the boat fitted up?—The boat and seine altogether will cost about 120*l.*

18,144. What is the cost of the hooker boats?—The hook boats fitted up will cost from 15*l.* to 16*l.* Those are the small hook-boats. The drift-boats and nets cost rather more than 100*l.* each.

18,145. We have visited this place in consequence of a petition which has been forwarded to us. The first paragraph in that petition contains a statement that persons engaged in the seine and crab fisheries in Start Bay have embarked a capital of 2,000*l.* in it. Do you agree with that statement?—I should think it is more than that.

18,146. Has the number of boats employed in that way increased within your recollection?—The seine-boats have increased.

18,147. Have the hookers not increased?—I think the hookers are about the same, but the crab boats have increased.

18,148. Now, with respect to the quantity of fish you can obtain by your boats, has that quantity of fish increased or diminished, or remained stationary?—The flat-fish have diminished, such as plaice, dabs, doreys, and the like; they have diminished very much; there used to be three craft kept when I was a youngster; that, however, has almost entirely died out, and been given up.

18,149. You are speaking now of flat-fish?—Yes; what we call "tuck netting."

18,150. Were they caught in the seine?—No, in a tuck net, drawn ashore by women and others.

18,151. (*Mr. Lefevre.*) Were they drag nets?—Yes, a drag net with lead on the bottom.

18,152. (*Professor Huxley.*) What do you call a seine?—A seine we shoot as an average distance from the shore from about 60 to 100 fathoms. We seldom shoot them more than that because we have such tides that we could not work them. In the middle of the bunt the net is from 12 to 13 fathoms deep. We have deep water close in-shore here.

18,153. How long are the seines?—The length of a seine will be about 150 fathoms.

18,154. What is the size of the mesh?—The inside part of the mackerel net has a two and a half inch mesh. The bunt is the same as a pilchard net for catching pilchards. We can catch both pilchards and mackerel in the seine. We do not keep two nets for two different kinds of fish.

18,155. How do you use the seine?—We shoot it out, and draw it ashore. We have a man at one end of it, and it is drawn ashore. We never tuck any nets here. They are all drawn ashore on the beach.

18,156. Is the foot rope of your seine loaded?—No stones are slung to the foot rope.

18,157. Everything is dragged ashore here?—Yes.

18,158. You do not practise circle net fishing?—No, we could not do that in consequence of our tides running so hard into the bay.

18,159. What is the difference between a seine net and a tuck net?—A tuck net is very small, and the arms are not more than three fathoms deep. In the bunt they are about four or five fathoms deep.

18,160. Has it any pocket?—No, it has no pocket at all, but it is contracted at the sides. As it is drawn ashore the fish go back into the bunt.

18,161. That description of net is used for catching flat-fish?—Yes; the tuck nets are loaded at the foot rope.

18,162. When you use the seine, does the foot of the seine reach the bottom?—Yes.

18,163. So that in dragging it ashore the foot of it must be dragged along the bottom?—Yes; the mackerel are apt to go over if the net is too low.

18,164. Do you not catch flat-fish in the seine as well as in the tuck net?—Very seldom. We only get occasionally a stray large flat-fish.

18,165. How is it you do not do that if both nets are dragged on the bottom?—We do not go out on to a muddy bottom. We get out to the oyster beds or the cockle beds.

18,166. You have to go out to a muddy bottom when you work with the tuck nets?—Yes, with such nets we sometimes go out for 1,400 or 1,500 fathoms.

18,167. If you thought fit to use your seine nets on a muddy bottom you could catch flat-fish with them?—Yes, but we could not catch as many flat-fish in them as in the tuck nets. The foot ropes do not go to the bottom to drag in the same way as the tuck nets.

18,168. They do not drag in the same way?—No.

18,169. They are not so heavily loaded?—No, the seine is hung down, so that it should not bury itself in the shingle.

18,170. Then does the great difference between the tuck net and the seine consist in the way in which they are loaded?—Yes.

18,171. When you work the tuck net in particular do you not get a great many small fish?—In the summer time we get a great many small fish. I can recollect meshes of all sorts of sizes having been used here. Now we have got to a mesh of $2\frac{3}{4}$; that has been used here for years.

18,172. You say the size of the mesh is $2\frac{3}{4}$; do you measure it from knot to knot?—No, that is the full length drawn out.

18,173. What will be the length from knot to knot?—Half that distance.

18,174. It will be $1\frac{3}{8}$ inches from knot to knot?—Yes.

18,175 Do you think the size of the mesh makes any difference in the catch of small fish?—Yes, I think we ought not to be allowed to use as small a mesh.

18,176. Have you been in the habit of fishing with the tuck net for many years?—The tuck-net fishing used to be practised ten times as much as it is now.

18,177. It has fallen off then?—Yes, on account of the fish being scarce, and I think that is to be attributed more particularly to our catching more small fish in the summer months, and to all the spawn being destroyed by the trawlers and the oyster dredgers in the winter months.

18,178. How long is it since you can recollect large catches of tuck-net fish, when fish of all sizes were caught?—About 25 years ago. There was a great quantity of tuck-net fish caught then.

18,179. Was there any talk then of the tuck-net fish having fallen off in quantity?—No, I do not think there was.

18,180. There were plenty of fish then?—Yes, but there were not one-half or one-fourth of the number of trawlers there are now.

18,181. But still the tuck-net fishing went on?—Yes.

18,182. Do you know how many years tuck-net fishing has been going on here?—No.

18,183. In your father's time was tuck-net fishing practised here?—Yes, I think it was practised in my father's time and in my grandfather's too.

18,184. Has it gone on for 60 years?—Yes, and more than that.

18,185. It has gone on regularly every summer?—Yes, I have heard my grandfather talk about a time when a mesh of $3\frac{1}{2}$ inches was imposed on the fishermen. They used it for some years, but no notice being taken of the nets they went back to what the mesh used to be before.

18,186. Have the fishermen in the bay here been in the habit of catching a great number of small fish every summer by means of the tuck net?—Yes.

18,187. What do you use the seine net for?—Mackerel, and pilchards, and herrings. It is entirely for shoals of herrings, pilchards, or mackerel.

18,188. You do not mesh the fish in the seine nets?—No.

18,189. You sweep them in?—We do not mesh them if we can help it. If they mesh themselves they knock the net down. We have lost a great quantity by using the common herring mesh. The fish mesh in that, knock the nets down, and go over them.

18,190. When you are catching shoals of mackerel and pilchards in the seine net do you not occasionally sweep small fish in?—No, except the small brit and sprats that the mackerel are after; they can get through.

18,191. Do you think the small fish go out under the seine?—No small fish come in here, as they do in most bays. Brit, sprats, launce, and sand-eels come in, that is all.

18,192. How long is it since the flat-fish have fallen off in the bay?—The flat-fish have greatly diminished during the last 20 years.

18,193. Have you found any diminution in the herring, mackerel, or pilchard fisheries?—No, but it is all according to the season. 24 or 25 years ago we got no mackerel or pilchards for several years; then they came in. We have had mackerel scarce this year and last year. Of pilchards we had none last year, and this year they were rather slight. It all depends on how they strike into the bay.

18,194. Then is your complaint with regard to flat-fish?—I do not see what alteration could be made in the nets in this bay, except with regard to the tuck nets.

18,195. What do you number among flat-fish?—Plaice, doreys, ray, and dabs.

18,196. (*Mr. Lefevre.*) Do you take many mullet?—No.

18,197. (*Professor Huxley.*) The falling off in the flat-fish has been noticed for upwards of 20 years?—Yes.

18,198. Has it gradually increased every year?—Yes, last summer was the worst year we have ever known for flat-fish.

18,199. What do you ascribe the falling off to?—We ascribe it to some oyster beds that were found off here. When they were found there were a large number of vessels, steamers and other boats, dredging off the spot, and they took up plaice and dabs and all sorts of flat-fish. They used dredges with a small mesh, and dredged up everything—spawn, and small fish, and everything. The bit of ground on which they worked stretched from Dartmouth Harbour down the bay, and they dredged all over it and destroyed all the spawn of the flat-fish.

18,200. Did that occur last year?—Yes.

18,201. Then that will not account for their having fallen off every year for a number of years?—No.

18,202. What was the first cause of their falling off?—It was on account of the trawlers trawling so much in the bays, and trawling particularly all over the bays in the winter months. By that means they destroyed the spawn, and in the summer months they caught a large quantity of small fish. I have seen some of the trawlers come in and trawl within 200 yards of the shore all over the bay.

18,203. When do they come there?—All through the season.

18,204. Summer and winter?—Yes.

18,205. Do you think the trawlers with their trawls did more harm to the flat-fish than you in working with your tuck nets?—Yes.

18,206. In what way?—They catch more fish in one day than we catch in a month.

18,207. How is that?—They go over so much ground in a breeze of wind. They use a small mesh, and they take up everything.

18,208. But still both classes of fishermen were catching small fish?—No doubt, and so far as we are concerned I think it would be greatly to our benefit if we were to use a larger mesh.

18,209. Do you think that the size of the mesh you use has much to do with the size of the fish you catch?—Yes, the small fish would go through. There are some times in the summer when weeds are about that we might catch small fish on account of the mesh becoming clogged up. The mesh is made of a fine light twine, and when weeds are about they get in and close it up.

18,210. In your opinion both trawling and tuck-net fishing are more or less injurious to the fishing in the bay?—Yes.

18,211. If trawl-fishing were put down would you think it right that tuck-net fishing should also be put down?—Not altogether. We have no other means of catching flat-fish except with the tuck net.

18,212. But the trawlers have no other means of catching flat-fish except by using the trawl?—That is very true, and if they used a fair-sized mesh I do not think they would do much injury.

18,213. The trawlers are required by the law to use a mesh not less than $1\frac{3}{4}$ inches from knot to knot?—All I can say is that some of their inside meshes are not an inch from knot to knot.

18,214. That is altogether illegal. Do you think it would meet all you desire if they were obliged to comply with the law, and have a mesh $1\frac{3}{4}$ inches from

RCROSS. knot to knot?—Yes, I think the flat-fish would be protected by such a regulation as that.

Pepperell. 18,215. You would not like to use a larger mesh than that yourself?—No, I think $3\frac{1}{2}$ from knot to knot is enough.

Dec. 1863. 18,216. But the legal mesh is $1\frac{3}{4}$?—Yes, but I was speaking of it drawn out.

18,217. Would small fish go through that?—Yes.

18,218. We have been told by the trawlers that if the mesh was made larger than that they could not catch soles, because the soles would double themselves up, and go through; is that your opinion?—Yes, soles would go through.

18,218*a*. Suppose the mesh was as large as $3\frac{1}{2}$ inches from knot to knot then the soles would easily go through?—Yes, they would not catch a sole at all if the mesh was larger. A very large sole would go through a $3\frac{1}{2}$ inch mesh.

18,219. What kind of measure would meet your views here; would you have the trawlers kept out of the bay altogether?—The trawlers do great injury to all the fish. They not only injure the flat-fish, but all kinds.

18,220. Let us dispose of the flat-fish question first. Would you have the trawlers excluded from the bays on account of the injury they do to the flat-fish?—If they were not allowed to work in the bays during the daytime flat-fish would be very abundant here. Ours is an open bay, free from rocks.

18,221. Do they do most damage by destroying spawn or young fish?—They do most damage in the winter by destroying spawn.

18,222. When do flat-fish spawn?—From December to February.

18,223. Have you any reason to believe that they spawn in the bays?—Yes, I believe they do spawn in the bays.

18,224. Why do you think so?—I think so because we generally get small fish in the summer months off the oyster beds on the mud ground.

18,225. Do you not think they may come in from the outside?—They may come in from the outside, but we think they spawn in the bay. If we catch plaice in November we generally find that they are about spawning then.

18,226. Do you mean that they are full fish, full of spawn, when you catch them in November?—Yes.

18,227. Do you catch soles full about that time?—Yes.

18,228. Do you think that all descriptions of flat-fish are full in the winter time?—We think that they all spawn from the latter end of the month of December until January.

18,229. Do you cease fishing then?—Yes, we give up all our fishing for flat-fish after October, and we do not commence it again until the beginning of the month of March.

18,230. Is it your opinion that trawling is injurious in two respects, because in the first place it destroys the spawn in the winter months, and in the second the young fish in the summer months?—Yes.

18,231. And on that ground you would like to see a stop put to it altogether?—Yes, on our part we never use the tuck-net after October.

18,232. Why is it that you never use it after October?—We give it up altogether on account of the coarseness of the weather principally.

18,233. (*Mr. Lefevre.*) During what time do you give it up?—From the beginning of November until March.

18,234. (*Professor Huxley.*) Do you find, as the result of your experience, that flat-fish generally come in closer to the land when they are full and ready to spawn?—We generally find that we can take more large fish in the month of November than at any other time.

18,235. Is there much difference?—We get a much greater number of large fish in the latter part of October and in the month of November. At that time we do not see much small fish, but the fish caught then are generally very large.

18,236. (*Mr. Lefevre.*) I thought I understood you to say that you leave off fishing altogether from November until March?—Yes, the seine nets are put away during that time.

18,237. What do the fishermen do then for a livelihood?—They go on the land to work.

18,238. Do they go to work as agricultural labourers?—Yes, a few of them go to work as agricultural labourers. Others go to other occupations. Some do a little oyster-dredging in the winter time.

18,239. (*Professor Huxley.*) Did I understand you to say that there is a great deal of crab-fishing here?—Yes.

18,240. Where does it take place?—At Beesands and Hallsands.

18,241. Is there no crab-fishing at Torcross?—No.

18,242. How is it carried on at Beesands and Hallsands?—Each boat lays down from 50 to 60 pots. I have contracted for five or six years past with the boats at Beesands for the crabs they take, and I send them off to Billingsgate Market. I have known as many as from 6 to 8 and 10 tons go away in the course of a week.

18,243. Is that the average quantity sent away?—Yes. I should say that in the summer months the quantity sent away every week will average that.

18,244. Do you not sell any of the crabs about here in this neighbourhood?—No, none are disposed of in the neighbourhood. They are all sent to London, to Billingsgate Market.

18,245. Is the fish you catch here sold here or sent off to London?—The mackerel we catch is sent to London, Bristol, and other places, but the other kinds of fish are sold here.

18,246. How long have you been familiar with crab-fishing?—Not for many years.

18,247. Do you know whether the number of boats engaged in crab-fishing has increased of late years?—Yes, I believe the number of boats has increased, but I do not know much about it, further than having been occasionally for the last 10 or 12 years where it is carried on. I have also during the last five or six years contracted with boats engaged in the fishing for the supply of crabs they take.

18,248. Have you found that the supply of crabs has been equally abundant every year?—Sometimes the supply has been greater and sometimes less, but generally it has remained about the same.

18,249. What other mode of fishing is practised at Beesands?—There is no other fishing, except with the seines, that we use here.

18,250. Is there any lobster-fishing carried on there as well as crab-fishing?—Yes; they fish both for crabs and lobsters.

18,251. You include crabs and lobsters together?—Yes. There are not many lobsters caught. Crab-fishing is the most productive. There is a far greater supply of crabs than of lobsters.

18,252. Is there any long-line fishing practised here?—Sometimes, in the fall of the year, some of the fishermen will go out with long-lines and fish for conger and codfish.

18,253. Is that at all an extensive fishery in this neighbourhood?—No, it is not.

18,254. Do they catch fish in that way for home consumption, or the London market?—For home consumption principally. It is not sent away to London.

18,255–6. Where do they use the long lines?—They generally set them along the rocky shore.

18,257. Is there any limit placed by the fishermen upon the size of the crabs caught?—No, I do not think there is; but the crabs taken in this bay are of very large size.

18,258. Do you find that any damage is ever done to your crab-pots by the trawlers?—Yes, there sometimes very considerable damage done to them by the trawlers. They trawl away where they know that the crab-pots are lying, and they carry away scores of them. Very great injury is often done in that way.

18,259. Are the crab-pots buoyed?—Yes.

18,260. Then the trawlers can readily see them if they choose to look for them?—Yes.

18,261. Do they come inside the bay at night and trawl?—Yes.

18,262. How near in-shore do they come?—I have known them to be trawling within 100 yards of the shore.

18,263. Were they trawling as close to the shore as that at night?—Yes, they have been as near as that at night.

18,264. Upon such occasions have they gone over the crab-pots and carried them away?—Yes, they go right over the ground where the crab-pots are set, and frequently they do a great amount of damage by carrying them away.

18,265. (*Mr. Lefevre.*) What is the value of a crab-pot?—From 7*s.* to 8*s.*, or perhaps more than that.

18,266. (*Professor Huxley.*) Is there no remedy you can suggest by which the trawlers could be prevented from doing injury to the crab-fishing?—I do not know that there is. The men engaged in the crab-fishing have tried sometimes to put a stop to it. They have gone off with their boats and boarded the trawlers, but they have never been able to make anything of them, although the crab-pots have been torn clean off the ground. The trawl nets have torn them clean off the ground, and have destroyed the fishing altogether.

18,267. Is there any considerable drift-net fishing carried on here in these villages?—There are six drift-net boats kept here.

18,268. What is the length of nets that each boat carries?—About 400 fathoms.

18,269. Are they used for catching herrings or pilchards?—They are used for both, but mostly for pilchards.

18,270. Do you use the same sized mesh for both?—Yes, but we do not do much in the herring-fishing.

18,271. There is a complaint, I find, in your petition against the trawlers for carrying away the drift nets?—Yes.

18,272. Has much damage been committed in that way?—Yes, at times. Damage has been done to some of the drift nets this last season. I remember upon one occasion that a trawler came in and cut through our mackerel seines when they were not 50 yards from the shore; he carried off nearly one-half of them and did considerable injury.

18,273. Were you all in-shore then?—Yes. The wind was blowing a gale at the time from the north-west. We could not see the number of the boat by which the damage was done, but we knew it was a Brixham boat. I went to Brixham subsequently, and found part of the nets, which the trawlers said they had picked up. Altogether it cost me 30*l.*, and all the injury was done within 100 fathoms of the shore.

18,274. Is there no number on the sails of the trawlers?—Yes, they are all numbered.

18,275. Then could you not see the number?—We took no notice of it at the time the injury was done, until we found they were going away again. The wind was blowing a hard gale of wind from the north-west, and we tried to run after them.

18,276. (*Mr. Lefevre.*) I presume you were not able to identify the boat sufficiently to enable you to take proceedings for the recovery of the amount of loss you had sustained?—No, unfortunately we were not.

18,277. (*Professor Huxley.*) But if a man choose to rob your orchard and you are unable to detect him, I do not see what remedy you can have?—That is quite true.

18,278. Do you think it impossible that the trawlers can be allowed to trawl in the bay without doing damage?—Yes; if the drift-net fishermen go out and shoot their nets they do not take the slightest notice of them; they go and cut right through them.

18,279. That is altogether against the law?—I believe it is.

18,280. Are not the trawlers aware of that?—They ought to be.

18,281. If the trawlers do that and an information is laid against them they render themselves liable to be fined; they have no business to come near the drift-net men at all?—They do not take the slightest notice of that here, but they come right across our nets.

18,282. Is there anyone here whose duty it is to look after the fisheries and see that the law is observed?—No.

18,283. Do the Coastguard takea ny notice?—No.

18,284. Are you obliged to have your boats numbered here?—It is only the drift-boats that are numbered.

18,285. (*Mr. Lefevre.*) What is the width of the bay from Start Point to Mewstone?—About 9 miles.

18,286. How many miles is it going along the shore?—It is not much more; perhaps it may be half a mile further.

18,287. How much ground is there in the bay that is fit to be drawn over by the seine nets?—Nearly the whole if it; there is a little ledge of rocks between the village of Beesands and Hallsands, and there is another little ledge below here, not more than a couple of hundred yards wide.

18,288. Is the whole of the remaining ground fished over with the seine nets?—Yes.

18,289. How many tuck nets are there belonging to this place?—It is very seldom that tuck nets are used at all here—at Torcross—except in the spring, and there are not more than two or three used at Slapton.

18,290. What is the best season for the use of the tuck net?—The best fish are caught in the tuck nets from the month of March to May, and again from August to November.

18,291. In the interval do you use the seine net more?—Yes, we use the seine net and practise hooking mostly in the summer months. The tuck net is not much used in the summer months, during June, July, and August; the tuck nets are mostly put by then.

18,292. What do you catch principally then?—Mackerel.

18,293. Is that the best season for mackerel?—Yes.

18,294. When does the drift-net season commence?—It commences generally about the first spring tides in August; we begin to get the boats out then.

18,295. I think you said that you can recollect the fishing here for a period of 27 years?—Yes.

18,296. Have you observed any great increase in the number of trawlers who have been trawling in the bay during that time?—Yes, there has been a considerable increase in the number.

18,297. What is the number that frequent the bay in the course of the season now?—Perhaps 20, 30, or 40 of them will come in and let down their trawls all over the bay; their trawls will stretch all over the bay.

18,298. Can you recollect what has been the increase during the last 27 years?—No, I do not know.

18,299. Are there double the number of trawlers fishing in the bay in a season now as compared with the number that used to frequent it 27 years ago?—Yes, I should say there are.

18,300. Are there more than double?—There must be double at least.

18,301. Are they larger boats than they were formerly?—I think they are differently built from what they used to be, they are sharper and more cutter like built than they used to be.

18,302. Are they generally here throughout the year, or do they only come at particular seasons?—If they know that there is fish to be got in the bay they are constantly here.

18,303. Do they come in the summer as well as in the winter months?—Yes, both winter and summer.

TORCROSS.

R. Pepperell.

21 Dec. 1863.

18,304. Do you ever find that they are fishing here in the winter when you are unable to go out fishing at all?—Yes, we never use the tuck nets from November until March.

18,305. Have you ever heard any complaints on the part of the trawlers that they cannot catch as many fish now as they were formerly in the habit of catching?—No, I am never with them when they are trawling.

18,306. Have you any reason to believe that they do complain?—I have heard that trawl-boats have been sold at Brixham on account of the fisheries not having been as good as they were.

18,307. You have been told that?—Yes, by some of the Brixham men.

18,308. But you have not observed any decrease in the number of trawlers in the bay here?—No.

18,309. Can you account for the fact that they seem to catch fish in places where you do not?—No.

18,310. Do they trawl over the same ground as that upon which you use the tuck nets?—Yes, but we cannot go to so great a distance off the shore as they can with their vessels.

18,311. Do they not come as close in-shore to fish as they used to do?—They come closer in occasionally I think, but at the same time if they choose they can fish further off than we can.

18,312. And I understand you to say that they can catch as much fish in a day as you can catch in a month with the tuck net?—Yes.

18,313. Then do you not think it probable that they catch the fish which you used to catch formerly?—Yes, they catch great quantities of large fish which we could catch if they were not here, but they lessen the fish altogether.

18,314. They lessen the fish because they catch them?—Yes, but the mischief they do is in catching the small fish.

18,315. They commit a great amount of destruction in that way?—Yes; I think it is a great pity that it should be caught, because it is of no value to anyone; in point of fact they throw overboard in the course of a day's fishing cartloads of small fish.

18,316. It would scarcely be worth their while to come here and catch small fish solely for the purpose of throwing it overboard again?—No, they no doubt expect to getl arge fish, but it is well known that they do throw overboard immense quantities of small fish.

18,317. Have you any reason to believe that they have found any diminution in the number of large fish they can catch?—No.

18,318. How are the fishermen paid here; are they paid by wages or by share?—By share.

18,319. How many men are there to a boat?—A seine boat will average 10 men, and generally eight or nine women are engaged in drawing the nets ashore.

18,320. Do the seine nets belong to one person or to more than one?—They belong to different persons; some of the seine nets are held by three or four of the men who work them.

18,321. Three or four of the fishermen?—Yes.

18,322. What share does the owner of the net get?—The owner of the seine takes 10 shares.

18,323. What do the fishermen get?—Every man is counted a share; every woman gets a three-quarter's share, and the boat takes 10 shares.

18,324. Do you find that you make less money than you used to make 27 years ago?—I do not know that there has been any falling off in the seine-fishing at all; the only difference we experience is in the seasons, one season may not be as good as another.

18,325. Taking the year through do the fishermen make less wages than they used to make?—I do not think they do.

18,326. Has the number of fishermen increased or diminished?—The number has decreased in Torcross.

18,327. But has the number decreased taking the bay through?—No, it has rather increased I think.

18,328. Has the price of fish increased or decreased?—It has increased.

18,329. Can you say how much it has increased?—No, I cannot say what the increase has been, but the price of fish has increased since the railway came so near to us.

18,330. Then I presume that a portion of your catch of fish is now sent away by railway?—Yes; we used to send the crabs to Newton when the terminus of the railway was at Newton, but when it came to Totnes crabs went up in price directly.

18,331. Do you send the mackerel you catch here to Totnes?—Yes.

18,332. Do you send any great quantity in that way?—Sometimes. They are packed up in pads, and are sent to Totnes to be forwarded to London, Bristol, and other places.

18,333. How long have you sent them to Totnes?—For the last 10 or 12 years.

18,334. Do you catch any sprats here?—We do sometimes, but we do not make much sale of them here.

18,335. Have you any nets especially for catching sprats?—No; we sometimes catch them with the lanuce net, which is made especially for catching sand-eels close in-shore, generally about the month of April.

18,336. Have you ever been on board a trawler when they have been taking up their nets?—No, I never was on board then.

18,337. Then on what do you found the statement you have made, that they take up spawn in their nets?—I have been led to believe that they do destroy the spawn from what I have been told, and also from knowing that they have been dragging throughout all the winter months over the ground where the spawn lies.

18,338. But you have never seen any spawn taken on board a trawler?—No, I have never been on board a trawler when they have drawn up the net.

18,339. Then, if you have not been on board, it is impossible for you to speak as to the quantity of small fish they take up?—Yes, I cannot speak of my own knowledge.

18,340. What is the size of the mesh of the seine nets you use?—The size of the mesh of the wings of the mackerel net is about $2\frac{1}{2}$.

18,341. Two and a half inches from knot to knot?—No; the full length of the mesh.

18,342. You say that you do not catch any young fish or small fish in those nets?—Not in the seine nets, unless we may occasionally get a plaice or two, or a flounder, along the shore that may have strayed in on to the ground we fish over. With those exceptions, I have never seen any small fish in the seines.

18,343. You only catch small fish in the tuck net?—Yes, only in the tuck net when we go out after the flat-fish.

18,344. What regulation would you propose to enforce in order to put a stop to the catching of small fish by the tuck net?—If the fishermen were compelled to use a mesh sufficiently large that would put a stop to it altogether.

18,345. But you would not like to see tuck-net fishing put a stop to altogether in the summer months?—There is not much done in the summer months. If the mesh were required to be larger I think it would answer the purpose.

18,346. What size would you fix it at?—I think $3\frac{1}{2}$ inches would be sufficient.

18,347. What is it now?—$2\frac{3}{4}$; but for several years we have used it at $2\frac{1}{2}$ inches, which is smaller still.

18,348. I understood you to say that within the last year or two oyster beds had been discovered in this bay?—Yes.

18,349. Where was that?—In a line from Dartmouth Harbour, two miles off; they were in a line with the bay.

18,350. When were they first discovered?—In 1862.

18,351. Were they near Mewstone?—They were inside the Homestone; stretching from the Homestone down to the bay.

18,352. Towards Earlstone, or towards the Sker-

TORCROSS.

R. Pepperell.

21 Dec. 1863.

ries ?—Towards the Homestone rock; just in a line with that stretching down towards the bay.

18,353. About two miles ?—Yes ; but not as far as the Skerries.

18,354. How broad was the bed ?—I think it must have been about half a mile broad.

18,355. Did a considerable number of boats come in the bay to dredge over that ground ?—Yes.

18,356. And the oysters in consequence disappeared ?—Yes ; the dredging destroyed the bed entirely.

18,357. They carried everything away ?—Yes ; they had dredges with a little small mesh, and they have entirely ruined the oyster beds in the bay here. They dredged over the whole length of the bay, and took oysters we had in other beds.

18,358. Was that inside the Skerries ?—We had beds within 300 fathoms of the shore.

18,359. Have they been destroyed too ?—They have been injured considerably, but there are a few places between the rocks where the large vessels cannot tow that are still dredged by our little boats. A quantity of vessels came down here from Southampton and other places, and dredged away all they could.

18,360. Did they carry away both small and large oysters ?—Yes ; they wanted the small ones mostly. They lay them up in the Southampton river, and make natives of them after they have been there for a year.

18,361. Do you think that any means can be devised by which the destruction of the oyster beds may be prevented in future ?—I think the only means of preventing it would be to keep the vessels from a distance from coming here at all. If they would use a larger scale to their mesh they would not carry away so many of the small oysters.

18,362. Do they find the small oysters more valuable than the large ones ?—Yes ; they do not care about carrying away the large oysters. Some of our boats that go out dredging sell their oysters to them by the tub, and they would rather have the small fish.

18,363. Would it not be better to take away the large ones and leave the small ones to grow ?—They take away all together. After they have been dredging for some time they generally find it unprofitable to continue the work, and then they go away for a few years. During their absence the banks get up again ; but they will come again and in one season they will so ruin the beds that they will not be worth dredging for several years. Nevertheless, if they are left alone the oysters will come again.

18,364. Do you know anything about the spawning of oysters ?—No.

18,365. (*Professor Huxley.*) In the year 1817 there was a select committee appointed by the House of Commons who took evidence from this neighbourhood respecting the fisheries in Start Bay. Have you heard of that ?—Yes.

18,366. At that time 55 of the fishermen living in this neighbourhood presented this memorial :—"We, "the undersigned, being persons concerned and in- "terested in the fisheries between the Start and Ex- "mouth Bay, do hereby declare our opinion that it "will materially promote and benefit the said fisheries "if trawl and drag nets are prohibited being used in "Torbay from the 1st day of May to the 1st day of "November, and in Start Bay and Teignmouth Bay "from the 1st day of May to the 1st day of October." Drag nets would include your tuck nets, would they not ?—Yes.

18,367. The reason that memorial was presented appears to have been that the fishermen here were of opinion that the spawning of the fish mainly took place during the summer months ?—Yes.

18,368. From what I have heard from you to-day you are clearly of opinion that the spawning of the flat-fish only takes place during the winter months ?—Yes.

18,369. Under those circumstances such a regulation as that which was recommended by the fishermen in 1817 would have been wholly inoperative as far as the flat-fish are concerned ?—Yes ; I do not think it would increase those fish in the bay at all if no tuck nets were used in the months of June, July, and August.

18,370. Do you think that such a regulation as that which the fishermen thought desirable in 1817 would be of the slightest use now ?—No, I do not think it would.

18,371. Because if it is as you say that the flat-fish do not spawn until the winter months, they would be spawning at the time the drag nets are not used ?—Yes ; we do not use them when they are spawning, from November until March.

18,372. You see that this memorial contemplates allowing the use of trawling and of drag nets between October and May ?—Yes, and they would be used then at the time the spawning is taking place, for the flat-fish certainly spawn in the winter months.

18,373. As I understand you you do not think that the use of trawl nets or of the tuck nets interferes with fish of any other kind ?—No, but I think the trawlers catch a quantity of red mullet at times on account of the smallness of the mesh.

18,374. (*Mr. Lefevre.*) Have you yourself caught many red mullet here ?—Yes, close round the rocks.

18,375. Are they consumed in the neighbourhood ?—No, they are all sent to London.

18,376. How do you catch them ?—We draw a seine close round the rocks.

18,377. Do you think that all the fish caught here goes to Totnes to be sent to the market ?—Yes, all the crabs go there, and generally all the best fish.

18,378. Are there any decked boats at all used in this bay ?—No, we are obliged to haul up all our boats on to the beach, as we have no shelter for them.

18,379. (*Professor Huxley.*) Have you anything more to add to your evidence ?—No, I think not.

The witness withdrew.

J. Pike.

John Pike called and examined.

18,381. (*Professor Huxley.*) Are you a native of Torcross ?—Yes.

18,382. How long have you been a fisherman here ?—I have been fishing here for upwards of 60 years ; for 65 I believe.

18,383. You have heard the evidence of the last witness, Mr. Pepperell ?—Yes.

18,384. Do you agree or disagree with it ?—I think what he said about the mesh is very well ; the small fish ought not to be caught.

18,385. Do you agree generally with what he stated ?—Yes.

18,386. Do you remember the time when there was no tuck netting ?—Yes, not in the summer time.

18,387. When was that ?—Many years ago, when I was a young man.

18,388. There was no tuck netting then ?—Not in the summer time.

18,389. Was there any tuck netting in the winter ?—Yes, but they knocked off during the whole of the summer months.

18,390. Have you noticed any falling-off in the quantity of fish caught here within your recollection ?—Yes.

18,391. When did the falling-off begin ?—The falling-off has been going on for the last 20 years. The quantity has been constantly becoming less and less.

18,392. I suppose as you have been fishing for upwards of 60 years that you recollect very well the year 1817 ?—Yes.

18,393. Can you recollect an inquiry taking place here when Lord Vernon was here ?—I cannot recollect the name of the gentleman who was here.

18,394. (*Mr. Lefevre.*) Do you recollect an inquiry of some sort taking place here ?—Yes.

TORCROSS.

J. Pike.

21 Dec. 1863.

18,395. (*Professor Huxley.*) Do you recollect the Hon. Mr. Vernon giving evidence at that inquiry?—No.

18,396. Do you recollect the fish being very scarce 40 years ago?—I do not think there was any scarcity then.

18,397. Then has the only scarcity you can recollect taken place within the last 20 years?—Yes.

18,398. Forty years ago were there plenty of fish here?—Yes. We used to go in a fair year and catch a lot of fish, but we knocked off with the tuck nets in the summer months.

18,399. How long can you recollect trawling going on in this bay?—There has been trawling here ever since I can recollect. There were not so many trawl-boats in former years, but still there was some trawling to a certain extent. They come now in much greater numbers, and they drag across our nets, tearing them all to pieces. I have had nets of my own destroyed by them.

18,400. Then during the first 20 years of your fishing life the trawlers seem to have done no harm?—Yes they did.

18,401. But they did no harm in diminishing the quantity of fish?—Yes they did, and so many of them came in that they did a deal of damage by injuring the nets.

18,402. Did they do any damage by diminishing the supply of fish?—Yes.

18,403. I thought you said you could always find plenty of fish during the first 20 years of your experience as a fisherman?—There has been a greater scarcity during the last 20 years than there was before.

18,404. That has been within the most recent portion of your fishing?—Yes.

18,405. But trawl-fishing has been going on for the last 50 years?—Yes, ever since I can recollect, but there were not as many trawlers formerly as there are now.

18,406-7. (*Mr. Lefevre.*) Do you agree with the last witness that the number of trawlers has doubled?—Yes.

18,408. Do they fish here at all seasons?—Yes, at any time.

18,409. (*Professor Huxley.*) Do you agree with the last witness that it is only flat-fish that have fallen off?—Yes, the flat-fish have fallen off, and I believe the trawlers have injured the pilchards as well. The pilchard-fishing is not as good as it used to be.

18,410. Do you think there are not as many pilchards as there used to be?—Five years ago they were very plentiful, but they are scarce now. Some years we catch a lot, but in other years they are all off again.

18,411. Is there anything you wish particularly to add to the evidence of the last witness?—No, I can say no more than he has said already.

18,412. You agree with him generally?—Yes.

The witness withdrew.

W. Kelland.

William Kelland called and examined.

18,413. (*Professor Huxley.*) Are you a native of this place?—Yes.

18,414. How long have you been a fisherman here?—20 years.

18,415. Did you hear what was stated by the witness Pepperell?—Yes.

18,416. Do you agree generally with what he said?—Yes. I think it would be better if we were not to have any tuck-net fishing for two or three months in the summer.

18,417. Do you think the quantity of flat-fish caught here has fallen off of late years?—Yes.

18,418. How long is it since the falling-off first began?—10 or 15 years ago.

18,419. Was there plenty of flat-fish when you first began to fish?—Yes.

18,420. Is it 10 or 15 years since the decrease first began?—Yes.

18,421. What do you think is the cause of that?—I think it is owing pretty much to the trawlers coming in.

18,422. I understood you to say that you thought the tuck netting had a good deal to do with it?—If the tuck netting were stopped in the summer and the trawlers were kept out for a short time there would be more fish in the summer.

18,423. It is in your own power to leave off tuck-netting if you like?—Yes, but there would be no good in our leaving it off if the trawlers still continue to come in. If the trawlers are kept from coming in the bay and we were to stop tuck netting we should catch more fish and it would be better for all of us.

18,424. The fish the trawlers carry away you don't get, is that the effect of what you mean?—Yes.

18,425. Do the trawlers by coming in destroy the brood and everything else?—They destroy everything. There are sometimes as many as 40 dragging across the bay together.

18,426. Suppose the people here were to take to working their tuck nets very much indeed, would not that greatly diminish the supply of fish?—Yes, in the summer they would get hardly anything but small fish.

18,427. Why is working with the tuck net in the summer more injurious than in the fall of the year?—There are more small fish in the spring of the year and in the summer time. In the fall of the year we generally get larger and better fish.

18,428. Do you think that regulating the size of the mesh would prevent the tuck nets from doing injury?—Yes, they would not take as many small fish then.

18,429. What time of the year do you think flat-fish spawn?—I do not know. I should say in the summer, or just at the fall of the year.

18,430. The summer and the fall of the year?—Yes, we catch most small fish in the spring of the year.

18,431. In the spring?—Yes.

18,432. Has there been any falling off in any kind of fish except the flat-fish?—Yes, the hooking-fish, and whiting, brills, and other kinds, are much scarcer than they used to be.

18,433. Are whiting scarcer?—Yes.

18,434. Are haddocks scarcer?—We never catch any haddocks here.

18,435. But whiting are scarcer?—Yes.

18,436. To what do you attribute that?—I do not know. I think it is owing to the trawlers catching so many of them. They destroy a great deal of small whiting.

18,437. Is there any falling off in the seine fishery; do you work a seine?—Yes.

18,438. Is there any falling off in what it produces?—It all depends on whether the fish come in, the mackerel, pilchards, and herrings.

18,439. In your knowledge of this place during the last 20 years has the number of fishermen increased?—Not here, and there is not much difference taking the number of fishermen all along the shore.

18,440. (*Mr. Lefevre.*) I think Mr. Pepperell said that you do not use the tuck net here in the summer months, only in the spring and the autumn?—No, it is only at Slapton that they are used.

18,441. The tuck nets are only used at Slapton in the summer months?—We use them sometimes. We have tuck nets here.

18,442. Do you think it would be advantageous to put a stop to the use of tuck nets in the summer months?—If the trawlers were kept out of the bays then the tuck nets might be stopped also, but it would not make any difference if the trawlers are allowed to come in, because if the small fish are not caught in

the tuck net they will be caught in the trawl, and sometimes there are as many as 30 or 40 trawl vessels fishing in the bay in one night.

18,443. Have you noticed the same increase in the number of trawlers fishing off here as the last witness?—Yes.

18,444. Do they sometimes trawl close in-shore?—Yes, frequently.

18,445. Do they trawl over the same ground as that upon which you use the tuck nets?—Yes.

18,446. Have you any reason to believe that they have observed any considerable decrease in their catch of fish?—No, on the contrary, I think they catch more.

18,447. Do they catch more or less?—I do not know of my own knowledge, but I believe they catch more. Frequently they will trawl right across the pilchard nets. They will come the night after we have shot our nets and will tear right across us.

18,448. (*Professor Huxley.*) Cannot you ascertain their number?—No, not in the night time.

18,449. Do you carry lights?—Yes.

18,450. Do they?—No, they keep up no light when working in this bay.

The witness withdrew.

JOHN PHILLIMORE called and examined.

J. Phillimore.

18,451. (*Professor Huxley.*) You are a seine owner here, I believe?—I am a seine owner, but at Slapton, not here.

18,452. Do you own many seines at Slapton?—I have one and part of another; I also own some pilchard nets at Torcross.

18,453. Have you been engaged in this business for many years?—No, only for six or seven years.

18,454. Have you noticed any diminution in the quantity of fish caught in the seines of late years?—Not in the seines.

18,455. Are you engaged in any other kind of fishing?—I have tuck nets.

18,456. Did you hear the evidence of Mr. Pepperell?—Yes.

18,457. Do you agree with him that the quantity of fish caught in the tuck nets has fallen off?—Yes.

18,458. Of flat-fish?—Yes.

18,459. At what time of the year are your tuck nets used?—From the beginning of March to the middle of October.

18,460. Throughout the whole of the summer months?—Yes, throughout the whole of the summer months.

18,461. During that time do they catch small fish?—Yes, and it would be better for the tuck-net fishing if the mesh were made of the legal size.

18,462. What is the size now?—$2\frac{3}{4}$ inches, that is $1\frac{3}{8}$ from knot to knot. It ought to be $1\frac{3}{4}$.

18,463. Do you think that if the legal mesh of $1\frac{3}{4}$ were used it would prevent the catching of small fish?—Yes.

18,464. Would not the meshes drag?—They might occasionally. If there was any weed about the shore the small fish might stick in the net, but not otherwise. Dabs worth catching would not go through a mesh $1\frac{3}{4}$ inches from knot to knot.

18,465. You think that if the mesh of the tuck net were of the legal size it might be used throughout the summer without doing harm?—Yes.

18,466. Are you aware that the mesh of the trawl net is the same, namely $1\frac{3}{4}$ inches?—Yes.

18,467. Do you think it might be used with impunity in the same way?—I think if the trawlers were obliged to use a mesh $1\frac{3}{4}$ inches from knot to knot they would not do much harm in the bay in the summer months. It is in the winter time that they do so much damage. They come in when the plaice and dabs are full of spawn. They are full of spawn now.

18,468. At this time?—Yes, from the 1st of November until the 1st of March plaice are not worth having, yet they come in and destroy the plaice in the winter months.

18,469. Are they not good when they are full of spawn?—Yes, but after they are shotten they are worthless and out of condition.

18,470. When do they begin to spawn?—At the beginning of November. If we catch plaice now they will be full of spawn.

18,471. Then what injury do they do by catching them when they are spawning or when they are full of spawn?—I think they do great injury by catching them when they are spawning. They do two kinds of injury, namely, by using too small a mesh in summer, and in the winter by catching them when they are spawning. I think it would be better, far better, if all fishing was forbidden while the fish are spawning.

18,472. You would allow the trawlers to catch them up to the time they are full?—No, I would prefer that the trawlers should be kept out of the bay altogether.

18,473. You would allow the fish to be caught in the tuck nets up to the time they are full?—No, I would say "let the tuck nets stop too." I would take a month when they are spawning, and I would not let a tuck net go from the 1st of November. But in the winter we generally leave off fishing of our own accord. The fish thus have four months during which they are not caught in the tuck nets.

18,474. You would allow the tuck nets to take them until they get full and become ready to spawn?—Yes.

18,475. Does it not amount to the same thing whether the tuck nets take them when they are ready to spawn, or when they are spawning?—Yes.

18,476. As to the amount of damage done it makes no difference whether they take them when they are spawning, or when they are just ready?—Not a bit.

18,477. Then I don't see how your suggestion would benefit the fishing?—I would make the fence months longer.

18,478. But in any case you would take the fish full?—I do not think that would do us much harm if the trawlers were kept out of the bays. Now they rake up the spawn beds after the fish have spawned.

18,479. Do you think that the flat-fish spawn in the bay?—Yes.

18,480. What evidence have you of that?—The other day when they were drawing a seine net ashore they caught several large plaice full of spawn.

18,481. Do you ever get the spawn up in the same place?—I never noticed it.

18,482. Do you think the trawlers get it there?—Yes.

18,483. Do you not think that if the trawlers get it you would also get it in your tuck nets? You say you consider that the trawlers destroy the spawn of plaice by raking it up from the bottom?—Yes.

18,484. Do you think you would not get it up in your tuck nets if the plaice spawn was at the bottom?—I do not think we should as much as the trawlers. The trawlers go outside the rocks where we cannot go with the tuck nets. We are obliged to go where there are no rocks.

18,485. You have no positive evidence that plaice spawn in the bay; it is principally a conjecture?—Yes, it is only a conjecture, but I think you will find that most fish spawn in the bays.

18,486. What depth of water have you in your bay?—40 feet.

18,487. Six or seven fathoms?—About seven fathoms.

18,488. At what time do you see the young fish?—In the spring of the year.

18,489. Do they come into the shallows?—We have no shallows. When they use the tuck nets in the spring of the year they catch large quantities of young fish.

TORCROSS.

J. Phillimore.

21 Dec. 1863.

18,490. How big are they ?—Not longer than my finger.

18,491. How would you obviate that ?—I would make the mesh of the tuck net larger.

18,492. By making it $1\frac{3}{4}$ inches from knot to knot do you think you would not catch as many small fish ?—Yes.

18,493. Do you not think that the same thing would occur with regard to the trawlers if they were compelled to use a mesh of the legal size ?—Yes, I think it would improve the fishing altogether if the mesh were made $1\frac{3}{4}$ inches from knot to knot and the trawlers kept out of the bays during the time the spawning is going on.

18,494. They would not do more harm then than your tuck-net fishermen ?—They would not do more harm to the small fry except that the trawlers would catch more in one day than we should catch in a month.

18,495. But if you could improve your tuck-net fishing so as to catch as much in a day as you do now in a month you would not object to that I presume ?—I do not think that much damage would be done at all if the trawlers kept out of the bay.

18,496. In your knowledge of this place has the number of persons possessing seines increased or have people been led to invest money in them ?—I do not think it is much of a thing for people to invest money in, the fishing has been going back so very much.

18,497. How long has it been going back ?—I can speak from personal knowledge that it has been going back for six or seven years.

18,498. When you first went into the business was it going back ?—There were more fish then than there are now. They have been getting scarcer every year.

18,499. Had it fallen off before you entered the business ?—Yes.

18,500. For howlong ?—I have only been here six years last year.

18,501. Are you engaged in the crab-fishing ?—No.

18,502. Are you engaged in pilchard-fishing ?—I have some pilchard nets.

18,503. Do you notice any difference in the number of fish caught by them, taking one year with another ?—No ; but the trawlers ran into my pilchard boat this year. They ran ran right into her notwithstanding that the men hailed her. They were carrying lights, but the trawlers carried none and they took no notice.

18,504. (*Mr Lefevre.*) Was any damage done to the boats ?—Very little ; about a sovereign's worth. We ascertained the name of the trawler, but did not think it worth while taking any steps in the matter.

18,505. You thought it not worth while to seek a material remedy ?—Yes.

18,506. Has the number of trawlers increased or diminished here ?—They have rather increased in number, but one trawler that must have cost 800*l.* a few years ago was sold for 200*l.* a short time ago. Many have been sold for half their cost and less.

18,507. You have observed no decrease in the number that come here ?—No.

18,508. Have you any reason to believe that those who come catch fewer fish than they did formerly ?—I should think so. The fact that they use a smaller mesh is, I think, a proof of that.

18,509. How do you know they do use a smaller mesh ?—At Brixham they do.

18,510. Do they habitually use a smaller mesh there ?—Yes.

18,511. Have you yourself seen nets used with meshes smaller than the legal size ?—No, I have not seen them myself.

18,512. Have you observed a considerable number of trawlers here in the winter ?—Yes, sometimes they come in very close and sweep the bay from end to end.

18,513. You wish to see a stop put to their fishing here during the winter months ?—Yes.

18,514. During that time no fish would be caught here at all in this bay ?—No.

18,515. No flat-fish ?—No.

18,516. What is the number of trawlers that frequent the bay in the winter months ?—From 30 to 40.

18,517. Do you think that each of them catches as much fish in one day as your tuck net catches in a month ?—Yes ; they sweep over such an immense space of ground.

18,518. Would not the prevention of fishing in this bay by the trawlers put a stop to a considerable supply of fish to the market ?—No.

18,519. How do you account for that ?—Because the fishing would go on in the summer months the same as before. The tuck-men do not fish in the winter time themselves.

18,520. Do you anticipate that the increase in the catch by the tuck-men would be so great as to make up for the catch of 30 or 40 boats in the winter ?—Yes ; the fish would then be allowed to spawn as they like.

18,521. The flat-fish are in season until they have spawned ?—Yes.

18,522. And soles are in season after they have spawned, are they not ?—Yes.

18,523. Plaice are not worth eating after they have spawned ?—No, not for a month.

18,524. They do not at that time fetch any money in the market ?—No.

18,525. Then the trawlers do not come in here for the plaice after they have spawned ?—I think they do.

18,526. Do they catch other fish also ?—Yes.

18,527. Enough to make it pay ?—Yes.

18,528. (*Professor Huxley.*) Do you agree with this Memorial, that it would materially promote and benefit the fisheries here if the trawlers and the drag nets were prohibited being used in the bay from the 1st day of May until the 1st day of November ; would that benefit or do harm to the fisheries here ?—It would stop all the shore-fishing during that time, and that is the time when the fish are best.

18,529. I put that question to you because that was the opinion of a number of fishermen in 1817 ?—It is not my opinion now.

18,530. Do you think that that would not be the opinion of the fishermen generally now ?—Yes.

18,531. (*Mr. Lefevre.*) I suppose the coast here along the bay is not adapted for trawlers ; you have no means of sending out trawlers from this coast ?—No ; we could not send out a trawler because the water is too deep. We should not be able to get a trawler in.

The witness withdrew.

T. Hutchings.

THOMAS HUTCHINGS called and examined.

18,532. (*Professor Huxley.*) Are you a fisherman here ?—I am a fisherman from Beesands.

18,533. Are you the proprietor of any considerable number of crab pots ?—Yes.

18,534. Of a large number ?—Yes ; I have 50 or 60 pots.

18,535. Do you possess the greater number of crab pots which are owned in the village ?—No ; I do not believe I have as many as some.

18,536. Have you been engaged for many years in the crab-fishing ?—Yes.

18,537. Do you consider that it is increasing, diminishing, or remaining pretty much as it was ?—It is just as it has been for many years. There is no increase in it in this neighbourhood.

18,538. Have you any complaints to make with regard to it. Is there anything that injures the fishing to which you wish to see a remedy applied ?—

We only complain of the trawlers coming in and taking the pots away.

18,539. The trawlers come in and sweep your pots away?—Yes; in the night-time.

18,540. Is that to be prevented in any way, except by keeping them out?—No; I do not think so.

18,541. I suppose they cannot see them?—No, not in the night-time.

18,542. Cannot you take their numbers?—Yes.

18,543. Then why do you not summon them before the magistrates?—We have done several times, and they say we can do nothing with them. We have tried to proceed against them and have found that we can do nothing with them.

18,544. You have no remedy?—No.

18,545. (*Mr. Lefevre.*) What distance from the shore do you set your pots?—Two and a half miles, at the back of the Skerries.

18,546. Straight out from the shore?—Yes.

18,547. Do you set a great number together?—Yes, 20 pots will be lying together.

18,548. Do the men from here set their pots about the Skerries?—Yes, just on the back of the Skerries.

18,549. Do the trawlers come over the Skerries?—Yes, right over.

18,550. Is it rocky ground?—No, it is a sandbank.

18,551. Have you yourself lost many pots in consequence of the trawlers carrying them away?—Yes, I have lost many, and so have my sons also.

18,552. How many do you lose on the average in the course of a year?—Sometimes the trawlers will come in, and will take away two or three at a time. Sometimes they will not take any.

18,553. How many have you lost in a year?—I cannot tell. Perhaps taking a few years together I have lost 25 a year.

18,554. Have you never received any compensation from the trawlers?—No.

18,555. Have you ever obtained their numbers?—I have seen their numbers, but I have not taken them down.

18,556. Are you aware that you could recover from the trawlers?—No, they always take the pots away. We have given chase to them, and sometimes we have found that they had the pots in the trawls. Sometimes we have found the lines in their possession.

18,557. But you never took the trouble to take the number of the trawlers?—Others have done so but I never did so myself.

18,558. Is two miles and a half the furthest distance from the shore that you set your pots?—No; about three miles, up to the centre of the bay.

18,559. Do any French trawlers come here?—I never saw any French trawlers here.

18,560. Do any French fishing-boats come here?—I have seen them off the Start fishing with long-lines.

18,561. What time was that?—In the spring of the year.

18,562. What fish do they catch?—Congers and other fish.

18,563. Are there any codfish caught off here?—Yes.

18,564. How many men are engaged in crab-fishing here?—Twenty-eight at Beesands.

18,565. And how many at Hallsands?—About the same number; I cannot say how many boats there are to a boat or two.

18,566. How many pots will each boat have?—About 50; some will have more and some less.

18,567. Do you go on fishing all through the year?—Yes.

18,568–9. Have you any regulation as to the size of the crabs you take on shore?—We are not particular; but if we get a small crab we throw it away again; it is of no use to us.

18,570. What do you make in the course of a year by crab-fishing?—What do we earn?

18,571. Yes.—I cannot tell exactly. We take about $\frac{3}{4}$ cwt. a day, one day with another.

18,572. What do you get for that?—I do not know particularly; perhaps from 10*s.* to 12*s.*

18,573. Have you any complaint to make of the earnings you obtain now; has there been any falling off in your earnings?—No, they have been just the same. Perhaps they have rather fallen off than otherwise, but there is about the same quantity of fish caught.

18,574. (*Professor Huxley.*) Have you taken any notice of any other kind of fishing in the bay?—Yes.

18,575. Have you observed any falling off in the supply of other fish?—Plaice has fallen off.

18,576. When was it more abundant?—Twenty-five years ago it was very abundant.

18,577. It was very abundant then?—Yes.

18,578. And it has been falling off since then?—Yes, little by little ever since.

18,579. How far back does your memory go?—Forty years.

18,580. Then you will recollect very well as far back as the time of the committee which sat in 1817?—Yes.

18,581. Do you recollect that there was any scarcity of fish then?—There was not a great deal of difference; it was about the same as now. There were not as many fish caught then, because there were not as many inhabitants to catch them.

18,582. Up to 20 years ago, was there the same quantity of fish there had ever been?—Yes, there were plenty of fish 24 or 25 years ago.

18,583. Since then has it been falling off?—Yes.

18,584. Do you ascribe that to the trawlers?—I do not know what to ascribe it to. No doubt a great number of trawlers come in and drag away, and they drag up everything. They set their trawls, and drag for miles all over the bay.

18,585. (*Mr. Lefevre.*) How many tuck nets are there used in this bay altogether?—Three at Slapton, three here, three at Beesands, and two at Hallsands.

18,586. That is 11 altogether?—Yes.

The witness withdrew.

JOHN STEER called and examined.

18,587. (*Professor Huxley.*) Have you heard Mr. Hutchings' evidence?—Yes.

18,588. Do you agree with it?—Yes, I cannot say anything against it.

18,589. Have you anything to add to it?—I think that trawling does us great injury.

18,590. In what way?—By the men coming to drag all over the bay, and destroying both the small fish and our gear as well.

18,591. (*Mr. Lefevre.*) Are you principally a crab fisherman?—Yes, I have been a crab fisherman for the last 42 years.

18,592. Have you lost any pots by the trawlers?—Yes, in the course of the last three months I have lost 27.

18,593. Have you taken the number of any of the vessels that carried them away?—I have not been alongside to take their number. The injury is mostly done by night. We see them coming down from the Mewstone 30 or 40 of them in a night. Twenty or 30 years ago we did not see one in a fortnight, or a week.

18,594. (*Professor Huxley.*) Off and on trawling has been carried on ever since you were a boy?—Yes, ever since I was a boy, but it was not a quarter as much then as it is now. There used to be a little now and then, but I have not seen one in the bay for a week or 10 days at a time, and then there have been scarcely more than one or two; now they are here continually.

18,595. (*Mr. Lefevre.*) Do you think that in the last 40 years the trawlers have increased four times in number?—Yes; and they are trawling all over the Skerries. That is quite shoal water, and I believe

TORCROSS.
J. Steer.
21 Dec. 1863.

that they destroy immense quantities of small fish. I have been alongside of them when they have drawn their trawls up, and I have seen an immense number of small dabs and small skate just the size of your two fingers. Some of them did not seem to be alive. They were all thrown overboard by the hundredweight. I have seen that done myself.

18,596. (*Professor Huxley.*) Are the crab pots put down in any particular part of your bay?—Yes, there is only one part, just about the centre.

18,597. Do the trawlers know that?—Yes, they know exactly where they are.

18,598. Then why do they not avoid them?—They could do so. There is no considerable space of ground occupied by the crab pots. It is only $1\frac{1}{4}$ miles long, and half a mile broad.

18,599. (*Mr. Lefevre.*) Do you agree with the previous witnesses as to the decrease in the quantity of fish caught by the tuck nets?—Yes, and I believe it is owing to the use of a small-scale net.

18,600. Do you agree with them that they catch small fish?—Yes.

18,601. Considering that four times the number of trawlers are fishing here has the whole number of flat-fish caught diminished?—They have diminished much compared with 40 years ago.

18,602. Taking into consideration what the trawlers catch?—Yes, we never used at that time a mesh of less than $3\frac{1}{2}$ inches. Now when we could have used our long-lines over the Skerries we have had the trawlers come across us and drag our lines right away.

18,603. Does not the trawl go over the long-lines?—No, the trawl takes them all away.

18,604. Does not the line remain at the bottom of the sea?—Yes.

18,605. (*Professor Huxley.*) Have you had your lines carried away?—Yes, and I found out who carried them away. He said he found them and wanted me to pay him for picking them up.

18,606. (*Mr. Lefevre.*) How much of your lines was carried away?—Three lengths, 150 fathoms, were carried away by one of the trawlers. I went to Brixham and found them on board a trawler.

The witness withdrew.

The inquiry was then adjourned until Tuesday, the 22d December, at Plymouth.

Plymouth, Devonshire, Tuesday, 22nd December 1863.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman.) | G. SHAW LEFEVRE, Esq., M.P.

PLYMOUTH.
J. Buchan.
22 Dec. 1863.

JOHN BUCHAN called and examined.

18,607. (*Professor Huxley.*) Are you a fisherman here?—I am not a regular fisherman, but from my boyhood up to the present time I have had a boat, and have practised fishing as an amateur. As an amateur I have probably caught more fish than any other person in the neighbourhood. I have frequently visited the trawlers from various fishing ports. What I am now particularly desirous of saying has reference to the trawl-fishing. Some years ago Mr. Perrier was appointed by Sir Robert Peel's Government to make inquiries into these matters. Having seen a small work of mine upon the subject he called upon me and requested my assistance. I gave him all the aid in my power, and I obtained for him from the different small ports around here all he required. I believe that a bill was subsequently introduced into the House of Commons, and that it passed that House, but it was never taken up in the House of Lords.

18,608. At what time was this—to what year are you referring?—I have unfortunately no memorandum with me that states the year, but it will be about 10 or 12 years ago. I was called upon however before then—in the year 1833. That was the first time I took any particular interest in the question, and it was the first time I was asked to assist in anything of this sort. Since then I have made it a kind of hobby-horse more than anything else. Owing to the destruction that was then being committed, I thought I would commit all my information to writing. The paper, which I now hold in my hand, I had printed in May 1836. I was furnished by one of the members for Plymouth with a copy of the report on the Channel fisheries, dated the 16th of August 1833, with the appendix.

18,609. Was that the report on the British Channel fisheries?—Yes, and that report, together with what I knew personally, enabled me to draw up a paper which contained a considerable amount of information.

18,610. Are we to understand that you were furnished in the first instance with the facts contained in the report of the British Channel Fisheries Commission, and that you proceeded to add your own data to that?—Yes, I addressed the following remarks on the fisheries on the south coast of Devon and Cornwall to Sir Edward Codrington and Sir George Grey, who were the first two members for Devonport, and to the members for the West of England generally. It was first published in one of the Devonport newspapers, and afterwards I had several hundred copies of it struck off, and sent to various members of Parliament.

18,611. Will you be good enough to read the remarks contained in that paper?—It states that—"A "bill for the protection of the fisheries, and also for "the preservation of the breed and spawn of fish, "having been brought into Parliament, I am in- "duced to forward you a few observations for your "guidance on this important bill, in order that you "may be as fully prepared as possible with local cir- "cumstances connected with the subject in the "advocating the required rules and regulations for "the protection and preservation of the fisheries on "the southern coast. This is no literary production, "but the offering of one who has long witnessed with "dismay the destructive system of trawling carried "on for some years past. I find from general in- "quiry, as well as from my own personal knowledge, "that up to the close of the late war fish were always "found in great abundance on this coast, and had the "demand been even larger than it was there would "have been no deficiency; if the fisheries had con- "tinued to be conducted on the same principles as at "that period, there would have been now no cause of "complaint. Formerly the fisheries employed a great "many boats and men with hooks and lines, there "being few trawlers, but the latter of late years have "increased, and in the like ratio have the supplies of "fish increased. From calculation, the whole of the "fishing ground without the headlands is scraped "over by those trawlers many times within the year; "and when fish become scarce on those grounds, the "trawlers commence fishing within the headlands, "viz.: In bays and other shoal places, such as Caw- "sand Bay and Plymouth Sound, which has been the "main cause of the present depressed state of the "fish markets by destroying the brood and spawn of "fish." Allow me here to digress for a moment. Mr. Perrier put a question to me when he was making his inquiries which perhaps you may find it necessary to put also, namely, "what had the war to

" do with fishing?" My answer was, that during the war the Channel Fleet were occasionally anchored in Plymouth Sound and Cawsand Bay. When they had their moorings there they necessarily prevented trawling. Now, Mr. Perrier was perfectly satisfied with my explanation. In these remarks I go on to say—"It is impossible to form anything like a correct judgment of the immense destruction and injury committed by the trawlers within the headlands. I have personally witnessed the destruction on taking up the trawls in those places. Formerly excellent fish were caught with hook and line in Cawsand Bay and Plymouth Sound, and within the harbour, but now few of any description are to be obtained. It is painful to observe the now depressed state of the fisheries. Some years since the fishermen were a lively cheerful class of men, now they are full of gloom and misery, and constant applications are being made by many of them for parochial relief. This I state from personal observation, having served the office of churchwarden for two years. If asked why they cannot get the fish, the reply is, 'they are all gone;' and if asked from what cause, they with an aspect of despair say—'It is the trawlers have destroyed almost all 'all the breed by their horribly destructive system ' of trawling within the headlands.' Our markets in lieu of having a supply of good fish, cheap and plentiful, which would not only give all classes a good dinner at a cheap rate, but would be a great advantage to general trade by an increased circulation of money, and what is of more importance, would give employment to a large class of useful and deserving men, are now almost an empty space. Formerly very large quantities (after due supply to the inhabitants of these towns) were sent into the inland markets, principally of the best kinds, but now we get few of any sort for our own consumption. It is an error to suppose that the months of May, June, July, and August, are the only spawning months, and that these months only require protection from the trawlers; it is an admitted fact that nothing less than a prohibition of trawling during the whole year, within the headlands, will be a sufficient protection to the fisheries. The French have an ordonnance preventing any such fishing within three leagues of the shore, from the 15th of April to the 1st September, and two leagues from 1st of September to the 15th of April, which must be convincing that the restrictions pointed out should be provided. It is well known that different fish spawn at different times of the year, and that they spawn in the bays within the headlands, and when grown sufficiently go into deep water; and to protect the spawn the trawls must, at all times of the year, be prevented trawling within the headlands. I beg to refer you to the evidence of James Cornish, Esq. in the Report of British Channel Fisheries, 1833. You have also the evidence of Mr. Fox, of Falmouth, viz.: 'That the pilchard 'fisheries continue to the month of December, which 'is another urgent reason why the trawlers should 'not be allowed within the headlands at any season.' Great complaints were made by the fishermen on the coast about Dover, Folkestone, &c., of the French fishermen, as if they were the cause of the present decline of the fisheries on that part of the coast, but this is not the cause of the evil; it is the want of sufficient protection. What does Mr. Cornish say in answer to the Committee of the House of Commons, 1833, when asked if the French fishermen were prevented,—'That is all stuff and 'nonsense. If you protect the breed of fish, all the 'French, Dutch, and Spanish boats could do no 'harm, and would produce no sort of effect at all.' He also advocates the protection of the breeding ground from trawls during the winter as well as the summer months; see 1447 of the report. There is one part of the remedy important, which I have not yet named, viz., the size of the nets. No net should be allowed to be used by any trawl or drag-net, of less than three inches in any part of it, which net would take fish of rather less size than ought to be brought to market. With regard to the trawlers, towards whom I may be charged as wishing to do an injury, this I must deny; my desire is to benefit them as well as all other classes of fishermen. I boldly state, without fear of contradiction, that the laws and regulations which I submit, if carried into effect, would be for their benefit, and they would catch a hundred fish where they now catch one. There is another restriction which I would strongly recommend, that no fish should be offered for sale below a certain size; the exact size I am not now prepared to state, but would, if required. There was one part of Mr. Cornish's evidence I had forgotten, which is a most important description in support of my views, viz., that on going on board a trawler by accident, he saw poured out on the deck thousands of all kinds of flat-fish, turbots, soles, plaice, and fish of every kind destroyed, and all thrown back into the sea. Here was a most grievous offence. Destruction like this can only be prevented by prohibiting trawling within the headlands; millions of millions of brood fish are destroyed by this practice, for only the young and brood fish lie in shallow waters, the large and full-grown are met with in the deep waters, where trawling only ought to be allowed. In closing my remarks, I trust I shall be excused in expressing my feelings for the welfare of this important branch of trade, in the success of which I feel deeply interested. I submit this to you in the full conviction that you will render to the prayers of the petition of the fishermen of this port your kind attention and support."

18,612. These were your opinions in 1836?—Yes.

18,613. Have you since found any occasion to modify these opinions?—No, rather to strengthen them.

18,614. Has this mode of fishing been going on ever since in that way?—Yes.

18,615. Ever since then they have been fishing within the headlands?—Yes, I have seen them from Drake's Island to Cobbler's Bay; I have seen them as close in as that.

18,616. Have the trawlers gone on repeating this mode of fishing within the headlands every year?—Yes, every year since I have known them.

18,617. As I understand the evidence you have just put before us, it is to the effect that the trawling has put an end to the long-line fishing, as there are no long-liners here now?—Yes, the take by the long-line now is comparatively trifling. I can give you an instance. In Cawsand Bay I have been in the habit of going at ebb tides and always catching fish of different sorts. My man went there last week, and he got none.

18,618. What sort of fish were you in the habit of taking there?—Whiting chiefly, and flat-fish. We used to catch immense quantities of flat-fish, sometimes from 8 to 10 dozen were caught with the hook and line.

18,619. How many long-line fishermen were there from this port in 1836?—I don't know, but there were a great many.

18,620. How many are there now?—I don't know how many there are now, but I know they have fallen off very much.

18,621. Has the number of boats fallen off as well?—The number of boats has fallen off in proportion to the number of men.

18,622. On the other hand, has the number of trawlers increased?—Yes.

18,623. How many trawlers were there fishing from this port at the time you made the statement which you have just read to us?—I know myself of 20.

18,624. Do you know how many there are now?—No.

18,625. Have you any notion of the number?—I have been told that there are 80 here now.

LYMOUTH.
J. Buchan.
2 Dec. 1863.

18,626. Then the number of trawlers has steadily increased?—Yes.

18,627. And these trawlers, increasing steadily in number, have gone on fishing within the bays and headlands?—Yes.

18,628. Then it is to be presumed that they have continued to find fish there?—They find them there when they cannot get fish outside.

18,629. (*Mr. Lefevre.*) Do you mean when they cannot fish outside in consequence of bad weather?—Yes.

18,630. (*Professor Huxley.*) Then it is hardly correct to say that they have destroyed all the brood of fish there?—In saying that, I alluded to the fish in the bays.

18,631. As I understood the document which you were good enough to read to us just now, your assertion was that the trawling had destroyed the fish entirely?—Yes.

18,632. And yet they have gone on fishing in these places ever since?—Yes.

18,633. Surely it would be of no particular advantage to them to trawl where there are no fish?—There are always fish in Whitesand Bay, for instance; I think they come into the bays for protection.

18,634. What evidence have you to show that the trawling in 1836 had destroyed all the fish in the bays?—I have no evidence; it is only an assertion.

18,635. There is a wide difference between assertion and evidence; our business here is to get at the precise facts, and it would be a very important fact for us to find out that all the fish were destroyed by trawling in the bays here in 1836. Now, I cannot reconcile that statement with the fact that the trawlers have been fishing there ever since?—They only fish there occasionally; I believe they never go in there unless the weather is bad without, or something of that sort.

18,636. I think you state in that document that the fisheries were greatly depressed in 1836?—Yes, very much.

18,637. And that the fish were all gone?—At any rate it had got very scarce; last season there was scarcely a fish to be had round the breakwater, and I have often caught as many as a dozen whiting in a day about a mile and a half from the breakwater.

18,638. Have you noticed any difference in the size of the fish caught of late years in the port of Plymouth; have the fish at all fallen off in quality?—Not at all; I believe that this is one of the finest coasts we have for fish.

18,639. You have taken a good deal of interest in the fisheries here?—Yes.

18,640. What kinds of fish are brought in here by the hook and line fishers?—The hook and line fishers generally bring in whiting and flat-fish.

18,641. What kinds of flat-fish are caught by the hook and line?—Such as plaice.

18,642. Are soles caught by the hook and line?—Only rarely; I have caught a sole in Whitesand Bay, but very rarely; but I believe that all sorts of fish may be caught by the hook and line.

18,643. What other fish are caught there?—Whiting, gurnet, plaice, tubs, pipers, but they are seldom caught with the hook and line; they are generally caught in the trawl.

18,644. Are any john doreys caught here by the hook and line?—Not very often; but we have caught them occasionally. The only way you can catch them is by hooking a small fish; the john dorey comes into the bay, and swallows the small fish, and is caught himself.

18,645. Have you taken any notice of the supply of fish to the market here at Plymouth?—Yes.

18,646. Has the supply to the market increased or diminished?—It is nothing like what it was.

18,647. Do you mean the whole supply by the trawlers and the line fishermen here?—Yes; I think they make a greater price by sending the fish into the country.

18,648. I want to know whether the absolute quantity sent into the port is greater or less now than it was in former years?—It is certainly less.

18,649. Absolutely less fish in weight is brought into the market now than was brought here 30 years ago?—Yes, but we do not catch all the fish that are caught off here.

18,650. What I mean to ask is this—is the quantity of fish brought into the port less than it was 30 years ago?—No doubt of it.

18,651. The number of hundredweights is absolutely less?—Yes; for instance, hake, which we catch by the hook and line, has very much diminished. I have seen immense quantities of hake brought here, and sold at the rate of a shilling a dozen; that may be taken as a proof that the fish at that time were very plentiful; now we cannot buy them under a shilling each.

18,652. That is quite compatible with the same, or a larger supply now, if the fish are dearer; in your experience is there a smaller quantity brought into the port now than there was 30 years ago?—I think there is less, but the trawlers bring in the greatest quantity.

18,653. Although you have taken a great deal of interest in the fishing here, you have no clear idea of the number of vessels that existed here 30 years ago?—No, I cannot give you the precise number, but I should think about 20.

18,654. Now have you any clear notion as to the number of fishermen that exist in this port?—No, I was not aware that you intended to meet here until yesterday, or I should have been prepared with better information for you.

18,655. Our meeting was extensively advertised?—Yes, but I did not see it.

18,656. (*Mr. Lefevre.*) Does your experience extend along the coast west and east?—As far as Whitesand Bay to Bigbury Bay.

18,657. Has your experience shown you that the quantity of fish has equally declined in these bays as in Plymouth Sound?—I have no doubt of it.

18,658. Have you yourself had any experience in trawling?—No, none.

18,659. You have never been out trawling?—No, but I have seen the trawlers trawling. I have occasionally gone on board, but I never made it a point to go trawling.

18,660. You cannot speak then of your own knowledge as to whether the trawlers bring up spawn or not in their nets?—I have seen when the trawls have been brought up spawn upon the water like glue.

18,661. Has that spawn been brought up in the net?—Yes.

18,662. Are you sure that it was not spawn that had come from the bellies of the fish when they were drawn up?—I do not think it was. I have seldom seen a fish with a broken belly.

18,663. Was it far out at sea that you saw this?—Six or seven miles.

18,664. It was not in-shore?—No.

18,665. Have you ever heard any complaints made by the trawlers as to the quantity of fish having fallen off further out at sea; or have the complaints you have heard with regard to the diminution in the quantity of fish been confined to the quantity in-shore?—I believe they have complained of the falling off, but there are some trawlers here who will give you that evidence better than I can.

18,666. Have their complaints had reference to the number of fish they catch in-shore or outside?—During these last few years there have been no fish in-shore at all.

18,667. There has been no fish in-shore?—No, comparatively speaking.

18,668. Do any foreign trawlers come here?—No.

18,669. Do any Frenchmen ever come here?—No.

18,670. Are there any trawlers here who come from a distance?—Yes, they come from Brixham and from the westward.

18,671. Do the Plymouth trawlers go any distance

or do they confine themselves to fishing on the fishing grounds here?—They go down as far as Penzance.

18,672. Is there any pilchard fishery connected with Plymouth?—Not much.

18,673. They hardly come so far east as this?—No, we have drift-boats here, but no seine-boats.

18,674. Is there any mackerel-fishing at Plymouth? Not a great deal outside here, but the Penzance boats and others go mackereling and bring their fish in here.

18,675. Are there any boats from Plymouth that go after mackerel off here?—Perhaps there may be a few.

18,676. Have they observed any falling off in the take of fish?—I don't know, but I believe they complain of the trawlers as well as the long-liners.

18,677. I think you said that the quantity of fish brought into the market here has fallen off?—Yes, the fish I have seen in the market has apparently fallen off.

18,678. I suppose a quantity of fish is landed here that does not come into the market at all, but is sent off at once to London?—Yes.

18,679. I presume that in former days nearly all the fish caught off here were sold in the market?—Yes, until the railways came.

18,680. And the price, in consequence of the railroad, has very much gone up?—Yes. I have known bakes sell for a shilling a dozen when there has been a flux in the market.

18,681. Have you heard any complaint of the fishermen's wages having fallen off?—No.

18,682. Do you think the increased price has made up for the diminished quantity?—I have heard them complain that they get very little money, but I have never heard them complain with regard to their wages. I think, however, that the fishermen are generally paid by shares.

The witness withdrew.

Richard Stibbs called and examined.

18,683. (*Professor Huxley.*) Are you a trawler, Mr. Stibbs?—Yes, I have been, but I do not follow it now.

18,684. Are you a trawl owner?—Yes; I have been connected with trawling from my childhood.

18,685. For how many years?—Ever since I was 15.

18,686. You were apprenticed to that trade, I suppose?—Yes, I had an indenture, but I served my time with my mother.

18,687. How long have you known trawling?—Ever since that time.

18,688. Have you always worked from this port?—Not always; I went to Ramsgate at one time, when there was better doings there. Sometimes the fishing fell off here. I have been at other places at different seasons. I was at Ramsgate for three years and in Wales for three years.

18,689. Are you familiar with trawling from the port of Plymouth?—Yes.

18,690. How many trawl vessels are there here now?—I think there are 64 altogether.

18,691. Has that number increased within your experience, or has it diminished?—It has increased.

18,692. Has it increased much?—It has increased more these last 12 years, both as to the number of vessels and the size, than during all my time previously.

18,693. How many vessels were there engaged in trawling when you began to serve your time?—30; there were about 30.

18,694. How many years ago is that?—40 years ago.

18,695. And now instead of 30 there are 64?—Yes.

18,696. What was the tonnage of a vessel engaged in trawling at the time you began trawling?—They would average from 30 to 40 tons.

18,697. What kind of measurement do you refer to?—The building measurement, that is what we go by now.

18,698. What is the tonnage of the vessels now engaged in trawling?—They are now double the tonnage that they were at the time I spoke of. There are a great number of old ones still used, but as new ones are built they increase in size.

18,699. What was the cost of vessels at the time you began trawling?—From 300*l.* to 400*l.*

18,700. Did that include the fittings?—Yes.

18,701. That was the cost of a vessel ready to go to sea?—Yes; or rather say from 400*l.* to 450*l.*

18,702. What is the cost now?—From 700*l.* to 800*l.*

18,703. So that the number of vessels has doubled, and the cost of the vessel itself has been largely increased?—Yes.

18,704. What ground do you trawl upon here?—At Plymouth there is less ground to trawl over than from any fishing port in England. It varies from seven leagues east and west; that will take in all the ground. But when we go to the north we have not above three leagues of trawling ground. There are no grounds in any part of England that are so small for trawling purposes, and there are no grounds that are so constantly fished over. At Plymouth we are engaged in fishing over this ground from the 1st of January to the last day of December; it is not so at other places. In other fishing ports they have their seasons. At Ramsgate, for instance, their season is the summer season, while our vessels are constantly dragging over the ground here all the year round.

18,705. Then as I understand you the trawling ground at Plymouth occupies an area of 21 miles in length, by nine miles in breadth?—Yes, it is about nine miles to the north, and seven leagues to the south. When the fish are scarce we go a little further to the southward, but it is rougher ground, and we mostly like to keep in sight of the Eddystone. We go further out when the fish go into deep water; they get very scarce on our grounds then.

18,706. Then within your experience, which you say extends over a period of 40 years, a number of trawling vessels varying from 30 and 40 to 60 have been trawling over the grounds you mention every day?—Yes, when they have had wind and weather.

18,707. And Sundays excepted?—Yes.

18,708. What is the practice of your vessels; do you come in every night or do you stay out?—In the winter time we stay out two days. We are then engaged in sole fishing which we get chiefly in the night time. In the summer time our vessels generally go out in the morning and come in again at night.

18,709. Do you follow that practice because it is better for your market to do so?—Yes.

18,710. What is the size of the trawl beam that you use?—Our trawl beams are generally about 45 feet long now. Some of the boats have them 42 feet long.

18,711. Have all the vessels in this port a beam 45 feet long?—No, the small trawlers will hardly work a 45 feet beam. They used to have them 30 feet long, but now the beams are worked outside the vessel, and the length of the beam is generally governed by the size of the vessel itself.

18,712. Then, in point of fact, the beam of the trawl and the length of the vessel are in proportion the one to the other?—Yes.

18,713. And it would be injurious to you if you could not make your beam in accordance with the length of the vessel?—Yes, it would be a very great injury to us indeed.

18,714. What is the smallest size that you have the beam now?—40 feet. I think that no vessel has a beam less than 40 feet now.

18,715. Have you any notion that the whole of these beams are illegal?—Not at all.

18,716. Did you ever hear of a Convention between France and England in reference to the fisheries?—No, I never heard anything as to the length of the beam that was to be used.

18,717. Is there anybody here to look after the

PLYMOUTH.

R. Stibbs.

22 Dec. 1863.

trawlers?—There has been a steamer here to look after the Frenchmen.

18,718. Do the Custom-House officers, or the Revenue officers, ever pay any attention to your trawls?—No.

18,719. Did you ever have the length of your beam measured?—No.

18,720. Would you like to have a regulation enforced that the beam of your trawl should not be more than 38 feet long?—No; England has gone on improving so much of late years that it would be hardly beneficial to compel us to go back again. You might just as well confine an angler fishing in a river to a certain length of rod, as confine us to a particular length of beam.

18,721. If you were compelled to have your beam 38 feet long only, there would be no encouragement to you to build large vessels?—No, certainly not.

18,722. (*Mr. Lefevre.*) Have you ever heard of the regulation that the length of your beam should be 38 feet?—I have heard it spoken of at Brixham that there was a certain fixed length of beam, but I never knew that it was acted upon. Indeed it must be very injurious, and not consistent with our notions of right and wrong. England has always been for improvement, and for a man to say to a trawler, "You "are not to have a large beam, but must fish with a "small one," would be a very great hardship.

18,723. (*Professor Huxley.*) We say nothing about the "hardship" of the existing law; our object is simply to ascertain the operation of that law and its bearing on your interests. I may tell you, however, as a matter of fact, that by the existing law you are bound to have your beam 38 feet long only?—Is there an Act to that effect?

18,724. Yes, and I wish to ascertain if it is carried into force?—No, it is not.

18,725. Can you tell me what is the reason that there should be a proportion between the length of the beam and the length of the vessel?—We like to have the beam come alongside of the rigging. Now that the vessels are larger they are brought up right on-board.

18,726. You like to have the fore end of the beam come on to the fore shrouds?—Yes.

18,727. That enables you to check the fore end of the beam?—Yes.

18,728. Under other circumstances, would you be liable to have your deck swept by the beam if there happened to be a wind blowing?—Yes.

18,729. What is the size of the mesh of your net?—We vary in size, but I believe that the size of our nets is larger than that of any other trawl net in England.

18,730. What is the size from knot to knot?—From three to four inches.

18,731. What part of the net is that?—The square of the back, the wing.

18,732. What is the size at the end of the net?—I should think that would be two inches and a half from knot to knot; that is the smallest part we have in the net.

18,733. Supposing you thought it would contribute to your interest to have the mesh smaller, would you make it smaller?—Yes, if we thought it would be to our interest.

18,734. Are you aware whether there is any regulation upon that point?—Yes, I believe there is a regulation for all the fisheries.

18,735. If you thought it would contribute to your interest to have the mesh an inch from knot to knot, would you think there would be any harm in having it so; are you aware of any law to prevent you from doing so, if you found it advantageous?—I believe there is a law. I believe there is a sized mesh fixed by Act of Parliament.

18,736. But does any Custom House officer, or Revenue officer here, examine your mesh to see whether it is of the right size?—No, there was a talk about it some time ago, but it was dropped again.

18,737. Are all your boats numbered?—Yes.

18,738. By whose authority is that seen to?—By the Custom House.

18,739. Do you carry any particular kind of vane?—Yes, until it blows away; we generally carry a red vane.

18,740. Do you carry the vane of any colour you like?—We generally have it red.

18,741. Do you know any reason why you should not have it blue?—I believe the French have it blue.

18,742. Is there any drift-net fishing going on here?—Yes, more than ever there was.

18,743. Do you ever come into collision with the drift-net fishers?—Yes, sometimes.

18,744. That has happened within your own knowledge?—Yes.

18,745. If you are towing your trawl, and you happen to come across a fleet of drift-net men, what do you do?—We let go the stopper and get the trawl up.

18,746. Suppose they shoot astern of you, what do you do?—If they shot astern of us, and we could get clear, we should not foul at all.

18,747. I am only desirous of ascertaining how far the law is carried out here?—And I am anxious to tell you the truth. You may depend upon it that I will not tell you any falsehood.

18,748. We are anxious to ascertain all the facts. Now, with regard to getting your trawl up and getting away when you come across the drift-net fishermen, have you ever heard of any law on that subject?—Yes.

18,749. Do you know what that law is?—The trawler is bound to get out of the way of the drift-net fishermen. That at times is a very great hardship. Nine-tenths of the fishermen now are trawlers. If the trawlers now and then in the course of a season come foul of one another there is seldom any quarrel. They clear their nets, and if any damage has been done it is all set right again. But they never expect one boat to haul the net up and go away out of the way of another.

18,750. Are there many long-line fishermen in this port?—More than there ever were engaged in bultering, what the Frenchmen call long-lines. There used to be a few boats go off the Start with long-lines.

18,751. With snoods?—Yes.

18,752. The hand-line fishing is carried on to a greater extent than ever it was?—Yes.

18,753. Do you ever come across the ground where the long-line fishermen have laid their lines?—No.

18,754. Do they lay their lines on your ground?—No, they lay them on ground on which we could not go.

18,755. Have you ever heard of the trawlers sweeping over the long-lines and taking them up?—No.

18,756. Is there any great crab-fishing off here?—No; we catch some in the trawls in rough weather. In wild weather they come out from the foul ground, from the rocks, and we catch them. As far as the she crabs are concerned, we sometimes catch a great many of them in the night time.

18,757. I am not talking of catching crabs in the trawl but of catching them in crab pots?—I believe that crab pots are set on the rocky ground.

18,758. What kind of fish do you mostly get with the trawl?—We catch in the trawl turbot, plaice, brill, soles, doreys, skate, ray, and thornbacks.

18,759. Can you give me a rough notion of the proportion of fish that there will be on the average in one haul of the trawl. Of what kind of fish do you get the most?—The most fish we get at times is the hake. At other times we get most big tubs.

18,760. What is a tub?—It is a large specimen of the gurnet. We sometimes get great abundance of it.

18,761. What kind of fish do you get in the greatest abundance next?—Hake and tubs are the most we catch.

18,762. But after these?—We get a great many

gurnets at times. Flat-fish are never very abundant or plentiful.

18,763. Do you get many soles?—Sometimes we get a great quantity of soles, but never more than once or twice. We call one or two baskets a great quantity of soles to catch.

18,764. Do you get many halibut here?—Halibut is a large fish. They here call a brill a halibut. We seldom get a Newfoundland halibut, but we get a good many brill. Halibuts are very scarce, but sometimes we get a halibut, and occasionally a sturgeon. They are, however, very scare.

18,765. How long have you your trawl down at a time?—About six hours—a tide.

18,766. When you haul up your net, in what condition do the fish come up?—They are always in pretty good condition.

18,767. Do they come up alive?—Yes, a great many of them.

18,768. Are there a great many dead?—Some of them are. The gurnets will all be dead, and sometimes a sole, but all of them are in good order.

18,769. Are they very much bruised?—I have never seen them much bruised. If we get a misfortune and have a stone in the net, some of them will sustain injury.

18,770. How long does it take you to get your trawl on board in heavy weather?—Sometimes two hours, but in fair weather we can get it up in three quarters of an hour.

18,771. When you are as long as two hours taking in the net, does it not often happen that the fish are very much washed about?—No, not unless there is a stone in the net.

18,772. Do you gut your fish as soon as it comes on board?—Sometimes we do.

18,773. Do you ever observe that the gall bladder is burst?—No.

18,774. You have never seen that?—I have in some cases seen the bladder burst when they have been gutting them.

18,775. But it has not been burst in bringing the fish up in the trawl?—No.

18,776. You have never seen the fish so much bruised as to be rendered unfit for the market?—No.

18,777. Do you get as good a price for your trawl fish as the long-line fishermen get for theirs?—The trawlers do not get the same kind of fish as the long-line fishermen.

18,778. (*Mr. Lefevre.*) What kind of fish do the long-line fishermen catch?—Mostly codfish, skate, and ling.

18,779. Do they get many codfish?—Now and then they have a good take.

18,780. (*Professor Huxley.*) Do you ever bring up spawn in your net?—I never saw any in it, more than that which was in the fish.

18,781. Do you mean the fish spawn squeezed out of the fish themselves?—Yes. The hake is the fish that we catch in the greatest quantity, and I really do not know what the spawn of the hake is.

18,782. Do you get a large quantity of small unsaleable fish?—Sometimes we have got a large quantity of small gurnets, but we do not take them in; the crab-pot men take them. We used to throw away all the small rays and skate, but now they are used for the crab pots.

18,783. Have you not heard it stated that the trawlers catch a large quantity of small fish that is of no use for the market, and that it is thrown overboard?—Yes, I have seen it so stated.

18,784. Is that the result of your experience?—No, nor has any one experienced it anywhere else.

18,785. The great proportion of the fish you get is all saleable, marketable fish?—Yes.

18,786. Within your knowledge, what has been the increase in the quantity of fish brought into the port of Plymouth?—When I was a boy there were two fish carts that used to go from here; one of them went from the London Inn.

18,787. You are speaking now of 40 years ago?—Yes. An old gentleman of the name of Cornish used to take the best fish, and send it to London, Bath, and other places. There were two carts that went away then in the course of a week.

18,788. What amount of fish did they carry?—Two horseloads each.

18,789. What weight would that be?—10 or 12 cwt., or perhaps from 12 to 15 cwt.

18,790. Suppose we take it at a ton?—That would be the outside.

18,791. Were they two-wheeled or four-wheeled carts?—They were light carts built for the purpose. Some of the fish went to Bath and Bristol, and some of it was posted as far as London.

18,792. How often did the carts go?—Twice a week. The boats then used to go out in the early part of the week, and come in on the Wednesday afternoon, and they would come in again on the Friday afternoon.

18,793. What is the average quantity of fish brought in now?—Why, where 1 cwt. went away when I was a boy, there are tons and hundreds of tons going away in a week now. The quantity of fish sent away has enormously increased.

18,794. What is the average you bring ashore in your boat?—I am not able to tell you that, it varies so much.

18,795. But cannot you give us a fair average, taking one week with another?—Sometimes a boat will bring in five or six maund of fish.

18,796. How much is a maund?—The maunds now are getting smaller than they used to be. Formerly they held 24 hake, and now they hold only 15 or 16.

18,797. But what is the weight; how many cwt. would you catch in a fair day's fishing?—Sometimes a ton and a half, that would be a very good catch; it would be about 30 maunds. A maund will hold nearly 1 cwt. Then perhaps on other days they would only bring in 3 or 4 cwt.

18,798. Would three quarters of a ton be a fair average?—Yes, or rather say half a ton.

18,799. How does that fish go away from Plymouth now?—There is a great deal of the coarse fish taken away into the country by hawkers.

18,800. Do you send much to London?—We send a great quantity of hake sometimes, and the greatest part of the prime fish goes to London, Bath, and Bristol.

18,801. Is it sent away by railway?—Yes.

18,802. Do you think the railway returns would help us much to understand the quantity of fish brought into the port?—Yes, I think they may.

18,803. But, as I understand you, a large proportion of the fish would not be accounted for in these returns?—A large proportion goes away to different parts. They branch off between this and Exeter. The greatest portion of what used to go away by carts now goes off by rail, but a great deal also goes by cart to Bolt Tail, and Saltash, and all round.

18,804. What makes you go to fish in the bays at times?—We have but little bay-fishing here. The boats go into Whitesand Bay sometimes, and I should say it would be a great deal better if they did not.

18,805. But, as a matter of fact, they do go there to fish?—Yes, they do at times, but very little.

18,806. Why do they go there?—When they are lying outside in the summer time trawling for hake just off Plymouth, and down as far as Fowey, if a wind comes in the night time off the shore from the northward, they go into Whitesand Bay and make a haul, while at the same time they are in the calm out of the bad weather. But it is not two or three times in the course of a year that they go into the bay, and then only when they cannot fish outside.

18,807. Have you ever been fishing in Whitesand Bay yourself?—Yes.

18,808. Have you found that you have brought up a large proportion of small fish at that time?—Yes.

18,809. Then I presume it is not to your interest to fish within the bays if you can avoid it?—Not at all. I think it is a great pity that we should ever go

PLYMOUTH.

R. Stibbs.

22 Dec. 1863.

there. In Whitesand Bay I have seen scores of small turbot and small soles taken up.

18,810. At what particular time of the year do you get most of the small fish?—We get small fish at all times of the year, but sometimes we get it in greater abundance than at others. Sometimes there is no fish outside, and then we go into the bays.

18,811. It is commonly small fish that you get there?—Yes. It is not the same in all the bays. I have been in Mevagissey Bay; there are very fine fish to be got there, but they are all small fish in Whitesand Bay.

18,812. You are not yourself concerned in the long-line fishery?—No; with regard to the spawn I think it is not all kinds of fish that have spawn. The ray has a kind of purse. The gentleman who gave evidence just now says he has seen spawn brought up. Now I have never seen any. All I have seen brought up has been a sort of white dirt in the bay that we call "skulch." In Wales, in Carmarthen Bay, we could hardly haul up our trawls for a kind of blubber stuff that they have there. I have seen that brought up, and also a flimsy sort of thing which we shake away, but I have never seen any of what you call real spawn. The hake has a spawn, and so has the plaice, but they do not spawn where our trawling is carried on. They do not lay their spawn carelessly on any sort of ground; they require a quiet place on which to deposit it and in which to breed their young. I believe it is impossible for any fish to be caught with a trawl net where they deposit their spawn. If they shot their spawn and had their brood upon our trawing ground we should clear it all off in a week. Down at the northward I know they say that our fishermen here have swept our own coast and are now going there, and that in three years we shall sweep all the fish off theirs. Now I think that cry has originated in nothing but a desire for monopoly on their part. They and the herring fishers wish to have the fishery to themselves and to drive away all the trawlers. In other places they complain of the seines, and they want to do away with the pilchard fishery down at St. Ives. If they could only succeed in that, these long-line fishermen would have no further opposition. It is a downright monopoly that they desire and nothing else. I have seen a paper published by some one or other in which he wants to have all the trawling put a stop to, and whoever he is I think he ought to have his ears cut off.

18,813. When you have been trawling off this ground, have you ever seen as many as 40 sail of boats trawling on the same ground?—Yes.

18,814. Are you obliged to keep pretty much in each other's track?—Sometimes we get foul of one another. One may want to get ahead of another. Sometimes I have seen 60 vessels towing their trawls off Looe, so near together that they could halloo from one to the other. Now if a sovereign had been at the bottom of the sea when they were trawling over it one after the other I think it would have been picked up, let alone spawn.

18,815. Under such circumstances did you ever find that the headmost vessel caught more fish than the sternmost?—Perhaps they do sometimes. They think they do catch more when they are first; but sometimes I have seen the sternmost vessel get the most fish.

18,816. Then you do not think it makes much difference whether a boat engaged in trawling is fishing first or last?—I would rather have the headmost berth. It is the same in that as in all human nature, we all like to be first. But the boats a little further astern and even the sternmost often come better off.

18,817. Having known the fishing ground you speak of for 40 years are you able to say whether there has been any falling off, or whether there is still as much fish now as you were in the habit of getting in your early days?—There is as much now as we used to get, but it varies at times. I can honestly swear to the truth of what I say, and I never swear to a falsehood. At Brixham during the last two months they have had great takes of fish. That is the place from which all these men have gone who have gone down to the northward and who they say have caught all the fish on the coast. They are the men who have gone to Hull where there are now about 300 vessels. The long-line fishermen there say that they have caught all the fish on their own coast and that they have killed all the spawn. Now at Brixham within the last two months they never had more fish than they have been taking. There is an old saying that it is of no use to carry coals to Newcastle. But a few months ago a Brixham vessel came in here with a very large quantity of hake, and the consequence was that it knocked the price of that fish down to a shilling a basket.

18,818. You have been trawling here for a number of years?—Yes.

18,819. Then I presume that you know most of the trawl owners?—Yes.

18,820. Is it a common thing for a man to begin life as a fisherman working on board a trawler, then by-and-by to save money and get a share in a trawl boat, and ultimately to become the owner of a trawler is that a common occurrence here?—Some of them do it at times, but it depends on perseverance. He is a very lucky man who gets on in that way and succeeds in getting his own vessel; he must be a very industrious and persevering man. I never saw a lazy man in my life that was accounted a lucky man. A man must persevere, and then he stands a very good chance of doing well. At this very time there are many men who will get a good living while others will not.

18,821. Are the owners of the trawl-vessels here for the most part fishermen themselves, or do they live on shore?—There are a great many vessels owned by fishermen, but there are many of the owners also who live on shore.

18,822. Are they people who have saved money and invested it in trawlers?—Yes.

18,823. (*Mr. Lefevre.*) Are they people who have saved money in their professions, and put it in trawlers?—Yes, and I believe that they are very sorry for having done so. I think there is a gentleman now present who will quite agree with that.

18,824. (*Professor Huxley.*) Is he sorry that he has invested his money in trawlers?—Yes, I believe he is.

18,825. Why does he regret it?—Because they have not paid their way. It requires a fisherman to make a trawl-boat answer, and he should be a young man also. If he is a fisherman, and is steady and persevering, he will get on, and probably obtain part of a vessel. By-and-by he may get one or two of his own, but that is the extent to which he goes, and as he gets old he will find that his profits will diminish. I do not think there is anyone who will ever make a fortune by trawling alone.

18,826. One man whom we examined at Brixham stated that most of the wealthy men about Brixham had made their money by trawling?—I do not think they made it by trawl-net fishing.

18,827. If the number of your trawl-boats has increased from 40 to 60 within the last 40 years, and the expense of the vessels has doubled, the money must have come from somewhere?—Yes, but during the last few seasons we have had very bad years. During the last winter we have lost great quantities of fish in consequence of calms. Our boats are not like steamers. A fisherman must have a wind in order to enable him to tow his net. Then again, we are liable to meet with heavy gales; there has been a gale recently, and a great deal of damage has been done by it. We cannot fish in a heavy gale any more than we can fish in a calm.

18,828. Do you think that the great drawbacks to trawling here have arisen from the weather?—Yes, I do.

18,829. And not from any falling off in the supply of fish?—No, I think we have suffered more injury from the weather. If we had had weather, I believe

we should have been able to have got as much fish as ever we got.

18,830–1. (*Mr. Lefevre.*) Are you yourself the owner of trawl-boats ?—Yes.

18,832. How many have you ?—We are two brothers and two sisters-in-law, and we have 10 vessels altogether engaged in fishing among the four of us.

18,833. Did you begin life as a sailor ?—Yes, I commenced as a fisherman.

18,834. And did you save money ?—Yes, I got on by perseverance in the first place ; then, after I got one vessel, I got more by buying and running the fish into market than I ever did by catching them. I used to take the fish to other markets where there were railroads.

18,835. I believe you do not go to sea now ?—No, I do not.

18,836. How long is it since you have been to sea ?—I have not been to sea for two or three years, but I have been a pilot for some years.

18,837. Do you find that you make a good profit by your trawling ?—There are some of the vessels we have that do not pay their way, but then again we have others that do.

18,838. Do you find that the large boats pay better in proportion to their size and cost than the small ones ?—Yes, we can always command better crews in large vessels.

18,839. Do you pay by the share ?—Yes, the money goes in seven shares ; the master gets one and a half.

18,840. How much does each of the men get ?—Each of the two men get a share ; the boys' shares belong to the owner.

18,841. What share goes to the owner of the boat ?—Three shares, so that if they get 7*l.* three shares out of that will go to the vessel or to the owner of the vessel. I have known many a man leave a small vessel in which he had the skipper's berth, and go as second hand in a larger boat.

18,842. Do you find that the large boats catch more fish than the small ones ?—Yes, they have a larger beam, and they can stay out in worse weather. If we were forced to have a beam of 38 feet and a smaller boat, it would do us very great injury. Everybody now-a-days is for improvement, and I think it would be very hard if the fishermen were to have restrictions placed upon them.

18,843. Do you think it would be unadvisable to be restricted to a 38-feet beam ?—Yes, it would do us great injury. I think it would be very unfair to say that I with a large boat should not have a larger beam than another man with a much smaller boat.

18,844. Do these men you speak of mainly confine themselves to fishing off the harbour here ?—Yes.

18,845. Do they fish in Whitesand Bay ?—Yes.

18,846. And in Bigbury Bay ?—Not often.

18,847–8. Do they ever go to Start Bay ?—Never. A Plymouth fisherman is a home fisherman ; he seldom goes anywhere else.

18,849. Do your fishermen fish in the night-time ?—If there is no wind in the bay they do, but in the summer time they will try the hook to catch hake.

18,850. Do they catch the most fish by night or by day ?—At night, if there is any wind, they will catch hake, which swims at the bottom.

18,851. Do you catch a different kind of fish at night from that which you catch in the day ?—Yes.

18,852. I understood you to say that it is against the interest of the fishermen to go into the bays to fish ?—Yes, I think it is greatly against their interest to go into Whitesand Bay. They catch there a great deal of small turbots and small soles.

18,853. Do you think that the catching of these fish diminishes the fishing generally ?—No, I have not observed any diminution, but if they were not taken when they were small they would become bigger, and we should catch them then when they were really worth selling. I have often heard a fisherman say, when he has brought up one of these small fish alive, "Heave he overboard again ; we may not get him, "but somebody else may."

18,854. Then am I to understand that you do not want to fish within the headlands ?—No, I do not.

18,855. Do you think the trawlers generally would not object if they were prohibited from doing so ?—I do not think they would object.

18,856. And it would be the same with regard to Whitesand Bay and Bigbury Bay ?—Yes.

18,857. Do you trawl much in the harbour, or rather in the Sound ?—Not once in a month ; not five times in the course of a year.

18,858. Do you trawl in Cawsand Bay ?—Yes, sometimes. There used to be fish in the Sound years ago, but after the breakwater was built they became very scarce, and there are not many fish to be found in the Sound now.

18,859. Do you think that trawling has had anything to do with the diminution of the fish in the Sound ?—No.

18,860. Have you ever heard any complaint of the fish having fallen off in Whitesand Bay and Bigbury Bay ?—Not at all ; sometimes they can go and get fish there, but at others they cannot.

18,861. Do you observe that you catch a larger proportion of fish at particular seasons in these bays ?—No, I have never observed that myself, but I never fished but once in Bigbury Bay in my life.

18,862. Do you think any difference is made by the particular time of the year at which you fish in the bays ?—No, I think if we were restricted from fishing in the bays some injury might be done. There are bays where very fine fish are constantly caught ; for instance, there is Whitby Bay and Rye Bay.

18,863. Do you know anything of the trawling in Start Bay ?—No, I never was trawling there. I have laid there at anchor, but I have never been trawling there.

18,864. Do vessels come from a distance to fish here ?—Yes, I think we are pestered more at Plymouth than at any other place.

18,865–6. Where do the boats come from ?—From Brixham and from the west.

18,867. Do any Frenchmen come here ?—Yes, at times.

18,868. Do they fish in-shore or more out at a distance ?—They fish in a line from Mewstone up to Start Head ; they are not engaged in trawling, but they fish upon the rocky ground.

18,869. Do they ever come here to fish for mackerel in the night time ?—Yes.

18,870. Do you come across their nets when you are fishing near them ?—At times ; not often.

18,871. In fishing off the Start do you ever come in contact with the Brixham trawlers ?—We may get foul sometimes, but not very often.

18,872. (*Professor Huxley.*) Did I understand you to say that your impression was that trawling may still be made to pay well if carried on by a man who is a trawler ?—Yes.

18,873. It would pay a trawler to work his own vessel ?—Yes, I think any young man, with perseverance and industry, if he has a trawl of his own, will make a living and pay his way.

18,874. But on the other hand you do not think it is a good speculation for persons who are not fishermen themselves, and who would have to pay others to work for them ?—No, I do not think it would pay them.

18,875. Like all other businesses, if a man knows something about it he is more likely to get a return for his money ?—Yes.

18,876. (*Mr. Lefevre.*) How far south do you trawl ?—It depends on whether there is scarce fishing. Seven leagues is generally as much south of the Eddystone as ever we go.

18,877. Do you find rough ground if you go further off ?—The further we go off we get faster to the bottom. It may not be all rock, but if we go much further out we are apt to tear our craft.

18,878. What is the greatest depth of water that you fish in ?—About 40 or 45 fathoms.

18,879. Not deeper than that ?—There is not much

PLYMOUTH.

R. Stibbs.

22 Dec. 1863.

deeper water than that across from here to the French coast. If we go further off, although the ground is rough, we get great catches of fish. We think that the fish go there and spawn, because they can find quiet places there for that purpose.

18,880. Do you think that the fish spawn out in the deep water?—Yes, I think the deep-sea fish spawn in the deep water.

18,881. Do you think that the young fish come inshore?—I have seen small soles and turbots in Whitesand Bay, I have seen them very small, but I have not seen any other small fish to speak of.

18,882. Do you throw overboard any of the small fish you catch?—Sometimes we throw over little gurnets. They are quite fit to eat, but it would be a great trouble to clean them, and therefore we throw them overboard.

18,883. Do you throw overboard any large quantity of that fish?—No; just a basketful at times. There is no great abundance brought up in our trawls, and of spawn I have never seen any at all. I have seen a great deal of spawn inside the herring boats.

18,884. Have you ever sold any small fish for manure?—No, never.

18,885. (*Professor Huxley.*) Can you tell me whether there is any particular difference between the price you get now, on the average, for your trawl-fish, as compared with what you got for it 20 years ago?—No; it depends a great deal on the quantity we catch; 40 or 50 years ago the fish were quite as dear as they are now, sometimes they were dearer then. With regard to soles, we had a particular size at which we sold them; we had a measure of 12 inches. If they were 12 inches long they were called tailed soles, and they would fetch 3*s.* a pair. Turbots were all sold by weight. I have seen 6*d.*, 8*d.*, and even as much as 2*s.* 6*d.* a pound given for turbots four years ago. Now they are sold by hand. Two or three months ago we had great quantities. Each boat would catch five, six, eight, or ten, and one boat had eleven in one day, and then they did not average more than 3*s.* each. With regard to doreys, there were quantities caught here two months ago—greater quantities than have been caught within the memory of the oldest fisherman. Of course the consequence was that they sold very cheap.

18,886. Then, if I understand you rightly, the average price you get now, or rather the average price you have got for fish during the five past years is not sensibly greater than it was for the five years taking 20 years previously?—Not at all; but there are exceptions. For instance, the fish have made more this morning on the quay than they generally do make. Turbots have brought more than they have brought for years; they have made as much as 17*s.* or 18*s.* apiece. Of course the buyer knows the state of the market in London. He can soon get a touch of the telegraph wire and know everything that is taking place, and whether he would be justified in giving a high price for the fish. All I know is, that the turbots this morning have been sold for from 17*s.* to 18*s.* apiece.

18,887. We are not interested in these exceptional prices; all that concerns us is the average price?—I should say that the average price is not greater than it was when I was a boy. When it is higher it is merely owing to some difference in the catch. Bad weather, for instance, makes the fish sell higher. If they are unable to fish out from Hull, if they have bad weather there, we soon hear of it, and then we are sure to have good markets; but taking it altogether, on the average it does not bring us more in than it did in former times, and sometimes not so much. It has only been within comparatively recent years that there have been so many vessels fishing from Hull.

18,888. (*Mr. Lefevre.*) Do you think that every trawler brings in as many fish as he did 20 years ago or more?—Taking a fair day's fishing, he may bring in rather more. But of course there are a great many more boats, and altogether they bring in a considerably larger quantity.

18,889. The boats have also doubled in size?—Yes. If the boats that existed in former years, even when I first started fishing, had been in the habit of catching as much as they do now they would not have been able to get the fish to the market. Now we can send it by train, whereas they could not have sold it then at all.

18,890. Are your prices more equal now than they were formerly?—Yes, I think they are.

18,891. You do not think that each boat brings in more than a boat did 20 years ago?—No; but still a great deal more comes ashore altogether.

18,892. Notwithstanding the fact that the boats have increased in size?—Yes, notwithstanding that, they do not catch more than they did then, although they are so much larger. But ours is naturally a small fishing ground. We are continually fishing over that ground, 50 or 60 of us at a time. Of course all of us would hardly take as much fish per boat as only 10 fishing there formerly would take. But still there is a great deal more fish brought ashore at Plymouth than there ever was.

18,893. Do the vessels of a larger size stay out for a greater number of days than the smaller ones?—No.

The witness withdrew.

T. Foster, sen.

THOMAS FOSTER, sen., called and examined.

18,894. (*Professor Huxley.*) Have you been a fisherman from this port?—Yes.

18,895. For how many years?—For 47 years.

18,896. What kind of fishing have you practised?—Always trawling.

18,897. You have never been a drift or line fisherman?—No.

18,898. Have you heard the evidence of the last witness, Mr. Stibbs?—Yes.

18,899. Do you generally concur in the statements made by Mr. Stibbs?—Yes, I do.

18,900. Have you any comment to make upon the evidence which he has given us?—No.

18,901. Then you agree altogether with what he stated?—Yes.

18,902. There is nothing of any kind that you wish to add?—Nothing more than that I think the boats ought to be kept out of Whitesand Bay. I believe that the turbots go in there to spawn.

18,903. Do you think that the working of the trawl in Whitesand Bay is injurious to the fishing?—Yes.

18,904. Do you think that it is injurious to all the fishing as well as the trawling?—Yes.

18,905. What is it that renders it injurious?—I think it does a great injury in consequence of the boats catching small turbots and small soles. The shrimp trawlers also hurt the fish as much as anything. They catch a terrible lot of small fish, sometimes no longer than your thumb.

18,906. Is there anything else you wish to add?—No.

18,907. (*Mr. Lefevre.*) Do you find that the summer or the winter season here is the best for trawling?—They are both pretty much alike.

18,908. You have never observed any great difference in that respect?—No.

18,909. Have you noticed any falling off in the number of fish caught by the trawlers?—No. The fish come in regularly in their season, the same as our hakes and gurnets. They come in quite right in the season.

18,910. Do you think that each trawl catches as many fish as were caught by a trawl-boat, say 10 years ago?—I think it does.

18,911. Then the fishing in Whitesand Bay has not caused any diminution in the quantity of fish

T. Foster, sen.

22 Dec. 1863.

caught?—I think they have not been there so much during the last two years, and during that time there have been a great number of turbots caught.

18,912. Have more been caught since the trawlers went less into Whitesand Bay?—Yes.

18,913. Is there a great deal of shrimping carried on in Whitesand Bay?—Yes.

18,914. And in Cawsand Bay also?—Yes, but not so much. From Rame Head down to the Wrinkle shrimping is carried on, and I think all along that way is a nursery for turbots.

18,915. Have you trawled in the Sound?—Yes.

18,916. Do you agree in the statement that the number of fish caught in the Sound has diminished?—No, I have not observed that.

18,917. You do not catch less fish there?—No.

18,918. Do the trawl-boats go there as much as they did formerly?—Just about the same.

The witness withdrew.

WILLIAM FREDERICK COLLIER called and examined.

W. F. Collier.

18,919. (*Professor Huxley.*) Are you engaged in the fishery here?—Ours is a very old house in Plymouth, and my father before me used to hold large shares in the pilchard fisheries both in Cornwall and Devon.

18,920. In the seine fisheries?—Yes. We used to export the pilchards to Italy. The shares in these fisheries have descended to me, but none of the profits. I only wish to remark that I have had shares in pilchard seines in Bigbury Bay, Whitesand Bay, at Looe, and at Menabilly, but they have had no catches there of any great importance for years. The catches have begun to diminish very much to the eastward. We first lost the fish in Bigbury Bay, then in Whitesand Bay, and lastly in Menabilly. At St. Ives there are still very large catches, but as we come eastward they have gradually fallen off. I have heard my father say that in the olden days the catches of pilchards to the eastward were enormous. Very large quantities indeed were caught in Bigbury Bay.

18,921. Have you any notion of the cause of the falling off?—Not the least.

18,922. Since your father's time have the drift-net fishers become more numerous?—Yes. All the fishermen below have drift nets, and they always have had I think. I do not know what is the cause of the falling off.

18,923. Do you happen to know on what part of the coast the drift-net fishing first begins, westward or eastward?—No.

18,924. You have never yourself had property in drift nets?—No.

18,925. The pilchard seines are very expensive, are they not?—Yes, they cost a great deal.

18,926. What is the average cost?—I cannot tell what the cost of a new one is. I have only had to deal with them since they have been old. But I think you will get all the information you require in reference to the pilchard fishery in Cornwall. I believe that the whole plant of a pilchard fishery is very expensive indeed. There are two or three large seines, and the tuck net, and two or three large boats required.

18,927. Do you think that the total supply of pilchards altogether has fallen off?—Yes, because the quantity caught with the drift nets cannot be compared with the quantity caught by the seines. One inclosure by the seines has filled 20,000 hogsheads.

18,928. Are you concerned in the exportation of pilchards now?—I have been within the last six or seven years, but am not now.

18,929. Have the pilchard fisheries become a bad property in consequence of the fish having fallen off?—Yes.

18,930. (*Mr. Lefevre.*) Have you no means by which you can account for the falling off?—No.

18,931. Do you think that trawling in Whitesand Bay or in Bigbury Bay has had anything to do with it?—I cannot give you any opinion, and I think that most of the opinions that you have had are merely guesses, and not scientific opinions at all.

The witness withdrew.

THOMAS FOSTER, jun., called and examined.

T. Foster, jun.

18,932. (*Professor Huxley.*) Are you a fisherman here?—Yes.

18,933. How many years have you been engaged in the fishery here?—About 24 years.

18,934. Have you always fished from this port?—Yes.

18,935. In what kind of fishing have you been engaged?—In trawling, and I have drift boats and long-line boats as well.

18,936. Then you are interested in all kinds of fishing practised here?—Yes, although I have myself only been trawling.

18,937. You have heard the evidence which has been given by Mr. Stibbs touching the trawling?—Yes.

18,938. Have you any comment to make upon that?—Nothing, except with regard to the length of the beam.

18,939. What do you think upon that point?—The vessels we have now-a-days would not do with a 38-feet beam. They would trawl a beam of that size so fast through the water that they would have no means of stopping it.

18,940. Then you agree with Mr. Stibbs in the conclusion he came to, that it would be injurious to the trawl fishermen to be compelled to use a 38-feet beam?—Yes.

18,941. Then if the present convention were put in force you would be sufferers?—Yes. A little vessel of 45 tons would be better off than a large one of 60 or 70 tons that costs double as much money.

18,942. Have you any particular weight for your head irons?—Yes.

18,943. What is the weight you have?—Three hundred-weight.

18,944. Three hundred and thirty-six pounds?—No, 300 pounds. We do not go by hundred-weights.

18,945. Have you ever heard of any regulation upon that point?—No.

18,946. Would you think it a hardship to be required to use any particular weight?—Yes, and I can give you my reason. Some vessels are more powerful than others in towing. Some of our vessels of 60 tons are built very fine and sharp, and they will not tow the weight so steadily as a thick full bottomed vessel will. They are therefore obliged to have an additional weight to check their progress.

18,947. If you go too fast your trawl lifts?—Yes, and the consequence is that we catch nothing.

18,948. Then I gather from what you and Mr. Stibbs have stated, that you prefer being left alone?—Yes, a great deal.

18,949. Have you any other remark to offer in reference to trawl-fishing?—I could say nothing more than what I have heard Mr. Stibbs say, except with regard to Whitesand Bay. I should like to corroborate his evidence in that respect. I think that very great injury is done by trawl-fishing in that bay.

18,950. Did you ever trawl in the Sound?—Never, except on two occasions.

18,951. What is the reason you do not trawl there?—In the first place, it is full of rocks, and they would tear our nets so often that even if we were able to get fish there we should suffer much loss by being detained.

PLYMOUTH.

T. Foster, jun.

22 Dec. 1863.

18,952. In former years was there more trawling in the Sound than there is now ?—I don't know.

18,953. How many drift-net boats do you own ?—Only one.

18,954. What is the size of your drift-net boat ?—About eight tons.

18,955. How many nets does she carry ? — 10 herring nets and 10 pilchard nets.

18,956. What is the length of a fleet of nets here ?—400 fathoms.

18,957. She carries a double set of nets ?—Yes.

18,958. What is the difference between the construction of a drift herring net and a drift pilchard net ?—One has a larger mesh than the other.

18,959. What is the size of the mesh of the herring-net from knot to knot ?—It should be about the size of a two-shilling piece.

18,960. Is the mesh of the pilchard net much smaller ?—Yes, it is what we call a shilling mesh from knot to knot.

18,961. Does anybody inspect your nets here ?—No.

18,962. No one ever comes to examine them ?—No one ever has.

18,963. What is your season here for catching herrings ?—We begin about November.

18,964. And how long do you continue fishing ?—We fish up to January and February. In February, or the beginning of March, we generally go away.

18,965. In what condition do you catch the herrings in November ?—They are full of spawn then.

18,966. Do they remain full fish up to February ?—Yes, but I believe they may catch them full fish to-night and the night after they may find them all shotten. Then a few nights after they will get nothing but full fish again. That has been the case here within the last two months.

18,967. Do you ever catch them full as late as the middle of January ?—Very rarely indeed.

18,968. When do they mostly begin to be shotten ?—I believe they began to be shotten last week for the first time.

18,969. Towards the end of December ?—Yes.

18,970. And is it rare to get a full fish in the beginning of January ?—Yes.

18,971. Do the herrings swim in shoals after they are shotten ?—Yes.

18,972. For any length of time ?—For six weeks, or probably for two months, according to the weather.

18,973. Are they the same sized fish as the others you have caught ?—Yes.

18,974. They are not young fish coming on ?—No.

18,975. They are the old shotten fish ?—Yes.

18,976. And they still keep in shoals ?—Yes.

18,977. Where do they spawn here ?—Between the Whit and Yealm Point is where they catch them spawning.

18,978. You say that you catch full fish sometimes one night, and that they are shotten the next ?—Yes.

18,979. Is that outside the harbour ?—Yes.

18,980. Is it rocky ground ?—Yes.

18,981. Can you trawl over it ?—No.

18,982. Do you ever get any spawn up from the bottom ?—No, none.

18,983. Is the herring that you get in the Sound here the same that you get outside ?—Yes, I think so.

18,984. Is it of the same size ?—Yes, but it becomes narrower in consequence of its being shotten.

18,985. But the fish you get in the Sound is, in your opinion, the same fish ?—Yes ; in my opinion they are all of the same length.

18,986. Are you aware of any place about here where a different kind of herring from the common one is got ?—No, I am not.

18,987. Did you ever drift for herrings in Saltash Bay ?—No.

18,988. Did you ever know anyone who did ?—I have seen them drifting there.

18,989. Do you think it is the same herring that they get ?—I don't know.

18,990. Then with regard to line-fishing ; do you own a long-line boat ?—Yes.

18,991. How many lines does she carry ?—600 or 700 fathoms of line.

18,992. How far apart are the snoods ? — One fathom, or a little more.

18,993. Where do you shoot them ? — Off the Dodman.

18,994. On coarse ground ?—Yes, where there is rocky ground.

18,995. Is that the practice of the line fishermen here generally ?—Yes.

18,996. Then, as a rule, they cannot be interfered with by the trawlers ?—No, they fish for congers.

18,997. And congers are found on rocky ground ?—Yes.

18,998. Are there any codfish caught here ?—Very rarely.

18,999. How long have you practised line-fishing ?—For three years.

19,000. Are there many line fishermen here ?—50 or 60.

19,001. Do you mean line fishermen or line-fishing boats ?—Line-fishing boats.

19,002. How many men will each boat carry ?—Some will carry only two, and others three.

19,003. (*Mr. Lefevre.*) What is the size of each boat ?—From 8 to 10 tons.

19,004. (*Professor Huxley.*) What would be the cost of a boat ?—Do you mean with the lines ?

19,005. Yes ?—About 130*l.* That is, however, without any nets.

19,006. Has the number of line fishermen increased within your experience ?—Greatly.

19,007. How many were there 20 years ago, when you began fishing ?—There were not more than eight or nine boats in Plymouth.

19,008. (*Mr. Lefevre.*) What length of ground do you fish over ?—We fish from the Bolt to the Dodman, on the rocky ground off the coast.

19,009. (*Professor Huxley.*) Do you hear any complaints on the part of the line fishermen as to the falling off in the quantity of fish they catch ?—No. My boat has brought in more this summer than she ever did before. She has brought 7, 8, or 9 cwt. at a time, which is more than she ever brought in before.

19,010. One of the witnesses whom we examined to-day has informed us that the total supply of fish has fallen off as compared with what it was 30 years ago. Is that your opinion ?—No, it is not.

19,011. What is your view of the case ?—I think there is a great deal more. I am able now to load a vessel for Cornwall with pilchards, and one for Portsmouth with hake. Last week I took 130,000 pilchards, and I also took from 200 to 300 dozens of hakes to Portsmouth.

19,012. In your experience of trawling has there been any falling off in the supply of fish within your knowledge ?—No, on the average, I think not.

19,013. Is it the same ?—I think it is about the same.

19,014. Is there any regulation in existence which you consider injurious to the fishing here ?—No.

19,015. Or is there any mode of fishing practised that is injurious ?—None that I am aware of.

19,016. (*Mr. Lefevre.*) You sent the pilchards you caught to Cornwall ?—Yes.

19,017. Was that for exportation ?—Yes, for exportation to the Mediterranean.

19,018. What bait do you use for the long-lines ?—The bait we use is squid.

19,019. Do you find any difficulty in getting bait ?—No.

19,020. Have you ever fished in Whitesand Bay with the trawl ?—Never, except on three occasions.

19,021. Have you often observed trawlers fishing there ?—Sometimes.

19,022. Do you go there in bad weather ?—No, only fine weather, and with the wind from the northward.

19,023. What is the depth of water there, taking a line from the two headlands ; what is the depth of

water in the middle of the bay ?—We can go into about 2 fathoms of water, and into about 10 fathoms.

19,024. Taking a line from the headlands, what is the distance to the centre of the bay ?—Not a mile.

19,025. Have you yourself ever observed that a considerable number of small fish have been caught there ?—Yes, I have.

19,026. Are there any mackerel among them ?—No.

19,027. Or any herrings ?—None.

19,028. What are they mostly ? — Small turbots, small brills, and small soles.

19,029. Do you agree with the previous witness, that a considerable number of young fish are caught by the shrimpers ?—Yes, I have seen them take them up.

19,030. What number of shrimpers are there along that bay ?—I don't know.

19,031. Are there a considerable number ? — I cannot say. I don't know. And with regard to spawn, I have seen more spawn last week in my herring boat when she came in than I have ever seen in all the trawlers I have been on board of in the whole course of my life.

19,032. Do you consider that it would do any damage to the trawlers if all of them were prevented from trawling within the bays on this coast ?—No, I think it would be of great advantage to them.

19,033. Do you think they would catch better fish outside than they do now ?—Yes, I think it would benefit them very much if they were prevented from fishing in Whitesand Bay and Bigbury Bay. They ought to be kept out of these bays.

The witness withdrew.

THOMAS JONES STEVENS called and examined.

T. J. Stevens.

19,034. (*Professor Huxley.*) You are secretary to the Fishery Club here ?—I am secretary to the Trawlers' Association.

19,035. You are therefore well acquainted with trawling here ?—Yes, pretty well.

19,036. How many years have you held that post ?—About 20 years.

19,037. Is it a voluntary association of trawlers ?—Yes, it is a voluntary association.

19,038. Do all the trawlers enter into it ?—No, not all.

19,039. Do the great majority ?—Yes, the majority do.

19,040. Has that always been the case since the association was established ?—Yes.

19,041. Then practically, you represent the trawlers here ?—Yes, practically I do. There are certain restrictions that keep out certain parties, but the large majority belong to the association.

19,042. What is the qualification for becoming a member of the club ?—Belonging to the port of Plymouth, and having served their time out of the port—being fishermen, and men who have served their time out of the port.

19,043. Then supposing a landsman in Plymouth had saved money, and invested it in trawling, he could not become a member of your association ?—No, there is an objection to that.

19,044. So that the whole of your members are practical fishermen ?—Yes, they are practical fishermen without exception.

19,045. What was the number of members that belonged to your club when you first knew it ?—About 40.

19,046. How many are there now ?—There are at least 70.

19,047–8. Do all the vessels which belong to your club fish from this port, or go to other ports and fish from thence ?—They fish from this port.

19,049. The amount of capital invested in the club, I presume, really represents the capital invested here ? Yes, it represents a large portion of it.

19,050. At a rough guess, what was the amount of capital invested in trawling 20 years ago by the members of your club ?—It would be something like 20,000*l.*

19,051. And now what do you estimate it at ?—Double.

19,052. At least double ?—Yes.

19,053. Is that on account of the increased number of vessels, or on account of the increased tonnage ?—It is partly on account of the increased tonnage, and partly on account of the increased number of vessels.

19,054. Has the expense of the nets increased of late easy ?—Yes.

19,055. So that there has been a constant investment of capital from some source or other since your first acquaintance with the club began until the present time ?—There has been.

19,056. Then it may be imagined that the pursuit of trawling as a business has increased here ?—It has paid the fishermen, but not those who are not practically acquainted with fishing. Some parties have speculated in fishing, and have not succeeded.

19,057. Is that owing to the nature of the employment itself, or from persons going into a business which they did not understand ?—I think it arises from both causes.

19,058. Is the yield of fish not as great as it was formerly ?—Sometimes I have heard complaints that the yield of some particular kinds of fish has not been in such great abundance as before.

19,059. Suppose you take an average of years, one year being a bad year and one year being a good year, is it your opinion that on that average of years there has been any particular decrease ?—I don't think there has been any particular decrease. There may have been a decrease in some particular kinds of fish, but not as a whole.

19,060. What is the kind of fish that has fallen off ?—The better class of fish. The megrim, for instance, has been deficient. The large kinds of soles have not been so abundant, and turbots are not caught so frequently.

19,061. On the whole, contrasting the yield of the last five years with that of the first five years in which you were connected with the club, do you think there has been any absolute falling off in these kinds of fish ?—No, I do not think so. Bearing in mind the number of trawlers there are now in excess of the number that were in existence when I first became connected with the club, I do not think that the yield has decreased on the whole.

19,062. Has the yield per boat decreased ?—I do not think it has—not per boat ; but there may have been some vessels, as is always the case, that have been more unfortunate than others.

19,063. There is another element that enters into the trawling trade, namely, the condition of the weather. Do you think that that has much to do with the fishery ?—If the weather is very severe they cannot fish, and if that severity of the weather continues for some time it must necessarily affect the entire year's work.

19,064. On the average, has the weather been favourable for fishing during the last 10 years ?—The weather has been very severe. Indeed there seems to be quite a change of the seasons.

19,065. Do you reckon that as an important element in depreciating the value of trawling property—do you think that that has more to do with it than the decrease in the supply of fish ?—The weather has some little to do with it, but occasionally a want of success prevents persons from engaging in the fishery. Sometimes, in some seasons when the success is not so great as in others, the fishermen will go away to other parts of the country.

19,066. We have been told that it is habitual for the trawlers here to work over a comparatively narrow area of ground, about 30 miles long by about 9

PLYMOUTH.

T. J. Stevens.

22 Dec. 1863.

wide: is that so within your knowledge?—I believe that a piece of ground of that extent is termed the usual fishing ground, and that they generally confine themselves to it; but the area they go over depends on the state of the weather. If the wind is in one position, then they go along as far as they can in one direction, but if it is a contrary wind then of course they go in another direction, so that the area they fish over frequently varies, and may occasionally be enlarged.

19,067. But on the average, will that be a fair statement?—Yes.

19,068. You spoke just now of a certain falling off in different kinds of fish. Has that falling off in any year been so great that you would be justified in speaking of the exhaustion of the fish on that ground, or of anything approaching exhaustion?—I am not speaking practically, but only from hearsay. I have heard the fishermen complain that there has been a decrease in the number of the megrims that they catch, and also in the larger kinds of turbots and soles. I do not consider it an exhaustion, however, because although in some weeks they may not take any, in others the fish will be abundant.

19,069. Is your association an insurance society?—Yes.

19,070. (*Mr. Lefevre.*) And is it a benefit club?—It is established on the same principal as the Brixham Society.

19,071. Is it a benefit club?—No, it is not exactly a benefit club, except that the fishermen are assured from total loss, and they assist each other in the event of an accident arising. There is no doubt a certain benefit arising from belonging to it.

19,072. (*Professor Huxley.*) There is one question that I should like to put to you, but you can answer it or not as you like. It was answered without hesitation at Brixham. I wish to know if the trawling vessels insured in your society are to any extent mortgaged?—You can always acertain that at the Custom-House. I should say myself that there is not one per cent. of the property of the Plymouth trawlers mortgaged. My reason for being able to answer that question so promptly is this; there is a regulation in our club which prohibits a tradesman from becoming a member of the club; hence it is that a vessel partly owned by a fisherman and partly owned by a tradesman is only partly insured by the club, namely, the fisherman's part.

19,073. Therefore you would be cognizant of the fact if a vessel were mortgaged?—Yes; it would be necessary to present papers to us to that effect, because if there was any mortgage which had not been made known to us, and the vessel was lost, the insurance would be vitiated.

19,074. (*Mr. Lefevre.*) Do you know whether any money has been borrowed upon them, not in the form of a mortgage?—That I am not prepared to say.

19,075. (*Professor Huxley.*) You are unable to say whether money has been borrowed upon the trawling vessels that does not appear in the shape of a mortgage?—No; but as a rule I think the property is in the hands of none but fishermen. It may so happen that a man may occasionally be so situated as to be compelled to require the aid of a friend, but as a rule the property belongs to the fishermen themselves.

19,076. Do you think it a common occurrence here for the fishermen by degrees to save money and then become the owners of trawl-boats?—That depends in a great measure upon their intelligence and perseverance.

19,077. Is it of common occurrence here?—Yes, I believe it is.

19,078. I ask this question in order to ascertain whether the yield of fish has been tolerably constant, because it all comes to that in the long run?—There does not appear to have been any very great decline.

19,079. If the fishermen are prosperous and there are no mortgages upon their vessels, the money must have been made up from the fish in some way or other?—Yes.

19,080. Have you any knowledge of the price of fish?—Only as a consumer.

19,081. Do you know whether it is higher than it was formerly?—Yes, I think it is higher.

19,082. Is it much higher?—There is no more difficulty now in obtaining the better class of fish than there was 10 or 12 years ago.

19,083. Are you of opinion then that the fishermen obtain more money for particular kinds of fish than they did formerly?—Yes, I think so.

19,084. To what do you ascribe that?—To the all absorbing influence of London.

19,085. Do the fish go up by rail to the London market?—Yes, almost every description of fish. Owing to the facilities afforded by the railway every kind of fish is now sent to London.

19,086. (*Mr. Lefevre.*) Was not that the case 10 or 12 years ago?—Decidedly not.

19,087. (*Professor Huxley.*) It has only been the case since the railway afforded such facilities?—Yes. First we had one railway, and then we had a competing railway, and the rates have been lowered in consequence. Persons have been induced to come here and purchase the fish in order that it may be sent to London by rail. Only within these last 10 days I have seen what I never saw before—that is, herrings sorted in bulk in a railway truck and sent to London.

19,088. Were the fish sorted in travelling, like the letters in a railway post office?—No, it was done at the railway station. They are sorted as they are brought from the quay, and sorted as they are put into the trucks. A few years ago they would never have dreamt of sending herrings to London.

19,089. For what reason—because they would not have paid?—Yes; besides, 15 or 20 years ago the price of fish in London was fabulous, in consequence of the difficulty of getting it there. But now, owing to the different railways, it is brought from all quarters. There is a much greater demand, and the price is less.

19,090. We have had it stated to us that the absolute quantity of fish brought into this port is less than it was 25 years ago. Is that your opinion?—No, it is not. Considering the number of vessels that have been employed, I believe it is possible that each vessel does not take as much fish in proportion as it did in former years, but I believe the aggregate quantity of fish caught will be much about the same.

19,091. Do you think there has been an increase in total amount?—I do not think there has been much increase, and there has not been much decrease. The fishing, from what I have been given to understand, is about the same; but considering that there are now 80 vessels at work where previously there were only 40 working, it is evident that each one of the 80 does not obtain as much fish as each one of the 40 did previously. At the same time I believe the aggregate quantity taken by the whole number is about the same.

19,092. So that the total amount of fish caught by each vessel must have been diminished nearly one-half?—Yes, I think so.

19,093. Under these circumstances, as the amount of money made by fishing here has not decreased, do you attribute that to the rise in price?—In a great measure I attribute it to that.

19,094. To the rise in price?—Yes, to the advance in the price of fish and the greater facilities we have for sending it away.

19,095. The quantity of fish taken has remained as nearly as possible the same?—I am not prepared to say that exactly. My intercourse has been more of an official than of a practical character. But from what I hear, and from what I gather from the fishermen at our various meetings, I do not think there has been much decrease. There has been, as I said before, some decrease in certain classes of fish, but that decrease has been compensated for by an increase in the rougher sorts.

19,096. One witness stated that each trawl would bring in half a ton of fish at a time. As there are 80

trawls, that would make 40 tons of fish. But suppose we call it 30, will that be about the quantity caught in a day?—I have seen the quay lined at times with trawled fish in hampers, baskets, or maunds; but the catch frequently varies. Sometimes there is only half the quantity. Sometimes it may be double.

19,097. Suppose the vessels 20 years ago, when there were no such means of communicating with London and distant places as there are now, obtained the same quantity, namely, 30 or 40 tons a day, how was it distributed or got rid of?—Principally in the locality. The better kinds of fish were always sent away, they would always realize larger prices in the inland towns, and they would be posted to Exeter, and thence be taken by rail.

19,098. Do you think, in the absence of railways, the means of distribution were sufficient to take from this port 25 or 30 tons of fish a day?—I think so. I think the consumption here was greater than it is now.

19,099. The consumption in the port itself?—Yes.

19,100. To sum up what you have stated to us, your meaning is, that the quantity of fish remaining the same, the distribution has differed?—Yes.

19,101. And the price has differed?—Yes.

19,102. Do the fishermen with whom you are brought into contact seem to desire any modification or alteration of the existing laws, or is there anything that they complain of for which they desire a remedy?—I do not think that they complain of anything; but I have heard them occasionally say that it would be better for their own and for the general interest if there was a sort of prohibition to prevent them from trawling within the bays.

19,103. But is not that much in their own hands. Supposing your trawling club thought fit to prevent them, would they not do so?—They might pass a resolution, but would it be binding?

19,104. But could it not be done by common consent?—No. The association is established for a particular purpose—for insuring against loss—not to regulate the mode of fishing.

19,105. It is not in the nature of a trades' union?—No, it is merely for insurance purposes.

19,106. (*Mr. Lefevre.*) Did you sustain any severe losses last year?—No; last year we were particularly free from loss.

19,107. I thought you said the weather had been bad?—It has been bad, but it was of such a nature as to prevent the vessels from going out to sea.

19,108. The vessels from this port do not go to the east coast?—Very seldom. They have gone there occasionally, but I think the Hull people have generally drawn their resources from Brixham.

19,109. What is the total number of fishermen at Plymouth?—There are somewhere about 80 trawlers, I believe.

19,110. And how many men to each?—Five, including three men and two boys. Besides the trawlers there are a large number of hooking boats, of which I know nothing.

19,111. You can only speak of trawlers?—Yes.

19,112. Is it your opinion that the trawlers on the whole are making money?—I imagine as a rule that the fishery is profitable.

19,113. Have many boats been sold out of the club during the last year or two?—There have been some sold.

19,114. Have more been sold than usual?—Not more than usual. They have been sold because they have been superseded by a better class of vessels, larger and more powerful.

19,115. What is the average tonnage of the vessels now?—About 35 or 40 tons. I am speaking of the registered tonnage, not of builders' tonnage.

19,116. Are there still many vessels of the small class left?—There are some of the old boats still existing.

19,117. How many of them?—I should think about one-fourth. There will be from one-fifth to one-fourth of the old boats. They belong to the owners of vessels who have added to their vessels by a better class of boats, and yet are still working the small ones.

19,118. Of your own knowledge do you know anything of trawling in Whitesand Bay, and the bays generally?—No, except that I am constantly going on to the quay, and I hear complaints at times of the fishing in the bays.

19,119. Have you observed on the quay any large quantity of small fish?—No, the boats here appear to have been particularly free from bringing in small fish.

19,120. Do the boats throw any overboard, or do they bring in all they catch?—I believe they throw none overboard. Occasionally, as the trawl is lifted, there may be some thrown overboard that are not considered fit to be brought into the market, but as a rule there is no considerable quantity thrown overboard.

19,121. Is there a sale in the town for small fish?—No, there is no sale in the town for them.

19,122. (*Professor Huxley.*) Have you any acquaintance with the drift-net fishing?—No, except I am sometimes brought into connexion with them. I have held no correspondence with them.

19,123. Is there any drift-net fishing here carried on by strangers?—I think not, unless there may be some mackerel-fishing in the season.

19,124. That will come under the head of drift-net fishing?—Yes, although the number of herring boats and mackerel boats is comparatively small, there are immense numbers that come here in the season following the shoals of fish. Sometimes the fish strike the the shore at one place and sometimes at another Although there are very few vessels that fish for mackerel out of Plymouth, at times we have 200 or 300 mackerel boats off here.

19,125. (*Mr. Lefevre.*) Are immense quantities of mackerel brought here at times by other boats?—Yes. Our facilities for getting the fish away from here are so great that they are brought up from the westward of us. If the fish strike in eastward of us, between Exeter and here, they are brought back to this port. The boats make this port their head quarters. Although we have a large number of trawls, and some herring, mackerel, and pilchard boats of our own, yet in the season we sometimes have 200 or 300 from Hastings, Yarmouth, and other places fishing off here.

19,126. Have there been more within the last few years than there were previously?—Yes.

19,127. They have increased in numbers?—Yes. The seasons vary very much. Sometimes the fish strike in in November, sometimes not until January. Sometimes they strike in to the eastward of us, and sometimes at the Land's End.

19,128. The returns of fish sent off by rail from here would not altogether give us a notion of the quantity of fish caught by the trawlers and the line fishermen off Plymouth?—They would give you a very good idea, I think.

19,129. But they would also comprise an enormous quantity of herrings and mackerel caught by other boats?—Yes, but being fish of a perishable nature they must be fish that have been caught within a short distance of the port. As this port is very accessible, and easily made at all times, and a very easy port to go out from, these fishing boats make it their place of resort, although they do not really belong to the port of Plymouth. Perhaps in the course of a season we may have as many as 400 sail of boats from Cornwall, Brighton, Hastings, Yarmouth, and other places.

19,130. (*Professor Huxley.*) The returns from the railways would all relate to the fish caught within the fishing district off this port?—Yes, although it might not be fish caught by Plymouth vessels.

The witness withdrew.

PLYMOUTH.

W. Samuels.

22 Dec. 1863.

WILLIAM SAMUELS called and examined.

19,131. (*Professor Huxley.*) Have you been a fish buyer here for many years?—Yes, for 20 years.

19,132. Have you noticed any considerable modification or change in the supply of fish brought to the market here?—No; sometimes there has been plenty, and sometimes it has been scarce, and that has been the case ever since I have been a fish buyer.

19,133. Has the number of fish buyers at Plymouth increased during that time?—Yes, fivefold, if not more than that.

19,134. There are five times as many as there were formerly?—Yes, and ten times as many. They come in here from all parts of the country to buy.

19,135. Do you think the total amount of fish supplied to the market has remained the same, or has it increased during the 20 years you have observed the market?—I think it has increased.

19,136. If there are sufficient fish now to supply five fish buyers where only one was supplied before, that, I take it, must be a sign of increase?—Yes.

19,137. Do you think the increase has been very important?—Yes, it must have been so, seeing that it was only enough 20 years ago to support five, and now it is enough to support ten times as many.

19,138. Have you been in the habit of buying all sorts of fish?—Yes.

19,139. Trawled fish and hooked fish?—Yes, both trawled and hooked fish.

19,140. Do you prefer one kind to the other?—No, I take whatever I can get the most out of.

19,141. Do your customers prefer trawled fish to hooked fish?—I have different customers, and some require hooked fish, and some trawled fish.

19,142. That is because they are different kinds of fish?—Yes.

19,143. But if they were the same fish, how would it be then. Suppose you had a fish caught by the trawl and a similar kind of fish caught by the hook, which would they prefer?—I do not think they could tell the difference.

19,144. Can you tell a hooked fish from a trawled fish?—Yes.

19,145. How?—Sometimes they are brighter.

19,146. Do you mean that they have more slime on them?—Yes.

19,147. Will your customers pay more for hooked fish than for trawled fish of the same kind?—No.

19,148 Have you had occasion, when the fish were brought in by the trawlers, to refuse to buy any quantity of them on account of their being damaged?—Sometimes there may be a broken one at the bottom of the maund, but it is very rarely the case.

19,149. Did you ever refuse the whole on that account?—No, never.

19,150. You had never any experience of that kind?—No.

19,151. Surely it is a kind of thing you would have taken notice of if it had occurred?—Yes, but I never had occasion to refuse a whole maund; I have frequently refused one or two fish, but never a whole maund.

19,152. Do you notice any difference in the supply of different kinds of fish; are there, for instance, fewer soles than there were formerly?—I think this year has been the scarcest we have known for a number of years past, but it has been owing principally to the weather. Sometimes it has been blowing a gale of wind, and sometimes there has been a calm, both of which are injurious to the fishing. The weather has been very unsettled during the last 12 months.

19,153. With regard to the price you pay for the fish, do you pay a higher price now than you did 20 years ago, taking one kind of fish with another?—That is according to the quantity caught.

19,154. If a large quantity comes in, you buy cheaper?—Yes.

19,155. Taking the year round, do you pay more this year, 1863, than you paid in the year 1840?—I think we have done so, and I will tell you why; owing to the weather fish have been scarce. Turbots, soles, and brills have made more this year, 1863, than I have ever known, taking the average all the year through.

19,156. How was it in 1862?—We paid nothing like the price we have been paying this year.

19,157. Was the price you paid in 1862 much higher than the price you paid in 1840?—I am sure I cannot tell.

19,158. But if it had been strikingly higher you would have been able to tell?—Yes, perhaps I might. But 1840 is rather before my time. The railway has made the price of fish come up.

19,159. But it is principally the buyers who have got the benefit of that. I am talking of what you pay to the fishermen. I want you to tell us in a general sort of way whether you pay more now than you did in former years?—I tell you as nearly as my memory will allow me, that, taking the whole time I have been a fish buyer, the price of fish this year, 1863, has been higher than I have ever known it to be.

19,160. I daresay you can recollect what was the price you paid in 1861 or 1862. Was that higher than it was 10 years ago?—No.

19,161. Was it pretty much the same?—I do not think the fishermen made much in 1861.

19,162. Shall I be right in saying that from 1851 to 1861 the price of fish ruled pretty much the same?—That is quite right.

19,163. (*Mr. Lefevre.*) Have you kept books which will show the prices you paid?—No.

19,164. Then you could not refer us to them?—No. I buy certain lots of turbots, brills, gurnet, large gurnets, red mullets, soles, and other fish, and what I pay I put down to the parties for whom I buy it.

19,165. You have no books you can refer us to for the last 10 years?—No.

19,166. (*Professor Huxley.*) But still your knowledge upon the subject is sufficient to enable you to tell us that there has not been a rise, for example, of 30 per cent.?—No, I am sure there has not been. But we are governed by the London market; if there is a scarce supply of fish there the price of fish here goes up directly. In such a case, if our fishermen have been able to get out and get a little fish, we buyers that buy for the London market give a good price for it and send it there.

19,167. I want to be able to understand quite clearly from you whether, for example, in 1861 you did not pay 30 per cent. more for your fish here than you did in 1860?—No, I did not.

19,168. You are sure about that?—I am quite certain.

19,169. (*Mr. Lefevre.*) Does a great quantity of fish go from here to London, or do you send much to the inland towns?—A great quantity goes away from here.

19,170. To the inland towns as well as to London?—Yes.

19,171. What towns do you send it to principally? Bristol, Bath, Taunton, Bridgwater, and Weston-super-Mare. In point of fact we send fish to all the towns down the Great Western line.

19,172. Do you send most of your best fish to these towns, or to London?—The best fish go to London, Bath, and Bristol principally. If the small country towns write for a basket of the better kind of fish we manage to send it to them, but not unless they do.

19,173. Do you buy sprats here?—Yes.

19,174. Where are they caught?—Generally up the Tamar, by the Saltash fishermen.

10,175. Is there a considerable quantity caught?—Yesterday and the day before there were great quantities caught, but nothing like the bulk they catch up in Torbay.

19,176. Do they fish for them with a stow net?—They use a seine, I do not know whether it is a tuck-seine, or whether they haul it ashore on the land up the river Tamar.

19,177. Have you observed any quantity of small

fish brought in by the trawlers?—Yes, scores of times.

19,178. Have you bought any yourself?—No, it would not pay to send away small turbots, brills, and soles.

19,179. Where are they caught?—I have been informed that they have been caught in Whitesand Bay. I have frequently asked the question. I have asked, pointing to a lot of fish, if they were Whitesand Bay fish, and have been told that they were.

19,180. What proportion of small fish have you observed?—I have seen at different times hundreds of little turbots, brills, and soles.

19,181. Are they caught at the same time as the larger fish, or is the whole take sometimes small fish?—You do not often see a turbot of 10 lbs. or 12 lbs. among them, not once out of a dozen times, but you may occasionally.

19,182. Do you think it would be injurious to the trade if fishing were prohibited within the headlands?—I think if the fishermen kept out of the bays it would be of advantage to them. Indeed, I have heard the fishermen say so themselves; but they say that if one goes in then of course another must.

PLYMOUTH.

W. Samuels.

22 Dec. 1863.

19,183. Do you think that if they did not go into the bays they would catch more fish outside?—Turbots have been very plentiful during the last year, and the fishermen have not been in the bays as often as they have been before.

19,184. What is the reason of that?—I do not know whether they have been prohibited by the Coastguard or not; that I cannot tell. There was a little rumpus a few years back about their going into the bays, but whether the Coastguard are now keeping them out or not I cannot tell.

The witness withdrew.

James Stibbs called and examined.

J. Stibbs.

19,185. (*Professor Huxley.*) Are you a fish buyer here?—Yes.

19,186. And brother of the witness whom we have already examined today, I presume?—Yes.

19,187. How many years have you been a fish buyer here?—I have been a fisherman and fish buyer for 30 years.

19,188. Have you yourself been a fisherman?—Yes, I served my time to fishing.

19,189. What kind of fishing?—Trawl-fishing.

19,190. Have you any clear recollection of the price of fish when you began to be a fish buyer—how many years is it since you began to be a fish buyer?—About 20 years. I am not a fish buyer ashore; I buy them to run into Portsmouth and other places.

19,191. Have you been cognizant of the prices which fish have realized?—Yes.

19,192. Do you think the fishermen get more per ton than they did formerly?—They get more per dozen for the common fish than they used to do. With regard to the hake, for instance, I have sold hundreds of dozens at Portsmouth for 2*s.* or 3*s.* a dozen, and now I can get double that.

19,193. Do the best fish make that?—About the same price.

19,194. Such as soles?—Yes, soles, turbot, and brill.

19,195. Taking one kind of fish with another, what do you think would be the increase of price per cent. to the fishermen now compared with what it was 20 years ago; is there an increase of 20 per cent. to the fishermen?—No, I think not.

19,196. Is there an increase of 10 per cent.?—I think there is an increase of more than that.

19,197. What is your estimate of the absolute quantity of fish brought into the port, I mean the quantity of all kinds?—Last Friday, of herrings alone 200 tons went away by railway.

19,198. But give us an average catch. What would be a fair estimate of the catch of a trawler per day?—Half a ton, or 15 cwt.

19,199. Twenty years ago, did they catch more or less in a day's fishing?—I think it was about the same then as now.

19,200. Then as there are 40 or 50 more vessels, they must catch more now?—Yes, I think there is double the quantity of fish landed now compared with what there was at that time.

19,201. Have you heard the evidence given before us to day?—No, I only heard part of it; I heard what my brother said.

19,202. Do you agree with him—has your experience been the same?—Yes.

The witness withdrew.

Captain William Hawker, R.N., called and examined.

Capt. W. Hawker, R.N.

19,203. (*Professor Huxley.*) Have you been a fisherman, Captain Hawker?—Only in a small way; I am a naval officer.

19,204. Are you now harbour-master of this port?—Yes.

19,205. How long have you been harbour master?—24 years.

19,206. Have you known the port for a long time?—I have been settled here since 1814; I married and settled here.

19,207. Apart from your official duties, have you paid any attention to the fisheries here?—I have had to pay attention to them. I was charged with a copy of the Convention, and I had to look after these matters. I was allowed a trawl with my own vessel.

19,208. Is that the Convention of 1843, about 20 years ago?—Yes.

19,209 Were you desired by the Government to see that the conditions of that Convention were enforced? No; a copy of it was forwarded to me only. I have been supplied with all the Acts of Parliament connected with my profession.

19,210. In your capacity of harbour-master?—Yes, I have had instructions to keep things right.

19,211. Were you expected to exercise any control over the fishermen?—Not particularly so.

19,212. Were you to inspect them, in order to see that they complied with the provisions of the Convention?—No.

19,213. Is there anybody whose duty it is to examine them?—I don't think there is.

19,214. Have the fishermen, within your own knowledge, ever paid attention to the Convention?—Not at all; all they have paid attention to is their own general interests.

19,215. And there has been nobody to look after them to see whether they do pay attention to it or not?—No, nor has the French Government sent any vessel. An immense number of vessels come here, and instead of catching fish they have bought them and taken them away.

19,216. Do the French fishermen ever come fishing here?—Not within three miles of the coast; our Revenue cruisers would prevent that.

19,217. Have you ever heard of their interfering with our fishermen. I have heard that they have done so off Jersey, and also off the north coast.

19,218. But not here?—No.

19,219. What did they come to fish for; were they trawl-boats?—They had nets and lines, but they found it more profitable to purchase our fish at a low price than to wear their own nets.

19,220. (*Mr. Lefevre.*) Was that before or after the Convention?—Principally before.

PLYMOUTH.

Capt. W. Hawker, R.N.

22 Dec. 1863.

19,221. Since the Convention has been published they have not come?—Not much.

19,222. (*Professor Huxley.*) As harbour-master you will be acquainted with the number of vessels that come to this port?—I was a master in the navy off this station in 1810, and I ought to know.

19,223. Have you heard the statements which have been made here today?—Yes.

19,224. Do you agree with the witnesses that there has been an increase in the number of trawlers?—Yes, and they might have added that the tonnage of the vessels has almost doubled.

19,225. Has there been any increase in the number of drift-net fishermen?—The number of drift-net fishermen and hookers has increased in proportion, and the proportion has almost doubled since I first knew Plymouth.

19,226. The fisherman have increased in proportion?—Yes.

19,227. Have you known much of the masters or owners of these vessels in your capacity of harbour master?—I have been necessarily brought into contact with them, having been harbour master for so long a period.

19,228. Is it within your knowledge that the fishermen frequently rise to be owners themselves?—Yes, I agree with Mr. Stibbs that a steady man may rise and become the owner of a trawl-vessel.

19,229. Are you of opinion that if a trawler works steadily, that it is quite competent for a steady hard working man to raise himself from the position of a sailor on board and to become a proprietor?—Yes.

19,230. The occupation is sufficiently remunerative to enable him to do that?—Yes. If it were not so there would not be so many vessels.

19,231. We have been told in other places that trawling has been a bad speculation, and that people have been losing money by it for years?—I have no doubt they will have told you that at Dundee but that is not the place from which you ought to draw a conclusion. This is a harbour of refuge where they can obtain shelter at any time under our lee. I have paid attention to the fisheries all round the British Isles. I have even been to the Hebrides, and I know something of the fishing.

19,232. Have you noticed the supply of fish brought in by the trawlers?—Yes.

19,233. Do you think the supply of fish per vessel has increased or diminished?—It has increased amazingly. It must be so. I will give you my reason for saying that. In former times the trawlers were small vessels, and it took a whole day to get out on the trawling ground. Some of them could not get out at all at times. Now they have such beautiful fast sailing vessels that they get out in half the time. They have also much larger trawls, and I imagine that the quantity of fish they take must be in proportion to the size of the rake they use.

19,234. Have you paid any attention to the price of fish?—Yes. I gave a lecture in this place about 12 years ago upon the subject. "Short Notes on Fishing" I called it.

19,235. Are you of opinion that the price of fish to the fisherman has increased, diminished, or remained stationary; is the price 5 per cent. more now than it was formerly, or is it less?—It is double as much.

19,236. You think that the price obtained by the fisherman is double?—Yes. I have frequently known a hake sold in the market place for 1*s.* 6*d.* Forty years ago I could have bought hakes for 4*d.* and 6*d.* Now I have to pay 1*s.* and upwards for them. I pay that now for my own consumption.

19,237. Has it been the same in proportion with respect to other fish?—Yes.

19,238. (*Mr. Lefevre.*) Fish of a better quality?—Do you mean such as turbot?

19,239. Yes?—I don't know. It varies. These fish are generally sent away, or purchased for dinner parties at the large hotels.

19,240. Then your opinion is the reverse of that of the last witness, who gave us to understand that at the outside the rise of price to the fishermen was 10 per cent.?—Perhaps if you had asked the fishermen what 10 per cent. meant they would not have been able to have told you. Sometimes the market is glutted, and at others you cannot get any fish at all.

19,241. Then you think there is a larger quantity of fish, and that the price is higher also?—Yes.

19,242. Then, under the circumstances, the trawlers ought to do pretty well?—Everything else is dearer. I think I can venture to say that some of these vessels will cost from 700*l.* to 800*l.*, where formerly they cost 250*l.*, or 300*l.*, or 400*l.* They were very inferior vessels indeed.

19,243. Do you think there has been any failure in the fishing grounds off Plymouth, or any sign of their being worked out?—There is no chance of their being worked out. There are plenty of fish in the deep waters. The French go away to fish out of sight of land altogether. They put in here sometimes, and I occasionally converse with them. They carry salt with them, and they salt their fish in the hold. They go away far to the westward of the British Isles, and do not return till they have a full cargo.

19,244. The fishermen here say they have been trawling here year after year. I want to know whether the grounds have shown any signs of exhaustion?—No, they have not. The fishermen generally fish over the same ground, to avoid tearing their nets to pieces by getting on rougher ground.

19,245. The ground shows no sign of exhaustion?—I think not, and they are constantly going over it with their trawls. If a man falls overboard and is drowned, he is sure to be picked up in the trawls.

19,246. Did you ever know a case of that kind yourself?—I am aware that it has been done. I knew a pilot who fell overboard, and was brought up again in that way. I think if you were to lose your watch overboard it would be picked up if the meshes were small enough to allow it to remain in.

19,247. With respect to the hook-fishing, has that fallen off?—I think not. On the contrary, I believe that it has increased.

19,248. Has the drift net fishing fallen off?—The pilchard-fishing has. I should like to say a word about that.

19,249. We shall be very glad to hear you.—I was for a long time at sea, and was master of a man-of-war. I was master of a man-of-war for two years before the breakwater here was thought of, and there was a pilchard fishery in the Sound in those days. Great quantities of fish were caught there, and I believe that pilchards have been caught in the Catwater. I was a member of the Natural History Society, and a member of the British Association here, and I was on one of the committee appointed to make inquiries of that kind. My attention was, therefore, drawn to the subject, and as regards Plymouth Sound, I ascertained that it was a well-known fact that pilchards were formerly caught in Plymouth Sound in large quantities; now there is not one to be seen. There must be some cause for that.

19,250. What is the cause?—I know what it is perfectly well.

19,251. What is it?—It is owing to the breakwater. The bottom of the Sound was sand and gravel. The pilchard is a fish that frequents a sandy bottom. When the breakwater was raised above the level of the sea smooth water was produced, and there were no gales of wind to affect it. The consequence was that solid matters held in suspension by the action of the waves were brought in in a turbid state and deposited. We have now two or three feet of solid mud where it used to be all sand and gravel.

19,252. It is filling up, I suppose?—It is. There is no mistake about that. You will find that there is a total change. All along the coast you find that herrings go into the muddy creeks and deposit their spawn. I apprehend that the breakwater is a great place for herrings now. I lived out at the end of the breakwater for 10 or 12 years, and I had a fishing net which I have set for herrings, and we have caught

great quantities. I have also found the net occasionally covered with that kind of slimy matter which Mr. Stibbs mentioned. Now that slimy matter is the spawn of herrings. I examined it microscopically.

19,253. (*Professor Huxley.*) What time of the year was that?—The end of the year.

19,254. What depth of water have you inside the breakwater where they deposit the spawn?—About 30 feet at low water; from 30 to 36 feet in the deepest part. The place I speak of is close in the sheltered part of the Sound, out of the tide; I believe that they go into Yealm Creek and Fowey to spawn, in the same way.

19,255. Do you think the building of the breakwater has been the cause of the pilchards keeping out of the Sound?—They do not frequent a muddy ground at all.

19,256. (*Mr. Lefevre.*) Is it not the fact that they have also abandoned Whitesand Bay?—No; Whitesand Bay is a sandy bay. The pilchards have not frequented this coast so much as they did in former years, although there have been great quantities caught this year; at least I have read so in the newspapers. The young herrings bring the mackerel in here. They come into Plymouth Sound in great quantities, and into all the harbours here after the young brill.

19,257. (*Professor Huxley.*) Is there any considerable mackerel-fishing here?—The most considerable mackerel-fishing is in the offing.

19,258. Are they caught with nets?—Yes, and the French catch them with lines too.

19,259. Is there a considerable fishing for commercial purposes?—The Plymouth people do not catch many, but the Yarmouth and Shoreham fishermen come here. I have seen 150 vessels going out of this harbour on a Monday morning, and at least 100 of them would be strangers.

19,260. Then there is an abundance of mackerel off this coast?—Sometimes; not always.

19,261. Is there generally?—Yes.

19,262. (*Mr. Lefevre.*) Are they line fishermen you are speaking of?—No, net fishermen.

19,263. (*Professor Huxley.*) Have you paid attention to the natural history of the fish here?—Yes.

19,264. Do you know of any except one kind of herring here?—There is one kind they call scad, I believe.

19,265. That is a horse-mackerel?—No, a scad, a herring.

19,266. Is it larger than the common herring?—I think it is. It is very thin.

19,267. Do you know of any smaller herring?—No.

19,268. (*Mr. Lefevre.*) Do you agree with Mr. Stibbs as to the quantity of small fish caught in these bays?—Yes. I believe that the young fish in every part of the world take shelter in-shore, in smooth water if they can.

12,269. Does the catching of these small fish affect the catch generally?—I think it does necessarily. They would become large fish if they were not caught when young.

19,270. But you have not observed any falling off in the catch of large fish?—No; but if we were to preserve the small fish in our seas as we do in our rivers, I believe there would be a greater number of large ones caught.

19,271. Do not the large fish in the sea eat a great number of the small ones?—Yes, no doubt. I have seen eight pilchards taken out of a large hake. My coxswain opened his waistcoat for him, and there they were.

19,272. Do you think that a large number of these small fish would ever live to be caught in the trawl-nets?—These small fish when they are caught are destroyed. They are killed or thrown away. If they are caught in a trawl there is no chance for them, because the trawl catches along with them small stones and large shells, cockle-shells, and so forth.

19,273. If any regulation were established to prevent trawling within the headlands, would there be any means of carrying that out, or would the law become a dead letter?—To do any good you must enforce it.

19,274. But could it be enforced here?—Certainly, if proper persons were authorized to do it, with the assistance of the Coastguard men.

19,275. Would it necessitate the employment of cruizers?—The coast is guarded by men with boats at present, and if they had instructions they would carry them out.

19,276. (*Professor Huxley.*) Do you think the Coastguard could manage that?—Yes.

19,277. (*Mr. Lefevre.*) Do you think they would if such a regulation were established?—Yes, and I am fully of opinion that the spawning grounds ought not to be disturbed.

19,278. Do you think that the fish spawn in-shore?—I have no doubt of it. The herrings come here in spawn in immense numbers from the north. They enter all our creeks and bays, and there they spawn. I think they ought not to be disturbed. At the same time there may be some erroneous views with regard to the bays. For instance, in Whitesand Bay and Bigbury Bay there is not so much spawning as you may imagine, because these bays are pretty shallow towards the land. Wherever the sea breaks, you may depend upon it that no fish will spawn, because a breaking sea disturbs the bottom. I believe the bottom is disturbed even at the depth of 14 fathoms. I know of one instance in which a disturbance took place 14 fathoms deep. That was to the westward of the Lizard. I was sent down there to inquire into the loss of a vessel. I believe the captain had gone to sleep and that the vessel drove to the westward, and washed about so much that she went down. The wreck interfered very much with the fishing, and the west country people petitioned the Lord High Admiral to have her raised on account of her being in the way of the fishing. As the matter was one of immense importance to Cornwall I was sent down to make inquiries. I found that the vessel had sunk in 14 fathoms of water. I ascertained from the Coastguard man that the place where she had sunk was a place called Gunwalla Cove. I knew that we could not send our vessels down to a vessel of that kind to raise her, because if we had attempted to raise her we should only have lost our own boats and craft. I communicated with some crab-pot men to ascertain her position. They told me that the vessel had broken up. She was loaded with slate from a quarry in North Cornwall. I asked them how they knew she had broken up. They told me that they had shot their crab-pots and had brought up portions of the slate that had come out of her. From that I know that even at that depth the bottom of the sea is positively set in motion.

19,279. You know a great deal of the coast of the south of England?—Yes.

19,280. Are there a considerable number of bays where the trawlers catch great numbers of large fish, such as Rye Bay?—They catch great quantities of whiting there.

19,281. Then would not a general regulation forbidding trawling within the headlands be injurious?—Certainly it might be in some places.

19,282. Is it within your knowledge that large quantities of small fish are brought into the harbour by the trawlers?—Yes, small gurnets and little bottom fish that are caught by the trawlers. All that are worth selling at all are brought in; many are given to the boys. The squid is given to the boys, and it is only the very poor people who buy them.

19,283. Are they caught in the bays?—No, in the deep water outside. Great numbers of them are raked up. I have been trawling there myself, and have seen what has been brought up in the trawl. All kinds of things are brought up—shell-fish, young fish of every description, many of them torn to pieces. The trawls rake up everything—small stones, broken shells, oyster shells, and everything.

LYMOUTH.

Capt. W. Hawker, R.N.

22 Dec. 1863.

19,284. Notwithstanding that they take the small fish, you have not observed any decrease in the take of the larger fish?—No; on the contrary, there is a greater quantity of large fish taken. I should think there are four or five times as many caught now as were caught 40 years ago, because the means of catching them are so much increased.

19,285. Does each vessel bring in more than it did 20 years ago?—The large trawlers will catch twice as much; they go out in half the time and come in in half the time, and they consequently have their trawls down double the time. All other things being equal, they must necessarily catch twice the quantity.

19,826. Do you think that every trawler catches double the quantity now?—That depends upon what kind of trawler it is. No man would put his foot now into some of the old ones.

19,287. Is it only the improved trawler that catches more fish?—Yes; they cost a great deal more money now.

19,288. (*Professor Huxley.*) Do you think the amount earned by the trawlers has been made by the increased price of the fish, or by the increased quantity of fish they have caught?—By both. I think it is rather a better living than it was. When I was assistant master lieutenant in Devonport Dockyard, I was told that many of the people were obliged to apply for parochial relief in the winter time. They are rather better off and more respectable now altogether.

19,289. Are the young fish now caught in the bays the young of the fish caught by the trawlers?—They are young fish.

19,290. They are not the young of the herrings, and mackerel, and other fish?—Yes.

19,291. And the young also of turbots, plaice, dabs, and so forth?—Yes; they keep coming along the shore. I have seen the Cove of Cork full of them.

19,292. Are most of the French boats that come here trawlers or line fishermen?—The French boats are pretty well supplied with gear; they have long-lines, and lines for mackerel as well. They fish differently from our fishermen. They tie a set of long-lines together and have snoods.

The witness withdrew.

M. Dunn.

MATTHEW DUNN called and examined.

19,293. (*Professor Huxley.*) Are you a fisherman from this port?—From Mevagissey, in the port of Fowey.

19,294. You are a Cornish man, then?—Yes.

19,295. How long have you been a fisherman at Mevagissey?—Since I was nine years of age.

19,296. How long is that?—I am 33 now.

19,297. What kind of fisherman are you?—A general fisherman. I have been trawling, I have been drift-net pilcharding, I have been drift-net mackereling, and I have been hooking. I have never been trawling since I was 12 years of age, but I have noticed when I have been trawling in-shore in the spring months of the year that the trawl has been covered at times with a slimy substance that hung down like globules. My father told me it was spawn, and he told me that I was not to go and fish in the bays at that time of the year, as he was conscious that it was injurious to the larger fish; he told me that it was spawn which the larger fish had deposited there, and he said that if ever he went trawling when it was about it was only because he was obliged to go from necessity. He said it was decidedly wrong to do so, and he was sorry to see either himself or any other fishermen doing it. When I say that I went trawling in-shore, I mean that I was in Mevagissey Bay in-shore. There was smooth ground there on which we could use our trawls.

19,298. Then you think that trawling in the bays is injurious?—Yes, it injures the spawn of the fish.

19,299. Is there anything else you wish to tell us in addition?—There was a remark made by a gentleman here that trawling did not lessen the size or the quantity of the fish taken. Now we had a trawler in our family, and we kept an account. The book is at home now. It states that the fish dropped off to that extent that we were obliged to give up trawling in the bay.

19,300. In Mevagissey Bay?—Yes. We had four trawlers, and now we have only one. We almost destroyed all the soles.

19,301. Did you catch other fish in considerable numbers?—Yes, we caught plaice, and a fish we called "marysole," and lampreys.

19,302. Do you not think that it was unwise thus to cut off your supply of fish?—Yes.

19,303. What is the condition of the fishery now in Mevagissey Bay; is there enough to afford sport to the trawlers?—There is only one trawler there now.

19,304. (*Mr. Lefevre.*) What was the size of the boats you have been speaking of?—They were from 28 to 35 feet long.

19,305. Were they open boats?—Yes.

19,306. What was the size of the mesh?—I cannot say.

19,307. Was it smaller than the legal size?—The Coastguard men were there to see if there was anything wrong; it was their place to rectify it. We had our first trawl made by a Plymouth man.

19,308. What was the length of the beam?—It was 25 or 26 feet long.

19,309. Was it large enough to go out here?—I used to go out on the same ground. The same sized boat went to Whitby and Scarborough last year.

19,310. You have given up fishing in this bay?—Yes.

19,311. Do you now use the boats for trawling?—No, we don't use the trawl at all now. I have the irons at home.

19,312. What do you fish for now?—I am here in the herring-fishing now.

19,313. You have not been engaged in trawling since you were 12 or 14 years old?—No.

19,314. Was this trawling you speak of carried on in the bay when you were 12 years old?—Yes.

19,315. When was it given up?—In 1848.

19,316. (*Professor Huxley.*) Are you of opinion that trawling in the deep sea does any harm?—I have no experience on that subject.

19,317. Is there anything else upon which you wish to make a remark to us?—No.

The witness withdrew.

J. Easton.

JOHN EASTON called and examined.

19,318. (*Professor Huxley.*) Are you a drift-net fisherman?—Yes, I am at present, but I served my time to trawling.

19,319. Have you been long a drift-net fisherman?—For seven or eight years.

19,320. You are well acquainted with the drift-net fishing then?—Yes; I have been mackereling, herring-ing, pilcharding, hooking, and trawling.

19,321. Is there a great deal of mackerel-fishing here?—Sometimes they are caught in the seines and in the drift nets.

19,322. Do you use the same kind of mesh that you use in the herring-fishing, or a larger mesh?—A larger mesh.

19,323. What is the size of the mesh?—27 or 28 to the yard.

19,324. The working of the net is the same as a herring net?—Yes; the out-sea fishers use the same.

19,325. Are there many persons engaged in the mackerel fishery here?—They are mostly strangers.

19,326. Are there not many boats belonging to Plymouth?—No; there are a few from Mevagissey, and a few from Brighton.

19,327. What is the size of the boats?—They are open boats, half-decked boats. There were some decked boats, but they have dropped off.

19,328. How many people are engaged in the fishery here?—We have turned our pilchard boats into herring boats of late years.

19,329. How many of them are there?—About 40.

19,330. Forty herring boats?—Yes.

19,331. What is the crew of each boat?—Four men.

19,332. Are there any boys?—No.

19,333. What is your fleet of nets for each boat?—We have eight nets of 45 fathoms on the average.

19,334. What is the size of the mesh from knot to knot?—There are 34 to the yard.

19,335. Does anybody ever examine the mesh of your net to see that it is according to the law?—No. We are only young fishermen here. We only took it up last year.

19,336. Nobody does examine your nets?—No.

19,337. Have you had net herring-fishing here at Plymouth for a number of years?—It has not been followed up.

19,338. What time of the year do you find herrings in abundance here?—About this time.

19,339. Do you ever find them earlier than this?—Very seldom, and they only last for a short time.

19,340. How long do they last?—About five or six weeks.

19,341. Do they go into January and February?—They mostly shoot their spawn then, and we sometimes get one or two shotten fish.

19,342. In what condition are they now?—They are full fish, but we have a few shotten.

19,343. Then the fish are spawning now?—Yes; we have caught shotten fish one night, and the next they have been full of spawn.

19,344. If you catch them at the end of January, do you get them full fish or shotten?—Mostly shotten.

19,345. Do the fish go in large shoals after they are shotten?—Yes, very large.

19,346. (*Mr. Lefevre.*) Is it only during the last year that you have gone after herrings?—No, for the last two or three years.

19,347. Did not the herrings come off this coast before?—I don't know. We are quite novices here. We never tried before. We knew they were in the bay. Some of the Mount's Bay men followed them, and we have gone after them now. But they have become more numerous of late years. Some years they come, and some they do not. Like the pilchards, they are plentiful at one season and very scarce at another.

19,348. (*Professor Huxley.*) Did you ever know sprats to be found in this harbour?—There have been great quantities in this harbour, but they are not as plentiful as they are further off.

19,349. How do you catch them?—In seines. We draw the seines up the harbour.

19,350. Are they true sprats?—I cannot say. I never caught them myself.

19,351. Are there any number of men engaged in sprat-fishing?—Seven or eight.

19,352. When are they engaged?—About now. I never saw them drag their nets. They are generally engaged about Saltash. We don't see them here.

19,353. Is the sprat trade here any considerable trade?—They do not last very long, I believe.

19,354. Do the mackerel boats from the eastward bring their fish here?—Yes, when they fish here.

19,355. There are only two or three mackerel boats at Plymouth?—Yes.

19,356. Have the mackerel boats from the eastward always come down here for many years past?—Yes, I was fishing in them myself 20 years ago. They used to take pilots when they first came to pilot them about the harbour, and I have been sailing with them in that capacity.

19,357. Have you been a pilchard fisherman?—Yes.

19,358. Have you known the pilchards taken in the harbour here?—No, they have been taken here in my father's day, but not since the breakwater was built.

19,359. You agree with Captain Hawker on this point?—Yes.

19,360. Do you find from your own knowledge of the hooking fishery that there has been any falling off in the quantity of fish taken?—No, I think the fishermen are more enlightened now, and take more fish, they have also larger trawls. As Captain Hawker says, the craft we used to have were very poor.

The witness withdrew.

THOMAS FOSTER, jun., recalled.

T. Foster, jun.

19,361. (*Professor Huxley.*) You wish to make some addition to your evidence?—Yes. The man who was just examined, and who belonged to Mevagissey, said that no marysoles are caught there. Now I can assure you that is not true. In the spring of the year we may go down there and catch two or three parts of a maund in the course of a day.

19,362. (*Mr. Lefevre.*) In a trawl?—Yes.

19,363. (*Professor Huxley.*) In the bay?—No, two or three miles off.

19,364. Then their killing them in the bay has not affected them outside?—Not in the least. We never go into the bay. I do not think any of the fishermen ever shoot their nets there.

19,365. Do you find that the fish outside the bay have decreased?—No.

19,366. Is there anything else you wish to remark upon?—No, except with regard to the sprats. You were asking just now about the sprats. They are much larger than the sprats caught off Spithead. I have had opportunities of seeing both, and I know that they are considerably larger.

19,367. Are they real sprats, or something else?—I think they are real sprats. But the sprats caught off Spithead are very small.

19,368. Do you know a sprat when you see it?—I think I do.

19,369. Do you know a sprat from a young herring?—Yes.

19,370. And you know that these are larger sprats than those to the eastward?—Yes; to-morrow morning they will be brought here, and then you can see for yourself.

The witness withdrew.

The inquiry was adjourned until Wednesday, the 23rd of December, at Exeter.

Exeter, Devonshire, Wednesday, 23rd December 1863.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

EXETER.

JOHN EYRE KINGDON called and examined.

J. E. Kingdon.

23 Dec. 1863.

19,371. (*Professor Huxley.*) What is your occupation here, Mr. Kingdon?—I have no occupation at present. I am only an idle fellow. I am a captain of volunteers, however.

19,372. I believe you take a great interest in the fisheries here?—Yes, and I always have done all my life.

19,373. Have you been acquainted with the fisheries here for many years?—Yes, for 55 years.

19,374. I believe you wish to lay some statement before us?—I presume that you wish to take evidence as to the state of the fishing from the mouth of the river and outside the river to where it flows?

19,375. Quite so?—Then I may as well commence with a description of the river. The tide comes into our river at Exmouth and flows about 10 miles as far as Salmon Pool to within about one mile of the city of Exeter. At Lympstone at high tide the whole river is about $1\frac{1}{4}$ miles wide. When it comes to low tide the channel is narrowed to about 20 or 30 yards. The bottom is composed of fine sand, and in various places there are large banks of mud with narrow streams of water, forming gullies, running through them. I am of opinion that the fish go to those streams for the purpose of spawning, and that is the general impression here. Those places have been found out by the fishermen, and there the fish are taken up in large quantities. They are caught in many cases by hand in small nets, and since it has been the custom to take them the quantity of fish has materially decreased. I propose, before I proceed further, to state to you the different kinds of fish that are caught here, and to divide them into three classes, namely, fish for the poor, fish for the rich, and shell-fish. I will then take the fish caught outside the bay and inside the bay. Among the fish for the poor I enumerate mackerel, grey mullet, herring, pilchard, basse, gurnard, bream, whiting pouting, small whiting, hake, flounders, dab, plaice, conger, skate, sprat, ray, and sand launce. The fish for the rich are turbot, brill, soles, john dory, whitebait, whiting, surmullet, cod, pollack, haddock, sea lamprey, sea trout, and sturgeon. They are all fish that frequent our river. I have left out the salmon, because there is a special Act of Parliament in reference to the salmon fisheries.

19,376. Is the river lamprey found here?—No, not the river lamprey, but we get the sea lamprey. Perhaps we may catch 100 in a year of the sea lamprey at Salmon Pool. There is a weir there where they come to spawn.

19,377. Where does the fresh water begin?—It begins at that weir—at Salmon Pool weir. It is met there by the tide, and the tide rises three, four, and five, and even nine and ten feet high, so that we have our river varying from one foot in depth to nine and ten feet. Not long ago we caught a sturgeon seven feet six inches long, and a fine specimen it was. With regard to the number of fishermen, in order to explain the state of the fishing, I think I had better begin at the mouth of the river at Exmouth. There they have six trawlers.

19,378. Are they large boats?—No, the average tonnage of each will be from four to five tons.

19,379. What is the length of the beam?—The beam of three of them is 25 feet long, and of the other three it is only 12 feet long. They have, in addition, about 30 small boats which they employ in drifting for herrings. There are no seine fishermen. They are not entirely dependent upon fishing for a livelihood, but they act as lumpers and pilots as well. I come now to Lympstone, which is about midway up the river. At Lympstone seven seines are used for river fishing, and they go out every day for the purpose of catching small fish, which I will explain more particularly in a few moments. I think I forgot to say that in addition to the fish for the rich and the fish for the poor which I enumerated just now, we also get several descriptions of shell-fish—namely, crabs, lobsters, prawns, cockles, shrimps, mussels, scollops, periwinkles, and oysters. The fishermen at Lympstone get mussels, cockles, and winkles. They also get oysters. I go on next to Topsham. I cannot tell how many fishermen in number there are at Topsham, but there are persons here from Topsham who will give you that information. All the men there are employed in a great measure in using the seines all over the river at low water, and you will perceive, in consequence of the narrow channel at low water, how easy it must be to rake the whole of that channel with the seine and take up all the fish. I am sorry to say that the fish they take out now are of so small a character as to be scarcely worth bringing into the city for sale.

19.380. Are there no fishermen at Starcross or at Powderham?—Mr. Drew, the steward of the Earl of Devon, is here, and he will give you all the information you require in reference to the state of the fishing there. The fishermen of Topsham go out to fish at low tide, and they use seines with a very small mesh indeed. The fishermen at Lympstone do the same, and when I tell you that they take small fish and when I show you the centre of the bunt of the nets they use, you may readily fancy that it is impossible for anything to go through that mesh that would be worth having.

19,381. What is the size of the mesh from knot to knot?—From knot to knot on the square, not lengthwise?

19,382. No, on the square?—It is half an inch from knot to knot.

19,383. Is that the size of the bunt?—Yes, and I believe that some are smaller than that.

19,384. What is the size of the wing of the net?—About one inch. It is what is called a shilling mesh. If you take a shilling and measure it you will find that although it is called a shilling mesh it is as near as possible an inch square. That is commonly called the herring seine. The fishermen here drag with those nets right through the whole of the river from one end to the other at low tide, and it is of no odds to them whether the stream is running fast or slow, for we have freshets in our river. If it is running fast all they do is to put on heavier leads. I have been many times out with my boat when I have been obliged to take up the anchor and let the seines pass by, when I was not able to see a single cork floating on the water.

19,385. How is a seine constructed; what is the length of it?—My seine at Salmon Pool is 45 fathoms long.

19,386. What is the depth?—30 feet.

19,387. Is there a pocket in the bunt?—No, I do not think they have a pocket.

19,388. Is it loaded at the bottom with lead?—Yes, according to the rate at which the current is running, because we have freshets in our river. At low tide the current will be considerably altered. They have extra leads that they put on, and those leads will sweep everything from the bottom, almost the sand itself. I will show you what it is they catch. There is a fair flounder caught by the hook and line, which I bought yesterday at Lympstone. I have caught thousands of them with the hook and line myself. I have been in the habit of going down the river, and I have caught a great market basket full of them, but within the last three or four years if I catch half-a-dozen when I go down I am quite content. This is what is caught now in the seines, and it is not one half the size it ought to be.

19,389. What is the length of the flounder you

have in your hand?—4½ inches from the head to the stream of the tail.

19,390. Is that the average size of the flounders caught by the nets?—There are many that are a great deal less than that; some are not more than two inches over.

19,391. Are there many much larger?—Some of the larger size are caught as well.

19,392. They are caught in the seines as well?—Yes.

19,393. Can you give us any idea of what is the proportion of large fish caught in the nets as compared with the small?—The small to the large is tremendously out of proportion, and for this reason, I believe the small fish come in from the sea to get upon those beautiful banks we have here, in order to be out of the way of their enemies, and also because where the river joins the tide it makes the water one degree warmer than it would be otherwise. There are beautiful warm places for the fish to lie in in our river, and plenty of food as well. They go backwards and forwards in a great measure with the tide. I have found, when I have been fishing in a dead low tide, that for about a quarter or half an hour I cannot take a single fish. The moment the tide turns the fish run out, and I can catch them again.

19,394. Will you describe the mode in which the seine is worked. I understood you to say that it was 45 fathoms long?—Mine is.

19,395. What is the width of your river at low water?—About 20 or 30 yards.

19,396. Then at low water an average seine net will stretch across the whole of the river?—Yes.

19,387. How is it worked?—We take our stand at a point and send a boat round, after which we take the net in. We draw it down to the point from which the boat started; we draw it right down until we come into close contact. The net is then drawn gradually in, and in the bunt of it everything is taken.

19,388. How long do you allow the seine to stand across the current?—Not long, we take it in as quick as we can. We go as fast as we can for the purpose of catching the fish. We make the haul round, and all that are not good the Topsham fishermen throw out on the bank instead of throwing them into the water again. They will not take the trouble to return them to the water, and the consequence is that the birds come and destroy them. Many of them are fish only the size of half-a-crown, and some of them are even less than that. They take them out of the nets and leave them on the banks, where the birds come and destroy them afterwards. We have various sea birds here, gulls, shags, cormorants, and herons, and they are very destructive to fish, as a matter of course. In addition to small flounders, the fishermen catch little herring and even shrimps in the seines. These (*producing a basket of fish*) I bought on Saturday last. I went down to Lympstone after I had seen Mr. Holdsworth, the Secretary to the Commission, and I bought the fish from the fishermen as they came in. You can imagine what their net must be if they will not let little fish of this sort go through. This (*pointing to the fish in the basket*) is a whiting, this is a gurnard.

19,389. Which are the young herring you referred to?—The fishermen assured me that a great number of the fish in the basket are young herring. There were even a number of shrimps in their nets. This is a whiting, and I am quite sure you will agree with me that it is of no use to anybody. Here is a small gurnard, and we get a great number of what we call small "tom cods," which are very small fish.

19,400. Do you consider the contents of that basket a fair specimen of the fish caught here?—I will give you my word of honour that I went down by chance, that I seized a basket of fish as it was brought in, and bought these out of it. They were brought in for sale. I come now to the fishing outside of the bar. They are celebrated for cockles at Lympstone, and have been ever since I was a boy; I used to call at Lympstone whenever I could to get some of their celebrated cockles. Dozens of boys and women have been employed there in gathering cockles. But what is the case now? By a little bribery yesterday, I got a few big ones taken out; here they are; they are the celebrated Lympstone cockles. At one time nothing would have been considered worth having that was less than that. I have bought some thousands of them. I took the baskets as they came in yesterday, and bought all they had; and here is the description of cockles I got. There is not one larger in the whole basket than that. The large ones I have here I simply brought to show you what Lympstone cockles were a few years ago. But nearly the whole of those fine cockles are gone now, and why is it that they have been destroyed? It is because they have been allowed to be taken at all seasons of the year, no breeding season being left for them; they are all destroyed indiscriminately.

19,401. Do you get any oysters here?—Yes; I am now coming to the oysters. I think you will say that these oysters (*producing a basket of oysters*) are as fair a sample of oysters and as good oysters, except the real natives, as you can obtain. Many of these oysters are very fine. I bought 300 or 400 yesterday. I picked out the first I came to, and I have brought them here in order to show you what our oysters are. These oysters all come from Falmouth; they go down to Falmouth for them, and they have been in the habit of bringing in to Lympstone about 200 tons of those oysters every year. The same practice has been followed at Starcross. There they have also been in the habit of bringing in a great number of the Falmouth oysters and laying them down. The oysters down at Falmouth have a very copperas taste, but they grow very fast, and being brought up to our river they suit the river exactly and do remarkably well. But oysters are much dearer now; I have given 2*s.* a hundred for oysters that three or four years since I could get for 1*s.*

19,402. The oysters you have here are not natives?—No, they are brought here to improve.

19,403. (*Mr. Lefevre.*) Have you no oysters that are natives?—None at all; at least nothing to speak of.

19,404-6. (*Professor Huxley.*) They do not breed here?—No, never. All the oysters we have had here have been brought from Falmouth, and now on inquiring of the fishermen, I am told that they have had none for two years. They say that what they used to give 2*s.* a tub for the Frenchmen now come over and take away, giving 12*s.*, 13*s.*, or 14*s.* a tub for them. The consequence is that, unless there is some alteration, we shall lose all our oysters about Starcross and Lympstone in the course of a year or two at the furthest. They will dispose of all they have now, and not being able to renew the supply, the beds will become exhausted.

19,407. How many oysters does a tub hold?—Two bushels.

19,408. How many oysters are there in two bushels?—About 1,500, if you will take the general run of them. I think I have now told you as far as I can what the river produces with the exception of the fishing in the neighbourhood of Topsham. There are large quantities of winkles obtained there which are sold for 10*s.* 6*d.* a sack, a sack containing eight pecks. They have been selling immense quantities of winkles at that place, but the supply is now decreasing in a most wonderful way, because there have been such quantities of them taken.

19,409. Where do you find the periwinkles chiefly?—All over the river; from Topsham all down. There are thousands and hundreds of thousands and millions of them. When I was a boy, I used to be very fond of gathering winkles. I have frequently been up to my knees in mud gathering them, and now they have decreased to such an extent that they can scarcely get any. The next shell-fish we have is the mussel. We have been in the habit of obtaining very large quantities of mussels from the mouth of our rivers and of putting them down on the

EXETER.

J. E. Kingdon.

23 Dec. 1863.

Lympstone side of the river. There they have increased to a wonderful extent, and we have sent away tons upon tons every month by the South Devon Railway to London. Now, unfortunately for our fishermen, the Hollanders are enabled to send over better and cheaper mussels, and the only use of our mussels now, at present, is to make bait for catching whitings outside the bar. In speaking of the oysters, I ought to say that some of our fishermen have informed me that in Jersey they have a harbour-master, who carries a ring with him, by which he measures the oysters. Every oyster that passes through the ring is required to be replaced on the beds. Now, that seems to me to be a very good plan, and I think it might be adopted here with advantage. I will now bring your attention to the trawlers outside. Here (*producing a basket of fish*) is a specimen of the fish they catch. This a sole.

19,410–11. To what trawlers do you refer?—To those who come from Brixham, and the Exmouth trawlers as well. They both bring in the same quality of fish, and I believe that they use the same mesh as near as can be.

19,412. There are trawlers at Exmouth?—Yes.

19,413. How many trawlers are there there?—Six, I believe.

12,414. What is the tonnage of the vessels they use?—The tonnage of their vessels is about four or five tons.

12,415. What is the length of the beam?—The length of the beam of three of them is 25 feet and the rest carry a beam 12 feet long.

19,416. (*Mr. Lefevre.*) Do they fish mainly outside the bar?—Yes, outside.

19,417. Where is the bar?—Here (*pointing to the map*) at the entrance, right across. A bar of sand goes right across. Where the tide flows the river becomes very narrow, but they trawl backwards and forwards.

19,418. (*Professor Huxley.*) Do they trawl backwards and forwards off your river?—They go out to suit their own purposes. If they get good luck they go out further.

19,419. Do they keep mainly in the offing off the river?—They keep off the river outside altogether. They cannot come inside the bar. There is a very heavy bank of sand there which would prevent them. They cannot come near that, and therefore they are obliged to go out and get into the open sea.

19,420. Do they habitually trawl in the space in the offing off Exmouth?—Yes, that is the place in which the trawlers fish.

19,421. They do not go furthr?—No, there is ae great curve, at one end of which is Brixham and Berry Head. There is Berry Head on one side, and they could go on towards Sidmouth and Portland on the other, but they do not go so far out.

19,422. They keep to a radius of 20 or 30 miles from Exmouth?—Yes, they never go beyond that.

19,423. (*Mr. Lefevre.*) Are there any more of these small trawlers here?—I believe there are only six at Exmouth. That information I obtained from Mr. Hawkins, the head of the Coastguard at Exmouth.

19,424. Are there any at Dawlish?—No, there are none there, I believe.

19,425. Are there any at Teignmouth?—There is only one there, I believe. There are several at Shaldon, which is on the same river, the river Teign. With regard to the size of the fish caught by these trawlers, I may say that I went into the market at Exmouth the other day, and bought a turbot. Here it is. Now I am quite sure that you will agree with me that no such fish as that ought to be taken by a trawler.

19,426. What is the size of that fish?—10 inches is the full length. I went into the market here this morning, and from a person there who had just come from Brixham, I got all these soles. I picked them out of his basket as he came up from Brixham. He gave me the choice of them to take what I pleased. He told me he could not sell such a fish as that at home.

19,427. (*Professor Huxley.*) Then why did he buy them?—He said they had been sent to him as a basket of fish.

19,428. But if a man were supplied with a considerable quantity of fish of that decription, would he deal with the same trawler again?—Yes, I suppose he takes his chance. Of course all the fish he has are not like that. I have brought home a good many fish myself, and I have got rid of it in the city of Exeter afterwards. When the trawlers come in at Exmouth the fish they have caught are placed in baskets. There are so many soles and so many whiting. They are put away together. Then the small fish are put by for the poor people. They are put in another basket, and then the gurnards are put to the back by themselves. Every trawler as he comes in has got everything ready in baskets, so that the moment he comes in every basket he has can be put on the quay. Then you have a female autioneer who knocks down the fish to any person who will bid for them. So many pairs of soles are knocked down to one person, and so many to another. One man will buy two or three baskets of soles, and they are put in altogether. He is obliged to take them as they come, and frequently the result is that he obtains a lot of fish which he knows he is unable to sell to a tradesman's family. A tradesman with a family will probably have a leg of mutton for dinner to-day. To-morrow he will have hashed mutton, and with a good pair of soles if he could get them for 6*d.* or 9*d.* he would be able to make a good comfortable dinner. When mackerel and other fish come in plentifully, he will frequently have a good dinner of fish. In my time that used to be the ordinary course of living which a tradesman and his family would adopt; but quite a different state of circumstances exists at present. In my day the things that are sold now would have been scouted if they had been offered in the market, and they would never have been looked at. We used in those days to get a moderately sized pair of soles for 6*d.* or 9*d.* Now for the same sort of fish we should have to give from 2*s.* to 2*s.* 6*d.* For a very large pair that we would give 1*s.* 6*d.* for formerly, we should now have to give 4*s.* 6*d.* The consequence is that among the middle classes there is comparatively little fish eaten. It is found better to buy meat even at its dearest price.

19,429. Very true; I apprehend that fish has become dearer, but that hardly bears upon our present inquiry. We do not propose to inquire into the course of trading here. If there is a larger demand for fish the price will naturally be dearer?—They say there is a less quantity of fish caught now than used to be caught formerly, and that being less it is consequently dearer. Indeed it has become so dear that the middle class of society are comparatively excluded from buying fish at all.

19,430. (*Mr. Lefevre.*) Do you mean that there are less fish caught altogether than were caught in former years, or only that there are less caught here?—There are less caught in the river Exe. At one time I used to be able to go out and catch an abundance of fish easily, I have often come home with a large basket full. I cannot do that now. The circumstances are altogether changed; but I think it would be much better if we could have the fish as we used to have them a few years ago. The fish used to come in regularly and we could always get a good fishing. I went to Lympstone the other day, and what was it that I saw there? I met a poor creature hawking a basket of herrings. There was a cold chill wind blowing as if it would blow through her, for she was only half clothed, and she was shivering and miserable. I examined her basket and found that the fish in it absolutely stunk. There was a tear in her eye. I gave her a piece of money and she was gone. That was not so formerly, yet the fishing has come to that miserable state in Lympstone, and I am quite sure it is the same in all the other places round here. There is hardly bread and the common necesssaries of life to be obtained by those who go out fishing. I went into

the fish market this morning, and here (*producing a fish*) is a sample of the brills I got.

19,431. (*Professor Huxley.*) What is the length of that fish?—It is exactly a foot long, and here is another the same size. That also is 12 inches long.

19,432. Who are the people who buy those fish?—I obtained these from Mr. Saunders, a fishmonger here. "This," he said "is what I get up from the Brixham "men, and if I do not have it I get nothing." Feel the thickness of that fish. There is nothing at all in it. It is not sufficient for a quarter of a meal for any man living.

19,433. But who will buy such fish of the fishmonger?—Nobody. That is his complaint. There is no one who will buy it of him and yet he is obliged to take it himself.

19,434. (*Mr. Lefevre.*) What do they ask for fish like that?—They will take almost anything they can catch for it. It is a decided loss to them. Perhaps they will ask 6*d.* for a brill like that.

19,435. (*Professor Huxley.*) Do the poor of this place buy fish of that description in any large quantities?—No, it is too dear for them. They buy the flat-fish and sprats, herrings, hake, and fish of that sort. They do not buy brills.

19,436. But the fishmonger must surely find his account in the matter, or he would not go on dealing with the trawlers?—The effect it has upon him is that he is obliged to charge double what he used to do formerly for the better class of fish. That is the only answer I can give to your question. I can assure you that no later than this morning one of our fishmongers was complaining to me of the difficulty he had in disposing of fresh fish. He told me that if he could get rid of selling them altogether, he would do so with all his heart. He says that he can sell vast quantities of dried fish, such as herrings, but that he has the greatest difficulty in making his own of the fish sent to him fresh by the trawlers, which include such fish as I have just shown to you.

19,437. In point of fact, I suppose there is a great demand for fish, and the fishmonger is obliged to take what he can get?—Yes, that is so.

19,438. But that is only like all other branches of trade when there is a large demand?—I know it is the same in other trades; but what I complain of here is that the trawlers are restricted by law to the use of a certain size of mesh, yet they openly use too small a mesh, and no notice is taken of them, and no steps are taken to put a stop to the violation of the law.

19,439. That is altogether another question?—Then again the nets used inside the river are all of an improper mesh. You will naturally ask me what cure I would propose for that. In my opinion the remedy would be a very simple one. I remember having the honour of being questioned upon one occasion by Sir William Jardine. I told him that I thought there would be no great hardship in allowing a person to go into any of the mills in order to ascertain if there were any engines that were contrary to the law. His answer was that that would be an interference with the liberty of the subject. "But," I said, "the "liberty of the subject is already interfered with. "What do you do with the public houses on the Sun- "day morning? The police have the right to enter "them, and if they choose they can search all round "the house. It could be no greater interference with "the liberty of the subject to allow a person to visit "a mill." Sir William Jardine said he was obliged to me for the suggestion, and I believe that a measure of that nature was subsequently carried in Parliament.

19,440. That was with regard to salmon?—Yes. I think a very simple cure could be applied to remedy the evils of which we are now complaining. I have frequently seen the Preventive men,—the Coastguard men, performing their duty, and a more intillegent and better behaved class of men I never saw in my life. Their chief officer at Exmouth, Mr. Hawkins, is not only talented and clever in his profession, but affable to all who are brought in contact with him. Every information he can afford I am satisfied he is always ready to give with the greatest possible pleasure, and it is the same with all the men under him. I am perfectly sure that any stranger who goes to Exmouth, or any of the Preventive stations, will always be kindly treated. I say this because I know there is a general impression abroad that they are an arbitrary set of men, and that they are of very little real service. No greater mistake could be committed.

19,441. Do you think they are persons who might be entrusted with restrictive powers?—Yes. Mr. Hawkins told me only yesterday, that they already have orders to go in and examine the boats and nets used for salmon. They are also obliged to board every vessel that comes into port in order to search for contraband spirits and tobacco, and it is part of their duty to keep their eye on every boat that goes outside the bay for fish. If they see one go near any vessel that may be passing by then they board it when it comes in to ascertain if anything illegal has been placed on board. Now I will take the liberty to suggest to you that if the size of the mesh of the nets was made larger by Act of Parliament, and particularly in the rivers, and if during the spawning season, for instance, from the latter end of November until February, except for herrings and sprats, the fishing for which ought not to be interfered with, no seines were allowed to be drawn at all, the fishing generally would be greatly benefited. When the time arrives for the use of the seine, then the mesh should be of a certain description, so that the nets would not take all these small trumpery fish. I would further suggest the propriety of having some regularly constituted authority to look after the nets and see that the law is not infringed.

19,442. What size would you have the mesh?—I do not think that you ought to have it a bit less than the mesh of the salmon seines.

19,443. What size is that?—2 inches across.

19,444–5. (*Mr. Lefevre.*) Not from knot to knot?—Yes, from knot to knot. It will be 4 inches when elongated. A shilling mesh from knot to knot will be 2 inches across.

19,446. (*Professor Huxley.*) If you pull two sides of the mesh together so that no chink is left between, one side will be exactly half the length of the whole mesh when pulled out?—Yes; and with regard to the mesh of the seine nets, I would make it 2 inches from knot to knot, the same as the salmon seines.

19,447. Would it be possible to catch a flounder in a net of that kind?—Yes, I think so, very easily.

19,448. Would not a good sized flounder go through a mesh as large as that?—I think not. All the big ones that were worth having we should get still. I have caught hundreds half the size of that (*pointing to a fish in the basket*).

19,449. We have been informed by practical trawlers that if the mesh of the trawl net were larger than $1\frac{3}{4}$ inches from knot to knot it would allow a fair sized sole to pass through. Are you of the same opinion?—The sole I have here is 3 inches across.

19,450. (*Mr. Lefevre*) Yes, but we have been told that a sole will double itself up into a very small space, and that it will pass through a small mesh?—If this were doubled up it would still be $2\frac{1}{2}$ inches across.

19,451. (*Professor Huxley.*) We only wish to put before you the statements which have been made before us in evidence in other places, and among other things we have been told that a full sized sole is capable of doubling itself up so as to get through a mesh $1\frac{3}{4}$ inches from knot to knot; is that your opinion?—No, I do not agree with that at all. In drawing my seine net down at Salmon Pool I have often caught fish of that size, but it was with the old net. Now our net will be 2 inches across.

19,452. With what sized mesh was that fish you have in your hand caught?—It was caught in a regular trawl net and if they will catch fish of that size in the trawl, is it not time that their mesh should be altered and made larger?

19,453. That is another question. The mesh they

EXETER.

J. E. Kingdon.

23 Dec. 1863.

use is rather less than $1\frac{3}{4}$ is it not?—Yes, I have seen some considerably less than that.

19,454. Do you think if the mesh were 2 inches from knot to knot it would prevent the evil of catching these small fish?—Yes, and particularly inside the rivers. If the legislature were only to allow one sized net to be used inside the rivers for all fish, except herring and sprats, namely the salmon net, I think the evils of which we now complain would be remedied to a great extent. I think it would be both wise and right to adopt the salmon mesh for all fish with the exceptions I have named.

19,455. Do you not think that when the seine became a little choked with large fish, you would catch a great quantity of small fish, in consequence of the stopping up of the meshes?—No, I think not.

19,456. That is an objection which has been mentioned to us in other quarters?—I should only like to see the fisherman have the chance of catching small fish in that way. Even if they did catch small fish, it would be a very simple matter to return them to the water again.

19,457. We have been told that it would be impossible to prevent the catching of small fish altogether however much the size of the mesh may be enlarged?—The small fish could be put back again. At Salmon Pool, I have caught from 12 to 15 salmon at one haul, and they were not bad fish either, yet I have been obliged to throw them overboard again. Some of them would be fish of 15 lbs weight. Lots of little ones would get into the net at the same time, but they would pass out easily.

19,458. Then what remedy would you suggest?—If I had any voice in the matter I should say that the Preventive men should board every boat and see that the mesh of every net was of the right size, and they should see also whether all the fish the fishermen had in their basket were right, the same as they now look after a keg of brandy or anything of that sort. I believe there would be no difficulty in the matter. Mr. Hawkins himself aasures me that the Coastguard could perform the duty. They have very little to do now during half of their time. They could go off readily and examine the nets of the fishermen, and their fish also; if they found fish of an improper size itshould be thrown overboard, and the parties using illegal nets should be summoned and fined.

19,459. Would it be necessary to have a series of Preventive men up your river?—No, I think not, our coast is surrounded by them at present.

19,460. If a fisherman is working from Topsham to Lympstone, what is to prevent him from catching small fish and sending them in?—The Exmouth men see everything that comes inside the bay. The Topsham men must go out, and the Coastguard at Exmouth would see every one of them.

19,461. Could the suggestion you make be carried out without any addition to the present Preventive staff?—I think so. Directly opposite the river, at a place called Hangstone Point, there is a Preventive station; then there is another at Teignmouth, and another at Dartmouth. Every night the whole of the coast is perambulated by the Preventive men. I think there would be no difficulty whatever in the matter. They could easily perform this duty in addition to their ordinary work. Indeed, Mr. Hawkins himself says, "Give me the order to search the nets "and the boats, and you shall have no trouble or "expense in the matter."

19,462–3. There are two things you desire; in the first place you are of opinion that the mesh should be 2 inches from knot to knot, and in the next place you think that all fish below a certain size ought to be seized?—Yes.

19,464. Is there anything else you desire?—No.

19,465. Would you have any close time?—Yes, I would have a close time.

19,466. What time would you fix?—You have a close time now for salmon from the 1st of September to the 1st of February; then why not have a close time for the sea fisheries, say from the 1st of November. I would give them the opportunity of fishing till that time, and then I would not let them put a seine in the mouth of the river when the fish come in to spawn.

19,467. How long would you prevent them from fishing?—Until February or March.

19,468. From November to February?—Yes.

19,469. Then how would you catch sprats?—I would make an exception of sprats and herrings.

19,470. But if you catch sprats will not a good many small fish of other descriptions get in?—Not if the Preventive men are there to see what the fishermen take ashore. Other fish might be taken, but of course they would be returned to the sea again. I should not fear that any small fish would be taken.

19,471. Do you think that permission could be given to catch sprats without interfering with other fish; do you think that sprats could be caught without catching other fish with them?—I think the fishing might be so regulated that no injury would be done to other small fish.

19,472. Have you anything else you wish to suggest?—I have only to add this, that I hope you will do your best, and I trust Her Majesty's Government will do their best for the middle classes of society, to which I belong. At present we find ourselves unable to buy fish for food, and if we ever have it at all, it is only as a matter of luxury.

19,473. There are some other modes in which the fisheries here have suffered upon which we may require further evidence. You have spoken of the loss you have sustained in your oyster beds in consequence of not being able to obtain a supply from Falmouth, and you have stated that that is owing to the French demand being so great that the Frenchmen can afford to pay a higher price for the oysters than our own countrymen?—Yes, that is so.

19,474. How do you see your way in that matter? What remedy would you apply?—I would have a harbour master, as they have in Jersey, and I would not allow any oysters to be removed from the beds that were under a certain size.

19,475. Would you prevent the taking of oysters fit to be laid down on breeding grounds elsewhere?—At present they take the smallest oysters it is possible to dredge up.

19,476. Do the Frenchmen who get those oysters lay them down on their own beds?—Yes; but in taking them up they destroy all the small brood, and all the spawn as well. They take away oysters which in another year would grow larger, and be spawning themselves.

19,477. You do not propose to prohibit the export of oysters from this country to France, but you think they ought not to be allowed to be taken away under a certain size?—Yes, just so. I do not see how we could prohibit the export of oysters to foreign ports altogether. The principles of free trade would interfere with us there.

19,478. Then I do not see how you would be benefited here at Exeter, because if they are not to be allowed to be taken away under a certain size, the prohibition will hold as good with regard to this place as with regard to France?—I am aware of that, but I think we should be enabled to get superior oysters by giving a little more money for them, and that I think we should be contented to give.

19,479. Could you afford to give the large prices which you have mentioned to us, and which you say are given for oysters at Falmouth by the Frenchmen?—I question whether we could; but I think you would drive the foreigners away in a great measure, and then our fishermen would stand a better chance of obtaining oysters at a reasonable price.

19,480. But if there is a great demand for oysters in France, would not that demand still remain?—Yes, it might.

19,481. Then what advantage would you derive?—Although the demand for oysters might continue as great in France, yet if they knew that they could only get them in this country of a certain size, I

think they would find it hardly worth their while to send over for them.

19,482. (*Mr. Lefevre.*) Are not the best oysters, and those which obtain the largest price from consumers, those which are removed from the original breeding grounds, and laid down on other beds that they may grow up?—I cannot answer that question. I do not know.

19,483. (*Professor Huxley.*) There was another question you raised in reference to the mussel fishery here. I understood you to say that you had a fishery for mussels here at one time, but that of late years it has been ruined in consequence of Dutch competition?—Yes, that is so.

19,484. Then how do you propose to remedy that?—I cannot say. In that case I would leave the remedy to wiser heads than mine.

19,485. Do you think that it is possible to apply any remedy to that?—No, I do not know any remedy for it. Mussels are very little used in this part of the world. When we had a sale for them they generally went to London. We consume hardly any here.

19,486. (*Mr. Lefevre.*) Are the mussel beds here increasing?—Yes, but the quality of the mussels themselves is growing worse, I believe.

19,487. What is the reason for this?—I do not know. I cannot pretend to say what is the reason. Then again with regard to the cockles, I think some steps ought to be taken to prevent the injury that is now done to the beds. Of course if you or any other gentleman go down with your family to the sea side you are fond occasionally of having a good basket of cockles. But that is impossible here now in consequence of the way in which the beds have been fished. At one time there was no place more celebrated than this for the fineness of its cockles.

18,488. Are the cockles you get here now not fit to eat?—No, there is nothing in them.

19,489. But they are eaten, are they not?—Yes, they are eaten, but unless something is done to regulate the mode in which they are to be taken there will soon be none left.

19,490. What do you propose as a remedy for the evil of which you complain?—I think that no cockles ought to be allowed to be taken up under a certain size. You would then have only those that are worth eating and are really nutritious food.

19,491. How would you prevent small cockles being taken with the larger cockles?—I would require them to be run through a sieve, and those that passed through I would have placed back again in their proper places on the beds.

19,492. (*Professor Huxley.*) Within your recollection have you found that the quantity of fish sent from this place inland has increased or decreased?—According to my notion it has decreased considerably.

19,493. Do you send any fish by railway to London?—I think not. I believe that no fish goes from this place to London by railway at all.

19,494. None at all?—I think not, but large quantities go from Brixham. I have seen them bought there over and over again for the inland towns. They send them to Bath, Bristol, and Taunton principally, I believe.

19,495. The railway people here do not send any to London?—No, I think not. In point of fact we can get fish down here from London cheaper than we can buy it here. If I choose to send up to London for fish I can get it down for two-thirds of the price, even after paying the railway carriage and all the expenses that I should have to pay here. We have a respectable innkeeper here at the Half Moon, and whenever he happens to be called on to provide for a large party he always sends up to London for turbot and for his fish generally. I believe he is able to get it down for half the price he would have to pay if he bought it in the city.

19,496. Do you consider that the falling off in the quantity of fish caught here is due entirely to the wasteful mode of fishing that is practised?—Yes, I do. I believe that if the mode of fishing was regulated the fish would soon become plentiful.

19,497. Do you think that if all the small fish which are now caught were allowed to escape they would all grow up to be big ones?—Yes, I think they would generally, but of course you must always make allowance for the number of small fish that are destroyed by the large ones. The greater part of those which are now destroyed when small by the mode of fishing practised would in my opinion soon become large fish fit for the market.

19,498. Is there any other subject upon which you can give us information?—There is one thing to which I wish to call your attention. So far I have particularly avoided saying anything about the salmon.

19,499. We are only empowered to enquire into the condition of the deep-sea fisheries?—I am aware of that, but there is one remark with regard to the salmon which I think I may be allowed to make. I am happy to say that since the recent Act of Parliament was put in force the salmon here have been increasing in the most wonderful manner. I have myself seen dozens in the pool trying to get over the weir. I never saw such a thing in my life. I know of my own knowledge that, owing to the regulations which have been imposed by the legislature, the salmon here have increased at a most astonishing rate. About April or May all the young of the salmon go down and stay in the river for several days, perhaps a week, in the brackish water. I suppose that is in order that they may become accustomed to the change of water before they go into the sea direct. If you allow small fish to be taken, what is to become of these graveling, when they are lying down in the pits in the river. It is well known that they do lie there before they go out into the sea, and do you suppose that a Topsham fisherman when he is taking an old fish or a salmon peal will not take these little graveling? They take anything that comes within their reach, and are not at all particular. Therefore I am of opinion that they interfere very considerably with the salmon fishery, and that they destroy a large number of the young.

19,500. (*Mr. Lefevre.*) You were speaking of oysters being brought here from other places, and laid down on banks?—Yes.

19,501. Are the banks to which you refer private banks?—Yes, the bed of the river is the place where they are laid down, and the Lympstone fishermen divide out the banks.

19,502. But are they private property?—Yes.

19,503. Do the fishermen pay anything for the right of laying down the oysters?—Yes.

19,504. Who claims the property?—Sir Drayton Drake is lord of the manor at Lympstone, and the Earl of Devon is lord of the manor at Starcross.

19,505. Have the oysters ever bred there?—No, I think not.

19,506. Have you ever tried whether oysters will breed in the bed of the river?—No, the breeding of oysters about here is very little, I believe. I have myself been out dredging here, but if you catch a great oyster it is easy to see that it is not the sort we have. There are a few, I believe, got down in the bight between Exmouth and Lympstone.

19,507. If you were to lay down oysters in the bed of your river have you any reason to believe that they would breed there?—I do not know. I cannot answer that question.

19,508. I think you said that the whole quantity of fish caught about here has decreased of late years, compared with what it was formerly?—Yes.

19,509. Has the number of men engaged in the fishing decreased also?—I think the number has decreased slightly, but I cannot say positively.

19,510. Have you any means of getting that information with regard to the number of fishermen?—Certainly, it can be obtained if you wish to have it.

EXETER.

J. E. Kingdon.

23 Dec. 1863.

19,511. And also a comparison of the number engaged in the fishing now with what it was 15 years ago?—There will be no difficulty in supplying you with that information.

19,512. Then perhaps you will be good enough to forward it to the secretary?—Yes, with pleasure. My only object in appearing before you to-day is to do all I can to increase the productiveness of the fisheries. I am quite sure that if we can succeed in doing that we shall do a great amount of good to the poor men engaged in them.

19,513. I think you said that a great number of small trawlers come off this part to trawl?—Not directly off this port. There are only six trawlers here and not one at Lympstone.

19,514. Then do the trawlers to which you referred come from other parts?—Yes.

19,515. Where do they come from?—I think Brixham is the principal place.

19,516. Are there not a number of small trawlers belonging to the ports in this neighbourhood?—Exeter is one port, Teignmouth is the next. There is nothing at Dawlish, I believe. The next is Budleigh Salterton, and they have one there, I think.

19,517. The trawlers are open boats here, are they not?—Yes, they are open boats. If we had a harbour for them we might have larger vessels, but having no harbour they could not go out and in.

19,518. Do you mean that they cannot be dragged up the beach?—Yes; they could not be dragged up. The smallest of them will be from four to five tons.

19,519. But we have seen larger boats than that dragged up on the beach in other places?—I do not think that could be done here.

19,520. What is the size of the mesh of the trawl net used by the trawlers from Exmouth?—I do not know the exact size, but I should say it is from $1\frac{1}{2}$ to $1\frac{3}{4}$ inches from knot to knot.

19,521. Are you aware whether that is a legal mesh or not?—No, I cannot tell.

19,522. Have any means been taken to ascertain whether the trawl-boats used at Exmouth carry nets with a legal mesh or not?—I cannot say; but if not, means can easily be taken to ascertain that fact.

19,523. Have you ever heard of the nets being examined?—No.

19,524. You have never heard that there has been any inspection of the nets of the trawl-boats?—No, I think they have never been inspected by anybody. If you inquire particularly into the matter I think you will find, if you go to Exmouth, that they have a large number of seines there, which they use in drifting for herrings, and in the centre of all those nets they use the small mesh. I believe it is considered desirable by everybody that the small fish should not be caught, and I believe there is an Act of Parliament which fixes the size of the mesh that is to be used in fishing for herrings. Under those circumstances I think it would be wise to have that Act carried out, so that the fishermen should not be aollwed to use a herring mesh less than the proper legal shilling scale.

19,525. Are there any shrimpers along this coast?—I believe there are only very few; but there appears to have been a slight increase in the take of prawns. I have had more prawns this year from a man at Exmouth than on any former occasion, but I believe that the prawn fishery here is not of much consequence.

19,526. Do the persons engaged in catching prawns take many small fish in their nets?—Hardly any at all, I think.

19,527. What sort of nets do they use?—They are small round nets about 3 feet across. They are let down the ledges of the rocks and are pulled up again every now and then.

19,528. Do the men who fish with the seine nets bring in the fish dead or alive?—They are all alive.

19,529. Then in that case the fish could be thrown back again into the sea without being destroyed?—Yes. We draw in the seines very rapidly.

19,530. How long does it take to draw in one of your seine nets?—We can draw in a seine in five minutes. We always draw them in as fast as we can. We see at once what we have got. We keep all the fish that are of any use to us, and we throw the rest back again into the sea. What I complain of is, that some of the fishermen will not stop to do this. They throw them out of their nets on to the mud banks or anywhere. They do not care whether they put them back into the water or not, and the consequence is that the gulls and the shags and other birds come and eat them.

19,531. I think when you said you would put a stop to fishing with nets with a small mesh during a certain fixed time you made an exception of the sprat net?—Yes.

19,532. Why did you make an exception of it?—I think we must make an exception of the sprat net. The sprat is a very valuable fish for our poor people here.

18,533. What ought to be the size of the mesh of the sprat net?—I do not know the exact size, but it must be a small mesh to catch sprats. What is used here is what we call a capelin net, if you know what the capelin mesh is. But when they are fishing for sprats I think the Preventive men ought to be about in order to see that they do not take anything else.

19,534. Would you have Preventive men on the watch to see that the fishermen threw back into the sea all the other fish they caught?—Yes.

19,535. What is the number of persons who are engaged in the sprat-fishing here in the course of a season?—All the men go out fishing for sprats. The sprats generally come into the harbour, and as soon as they do so all the nets and men are out after them.

19,536. Have you any notion of the number of men employed in the sprat-fishing?—No, I have not.

19,537. Are there as many as 40 or 50?—There are five or six boats.

19,538. Do you think it would be feasible to have them looked after by the Preventive men?—Yes, certainly. I would have every one that goes out looked after, gentle or simple. Their nets should be examined to see that they were of the proper size, and that they take in nothing but what they are intended by the Act of Parliament to catch.

19,539. Would it not be necessary to have men specially appointed to look after the fishermen?—Not at all. The Preventive men know them all very well, and if they knew they were likely to be examined they would not dare to fish illegally.

The witness withdrew.

S. Willesford.

SCOBLE WILLESFORD called and examined.

19,540. (*Professor Huxley.*) What is your profession?—I am a solicitor.

19,541. A solicitor in this town?—Yes.

19,542. Have you been acquainted with the town and neighbourhood for a lengthened period?—For more than 20 years.

19,543. Have you taken much interest in the fishery question here?—Yes, I am secretary of the Salmon Fishery Association.

19,544. I presume you are aware that the object of our inquiry is the deep-sea fisheries, and not the salmon fisheries?—Yes, but I am anxious to call your attention to a point which has already been referred to by Mr. Kingdon, namely, to the fact that a considerable destruction of small sea-fish of all classes, such as turbot, soles, brills, &c., is constantly going on. Such fish must inevitably be caught owing to the size of the mesh used by the fishermen. Now, I apprehend that you will experience considerable difficulty in dealing with the question of the size of the nets, and

in prohibiting those of a certain class. Seeing that such a difficulty does exist, I would take the liberty of offering a suggestion.

19,545. What would you suggest?—I would suggest this: that any legislative enactment that may hereafter be made, to be of any practical utility, must embrace stringently this point, namely, the possession of fish under a certain size. It should be distinctly laid down that if turbots, or soles, or whiting, or any other fish, are caught by the men, and found in their possession under a certain size, the fact of having them in their possession would subject them to a penalty. It is notorious, as Mr. Kingdon has already told you, that thousands and tens of thousands of small fish are taken here and wantonly destroyed. The moment the larger fish are taken out of the nets these small fish are shaken upon the banks and there they are allowed to perish. They are either eaten by the birds, or they die and are destroyed in other ways. Of course there must be considerable difficulty in dealing with the question of the size of the mesh. You must allow these men to catch sprats, and when they are engaged in catching sprats their nets will catch anything else that happens to get into them. It is absolutely necessary then, in that case, that they should be allowed to catch other fish in obtaining the fish they really require for the purpose of sale. To do that properly they must be allowed to fish with nets of a certain mesh. Therefore if you can get an Act of Parliament passed so as to enable the proper authorities—either the Coastguard, or the police, or any other body—to institute a constant inspection of the boats with a view of ascertaining the nature of the fish caught, I think that would be sufficient. Of course there must be a penalty imposed for the possession of fish under a certain size.

19,546. Are you of opinion that that would remedy the evils complained of here?—Yes, I think that would be your only remedy, provided you find that you cannot deal with the question of the size of the mesh of the nets, which, I must admit, is an exceedingly difficult question to interfere with.

19,547. Is there any other suggestion you wish to make?—There is only one thing which I wish to add. I think Mr. Kingdon is quite mistaken in supposing that oysters do not breed here. My opinion is that they do breed here, but the fishermen take up the oysters at an improper time and without exercising due care. The consequence is that they take the shell of the oysters entirely uncleaned of the young which may have been adhering to them. At certain seasons of the year the shell of the oysters here is found covered with a number of small oysters. Probably, upon every oyster taken up, there may be from 8 to 10 or 12 of these small oysters attached to the shell. A scheme has been suggested for the preservation of these young oysters, and I believe that it has already been acted upon in the Menai Straits, where means have been adopted for disconnecting these small fish from the larger ones, and they have been returned to the water. Every shell has been cleaned, and the consequence is, as I have been given to understand, that where one oyster is got up for the market more than 20 are dropped back again, in order to enable the beds to renew themselves. Now I think there is a possibility of doing that with the same success in the estuary of the Exe; I have no doubt that, at one period, the Lympstone and Starcross oysters were considered an article of great delicacy and luxury.

19,548. You are of opinion that oysters would breed here if proper measures were taken to protect them?—Yes, from the inquiries I have made, I have no doubt that they would breed here, and that the oyster fisheries, in the course of a few years, could be made almost self-supporting. I am not aware that there is anything further I can tell you. My friend Mr. Kingdon has already taken up all the ground, and has left nothing to be added.

19,549. A question suggests itself in connexion with the remarks you have just made in reference to the oysters. You say that you would have the oysters cleaned as they are taken from the beds, and the young oysters returned to the beds?—Yes.

19,550. Do you not think that the necessity for doing that on the part of the fishermen would oblige them to spend a vast amount of time over the fishing?—No doubt the fishing would occupy more of their time than it does at present, but there would be a corresponding saving in obviating the necessity for procuring oysters from other places. In consequence of the deficient supply here, they are obliged now to bring considerable quantities from Jersey, Guernsey, the coast of France, and the coast of Holland. That can only be done at great expense, and if, by protecting the brood, they could always be sure of an adequate supply here, they would save a considerable sum in the expense of shipping as well as in the cost of the oysters they are compelled to purchase. In my opinion, that would be more than an equivalent for the extra labour they would have to perform in cleaning the oysters on the beds here, added to which, they would be saving the common wealth instead of destroying it.

19,551. I have no wish to dispute the excellence of the plan you suggest, but I put it to you, as a practical man acquainted with the mode in which dredging for oysters is carried out, whether it would not involve a considerable amount of additional labour to the men engaged in the fishing?—No doubt it would.

19,552. I have been out oyster dredging, and I have seen the oysters taken up in large masses and placed in the bottom of the boat. The men themselves are glad to get back to shore in coarse weather. It therefore suggests itself to me that the cleaning of the oysters as they are dredged up would take considerable time, and might be found very inconvenient?—It might be found inconvenient, but, as I have already remarked, there is another element which ought also to be borne in mind, and that is the saving of expense. If the fishermen here could obtain a sufficient supply of oysters from their own beds, they would save a considerable sum in the cost of shipping and obtaining oysters from other places.

19,553. Then, with respect to the sprat-fishing, you say that you would permit the use of a small-sized mesh in that fishing, but you would prevent them from taking other small fish?—Yes.

19,554. Do you think that it would be possible to carry out such a regulation?—Yes, I do not think there would be any difficulty.

19,555. Would you have it a summary process before the magistrates?—No.

19,556. Then how would you proceed?—I would give to some particular authority, such as the Coastguard, the power of entering the boats in order to ascertain whether there had been any violation of the law or not. At present that is the great difficulty we have to contend with. There is no power of seizing the small fish after they have been caught, and what we want is an Act of Parliament that will give that power and enable the offenders to be summoned before the magistrates. I think that would be the best summary we could have. The penalties attached should be small in the case of a first offence, but they should be gradually increased in the case of fresh commissions of the offence. I also think that in the case of an incorrigible offender the magistrates should have the power of awarding imprisonment. I need not tell you that to these men as a body a fine would be a mere nothing; they would raise the sum among themselves, and would repay themselves by doing the same thing subsequently. Under those circumstances, if they got hold of an incorrigible offender, I would suggest that imprisonment should be added after a certain number of convictions.

19,557. Do you not think that a sprat fisherman using his net in good faith, may mix up with his sprats small fish of the prohibited kind?—Most unquestionably he would do so; he would bring up small fish of other descriptions as well as sprats; but

EXETER.

S. Willesford.

23 Dec. 1863.

I think there would be no difficulty, if he chose to take sufficient trouble, in returning the fish that would be prohibited into the water again. I think that could be done with very little difficulty.

19,558. I presume you are aware that sprats are often taken in a very large mass in the sprat nets?—I am quite aware of it.

19,559. Then to sort them in order to remove small fish of other descriptions would occupy considerable time?—Yes, it would.

19,560. Would it not seriously impede the fishermen in their occupation?—I do not think it would; and as there is a possibility of the fish being returned to the water again without injury, I think it ought to be done. All these fish are, I believe, very tenacious of life; a sole will live for a considerable time after it has been taken out of the water.

19,561. (*Mr. Lefevre.*) There is one question I wish to put to you in reference to the breeding of oysters. Do they breed below the low-water mark?—On the banks just at the edge of low-water.

19,562. Just below low-water mark?—Yes.

19,563. Are they the oysters that are brought here, or are they indigenous oysters?—They are indigenous oysters.

19,564. Do you agree with the last witness that the oyster will not breed here?—No, I do not agree with him; I think the indigenous oyster here is an article that may be made of great value.

19,565. Is the whole of the river here private property?—One portion belongs to the Earl of Devon, and the other to Sir Drayton Drake.

19,566. Does the bed of the river belong to anybody?—I have a strong opinion that it does not, but that is a question of law.

19,567. Are there any portions of the bed of the river where private persons have the exclusive right of oyster fishing?—The oyster beds are let out in certain portions by Lord Devon and Sir Drayton Drake. They are not breeding places, however, but merely places where the oysters are deposited.

19,568. In order that they may fatten?—Yes.

19,569. With regard to the breeding of oysters, are there any places where private persons can put down oysters for breeding purposes, and prevent other persons from dredging them up?—No.

19,570. Are there any means by which such places could be provided in the bed of the river?—I am not sufficiently acquainted with the subject to be able to tell you that.

The witness withdrew.

J. Drew.

JOHN DREW called and examined.

19,571. (*Professor Huxley.*) You are steward to the Earl of Devon, I believe?—I am.

19,572. Have you acted in that capacity for many years?—Yes, for 20 years.

19,573. You are very well acquainted, I presume, with the west shore of the river?—Yes.

19,574. And you are acquainted with the condition of the people engaged in the fishing there?—Yes.

19,575. Are they in a great measure tenants of Lord Devon?—Yes, the greatest part of them on the west side.

19,576. How many persons are there engaged in the fishing on the west shore, in Starcross, for example?—That is a fishing village, but I believe that the number of fishermen there are reduced in number very considerably; there are very few there now who can be termed fishermen.

19,577-9. Have you any notion of what the number is?—There are not half a dozen there who get their living by fishing.

19,580-1. Are there any at Powderham?—There are none at Powderham, I believe.

19,582. Starcross is the only place that contains any fishermen worth speaking of?—Yes.

19,583. Within your recollection, was the number of fishermen there much greater than it is now?—Yes.

19,584. What was the number 20 years ago?—I do not know the exact number, but it was two or three times as large as it is now.

19,585. Was there a proportionately larger number of boats?—Yes, I think so.

19,586. How many boats are there at Starcross now?—Do you mean fishing boats?

19,587. Yes.—Not more than three or four, I believe.

19,588. Are they very small boats?—They are boats of about 4 or 5 tons, or something like that. Perhaps they may be less than that; I do not know much about the boats.

19,589. Has the condition of the people there become depreciated since you have known the place?—They have had other means of getting a living since the railway was introduced there. A great number of the fishermen have applied themselves to the business of taking passengers across the river; that has turned the attention of many of them away from the fishing.

19,590. So far as it depends upon the fishing, would their condition have been much depreciated?—I have no doubt that it would.

19,591. What in your opinion is the reason of that?—The scarcity of the fish.

19,592. Within your own recollection, can you speak of an abundance of fish in the river?—Yes.

19,593. Were the fish much more abundant 20 years ago?—Yes, they were much more plentiful than at present.

19,594. Considerably so?—Yes, I think so. I used to see them brought about then in much larger quantities than now; one rarely sees a basket of fish caught in the river now, but it was frequently the case then.

19,595. Was any quantity of the fish caught then sent inland to market?—It was not sent to any long distance.

19,596. How was it disposed of?—It was generally hawked about by people in the neighbourhood.

19,597. Is there any fish sent away from Starcross by railway now?—No, I think not unless there is a considerable quantity of herrings caught. They would be sent away by railway.

19,598. To what cause do you ascribe the falling off of fish in the river?—I cannot, from my own knowledge, give you any reliable information on that subject, but I have heard that it is owing to the smallness of the nets, or rather of the mesh of the nets, used by the fishermen.

19,599. Are you aware whether that is the opinion of the fishermen themselves?—I believe it is. Those who really wish well to the fishermen have told me so, and they say it is desirable that the use of nets of so small a mesh should be prevented.

19,600. (*Mr. Lefevre.*) Are there any seine fishermen in attendance here?—I have brought a couple of men with me who will be able, I believe, to give you a much better account of the actual working of the fisheries than I can.

19,601. (*Professor Huxley.*) Has Lord Devon any interest in the oyster beds here?—Yes, he is lord of the manor, and he owns the soil of the Exe, within certain limits from Darling's Rock to Exmouth and to Cheekstone, within the bar.

19,602. The foreshore over that extent is owned by Lord Devon?—He owns the bed of the river and the foreshore as well.

19,603. Has there being any question raised as to the rights of Lord Devon in that respect?—Yes, a question was raised, and it has been decided in Lord Devon's favour.

19,604. (*Mr. Lefevre.*) The bed of the river is the the property of Lord Devon as well as the bank?—Yes.

EXETER.

J. Drew.

23 Dec. 1863.

19,605. (*Professor Huxley.*) Have the oyster beds here diminished in value of late years?—I cannot answer that question. The value to Lord Devon has not diminished. He only received a nominal rent.

19,606. What rent has he received?—He has received a nominal rent of 1*s.* a year for a certain space marked out, so as to give the people of the place engaged in the fishing, an opportunity of protecting their own property. The rent has not been charged by Lord Devon with a view to any personal benefit to himself.

19,607. Has the value of the oyster beds to the people who rent them fallen off?—Yes, considerably.

19,608. Do you agree with Mr. Kingdon in the statement he has made to us as to the cause of the falling off?—Yes.

19,609. That it is in consequence of the increased price of oysters at Falmouth?—Yes.

19,610. The cause of the falling off has nothing, in your opinion, to do with the fishing in the river?—Certainly not.

19,611. Have the oysters here much fallen off?—Yes; the breeding of oysters in the Exe has fallen off considerably during the last 25 years. There was a time when the water bailiff of Lord Devon used to prohibit the fishermen from dredging for oysters in the river, except between Michaelmas and Christmas, and then they were only permitted to dredge for two days in the week.

19,612. (*Mr. Lefevre.*) Has Lord Devon a right to the oyster-fishing in the river?—Yes.

19,613. You say that the quantity has very much fallen off?—Yes.

19,614. Is that the reason there are no restrictions as to the fishing now?—Yes, the quantity in the river has become so small that the water bailiff does not look after it now at all. In former years the boats used to come in to dredge twice a week between Michaelmas and Christmas, and the water bailiff took a certain amount of toll from them.

19,615. Are you enabled to state what is the cause of the falling off?—No.

19,616. You can form no opinion?—No. It is because the beds have been destroyed in some way.

19,617. I understand, from what you have already stated, that Lord Devon has at present the power of limiting the amount of dredging, and that he can exercise it if he desires?—Yes.

19,618. Then the falling off has not, in your opinion, been the result of the river having been overfished?—I think it must have been overfished at some time, but how the scarcity has really occurred, I cannot, of my own knowledge, state.

19,619. Do you think that the oysters no longer breed there?—No.

19,620. Do you think that they do breed there?—Yes, they do breed there.

19,621. But they do not grow to the same size they did formerly?—In fact, they are not allowed to do so.

19,622. How is that?—The oysters are not protected as they were in former years, and they are taken away before they are allowed to come to any size.

19,623. Would it not be worth while for Lord Devon to enforce regulations as to the time during which the fishermen should dredge and the mode in which it should be carried on?—In fact, when restrictions were imposed it was found that the fishery caused a great deal of trouble and very little profit.

19,624. I presume that Lord Devon has an ancient charter giving him an exclusive right to the oyster-dredging in the river?—Yes.

19,625. (*Professor Huxley.*) Has he any control over the other fishing?—He has no control over the seine-fishing.

19,626. Does he own the bed of the river?—All within the manor of Kenton.

19,627. But it does not lie in his power to exercise any control over the destructive modes of fishing which you have described to us?—Not over the seine-fishing.

19,628. (*Mr. Lefevre.*) Only over the oyster-fishing?—Yes.

19,629. Has he ever attempted to limit the number of persons who were to dredge for oysters?—Yes.

19,630. In what way?—The right of dredging used formerly to be limited to the people who lived within the manor.

19,631. But of late years there has been no attempt to limit the number?—No.

19,632. Does Lord Devon still claim the right to regulate the fishing and to limit the number?—Yes.

19,633. But he does not think it worth while, in order that he may keep up the breed, to do so?—No.

19,634. (*Professor Huxley.*) Was the supply of oysters in the river at any time of consequence to the town of Exeter; would it be of any material consequence to the town that there should be a supply in the river?—No; not to the town of Exeter, but to all the neighbouring villages it was a matter of consequence.

19,635. You think that the people in the villages in the neighbourhood are really worse off from the want of being able to collect that article of food?—I think there is no doubt about it.

The witness withdrew.

W. S. McLaughlin.

William Scott McLaughlin called and examined.

19,636. (*Professor Huxley.*) Are you a fisherman?—Yes.

19,637. Where do you live?—At Powderham, near here.

19,638. On the west shore?—Yes, opposite Lympstone.

19,639. Is there any fishing going on there?—I am a fisherman there, and there is also my brother, who is a fisherman. I believe that is all.

19,640. Two persons?—Yes.

19,641. Do you and your brother support yourselves entirely by fishing?—Yes.

19,642. Do you cultivate the land at any time?—No; we have shell-fish boats as well.

19,643. Do you act as labourers?—No.

19,644. You support yourself entirely on the water?—Yes.

19,645. How long have you been employed in that way?—I have never done anything else.

19,646. How long is that?—About 30 years.

19,647. Was your father a fisherman?—He was.

19,648. When you first began, were there many more persons engaged in that business than there are now?—Yes, hook-and-line fishermen.

19,649. Did they fish outside?—They fished in the river.

19,650. How many were there?—I have seen as many as 50 hook-and-line boats fishing in the river.

19,651. Did they all come from Powderham?—No, from Starcross, Exmouth, and Lympstone, principally. There were never more than two from Powderham.

19,652. But you have seen as many as 50 together?—Yes.

19,653. They came from all the villages round about?—Yes.

19,654. Were these boats hook-and-line boats altogether?—Yes, they were hook-and-line fishing boats.

19,655. Were they the same persons as those who fished with nets at other times?—Some were, and some were not.

19,656. What was the total number of fishing boats at that time, at a rough guess?—About 50.

19,657. How many are there now, altogether; I suppose you know them all?—I do not believe there is any regular fisherman.

EXETER.

W. S. McLaughlin.

23 Dec. 1863.

19,658. Nobody but yourself and your brother?—Yes; we get the bulk of our living from shell-fishing.

19,659. I am speaking now of all kinds of fishing; how many persons are there who get their living by fishing as much as yourself and your brother?—Perhaps 20 or 30.

19,660. Then I shall be safe in saying that there are not half the number that there were in former years?—Yes.

19,661. What is the cause of that?—I have not been out fishing with hook and line for four years as I used to do, and for this reason, that I cannot catch anything when I go out.

19,662. Were you ever a seiner?—I have never kept a seine of my own, but I have got a herring drift-net.

19,663. What is the cause of the fish having fallen off?—Because the small fish have been allowed to be caught.

19,664. Did you hear Mr. Kingdon's evidence?—Yes.

19,665. Do you agree with it?—Yes, the whole of it.

19,666. Have you seen the destruction he referred to going on?—Yes, and ten times more of it.

19,667. When did they begin to seine at Topsham; how many years ago?—They always worked the seines.

19,668. Did they work them when you were a boy?—Yes.

19,669. When did the supply of fish begin to fall off?—When they began to use the little seines.

19,670. Were the seines of a different sized mesh when you were a boy from what they are now?—No, but the men who used them were of a different mind then from what they are now; they only fished for the large fish; they catch all the small ones now. If they caught them when I was a boy they put them back again. Of course it took a great deal of time. I should say that they were ten times longer picking the small ones out then they were in making the haul. I have heard my father say that frequently.

19,671. How many seines were there 30 years ago when you began fishing?—There were the same number that there are now.

19,672. Have they neither increased nor diminished?—I do not think they are more or less.

19,673. Were they worked by the same men as those who worked the hook and line?—A great many of them at Lympstone, Starcross, and Exmouth, but not at Topsham.

19,674. What are they at Topsham?—They are seiners altogether.

19,675. Did the other men object when the small seiners destroyed so much small fish?—No, when they began, one and all did the same.

19,676. But at first they fished fairly?—Yes.

19,677. They took great pains to pick out the small fish?—I have heard my father say that it took ten times as long to pick out the small fish as to make the haul.

19,678. When did they first become careless about it?—The fish began to get scarce about 10 years ago.

19,679. Do you date from that the time when they began to be careless?—Yes.

19,680. Were they not aware that they were injuring their own interests?—Yes, and I think that if there was an Act to make them fish fair they would not object to it. If one of them would fish fair, I think the whole of them would.

19,681. They refrained from picking out the small fish because they wanted to get back to market sooner?—Yes, they used to throw it out on the bank instead of taking it into deep water.

19,682. Are you of opinion that if there was a prohibition against these persons having small fish in their boats it would be sufficient to remedy the evil? Do you think in that case that the fishing would return to what it was formerly?—Yes, I do.

19,683. Do you think it would be necessary to increase the size of the mesh?—I think if you were only to use a salmon mesh you would not catch small fish.

19,684. Have you also used a seine net?—I have never kept a proper seine, but I have sometimes been out with one.

19,685. Have you ever been trawling outside?—No.

19,686. You have altogether confined yourself to the river fishing?—Yes.

19,687. (*Mr. Lefevre.*) I think you are principally engaged in the shell-fishing?—Yes, and I go over the bar for the shell-fish, and for hook-and-line mackerel, in different seasons of the year.

19,688. But you mainly fish for shell-fish?—Yes.

19,689. What shell-fish do you get principally?—Oysters, mussels, and winkles.

19,690. Do you agree with the first witness that the demand for mussels is not so great as it was some time ago?—No, it is not, and we have not been getting many good fish for the last year.

19,691. Have they increased in number?—Yes.

19,692. And they have diminished in size?—They have not diminished in size, but they were not fat fish.

19,693. How do you account for that?—I don't know how to account for it.

19,694. For how many years have you noticed this?—During the last two or three years. I think if we got our mussels fat fish again we should get the same market for them at Billingsgate that we used to have.

19,695. Have you noticed any falling off in oysters?—Yes; we cannot get many to lay down now without giving 10*s*., or 12*s*., or 14*s*. a tub for them, and that will not pay us. A few years ago the price was only 2*s*. up to 4*s*. a tub.

19,696. It does not pay you at 12*s*. or 14*s*. a tub to bring them here and place them on your beds to fatten?—No.

19,697. What price did you formerly give for them?—Three years ago I got them for 3*s*. a tub.

19,698. What are they now?—From 10*s*. to 14*s*.

19,699. Has the trade been drooping since then?—Yes.

19,700. Have you ever dredged for oysters in the bed of the river?—Yes.

19,701. Are there many to be found there?—Not enough to pay for the work.

19,702. Are there men who have dredged there habitually for oysters?—Yes, more or less. I saw a man dredging there to-day as I came along.

19,703. Do you think the oysters breed there?—Yes.

19,704. Are there as many as there were formerly?—No, because when I was a boy we were able to catch from 15 cwt. to a ton per day.

19,705. Do you think the falling off has been occasioned by over-dredging?—No, they don't breed so much, I think. Formerly they used to throw over all the small ones; now they catch and bring everything away.

19,706. That is much about the same thing as over-dredging?—Of course, if you carry away the brood they will not breed on your beds.

19,707. Then would it be better to leave the large oysters for breeding purposes, and take away only the small ones?—Perhaps it would, but the young ones spawn as well as the large ones.

19,708. At what time of the tide do the seine fishermen here begin fishing?—At half ebb.

19,709. What is the width of the river at the lowest tide?—At some places it is not more than 20 or 30 yards across, and in others from 40 to 50 fathoms.

19,710. What is the average width?—Something between the two.

19,711. Can they put the seine right across?—Yes.

19,712. And draw it to one side?—Yes.

19,713. And they can sweep every fish out of the river?—Yes.

19,714. What is the nature of the bottom of the river below low-water mark?—Sand and mud.

EXETER.

W. S. McLaughlin.

23 Dec. 1863.

19,715. Are the banks muddy ?—At the high part of the bank, but at the lower it is sand.

19,716. Has the mud increased ?—No, it has decreased, there is more sand.

19,717. Has there been any difference in the number of different kinds of fish ; has there been a decrease in one kind more than in another ?—I think not.

19,718. There has been a decrease ?—Yes ; about 20 years ago I could catch a cwt. in a day's fishing.

19,719. Has it decreased very much ?—Now I cannot catch 100 fish in a day.

19,720. Have sprats decreased ?—There has not been a London sprat in the river for many years, but the river has been full of herring sprats.

19,721. Do not the real sprats come into the river now ?—No ; they have not been here for eight or ten years I think.

19,722. Do you mean to say that the sprats in the dish are all young herrings ?—There are no London sprats.

19,723. Has there been no sprat-fishing here in the river lately ?—No, but at Teignmouth they have got a great quantity of sprats. They come into our river only very seldom.

19,724. Then the sprats we have heard of are mostly young herrings ?—Yes, I do not remember sprats here more than two or three times in our river for the last 30 years. I have seen as much as one hundred tons brought ashore where I used to live in one day.

19,725. Do the herrings spawn in the river within the bar ?—Yes, all up and down the river.

19,726. Do they come in as great quantities as they did formerly ?—I think they do.

19,727. Do you think there are more herrings caught now than were caught formerly ?—Yes, because there are more people to catch them.

19,728. Are there still great quantities of young herrings caught ?—Yes, our river was full of young herrings, all the last season.

19,729. How many men were engaged in taking them ?—When the herring sets in, the seine herring men here stop at home as well, but if there are no fish to catch they are off to sea again.

19,730. Do they catch full sized herrings with the seine net in the river ?—Yes, and the young herrings too.

19,731. Do the mackerel come much within the bar ?—They come close to the bar but not into the river.

19,732. Do you catch them off the bar ?—Yes, they are a sea fish.

19,733. Do you think that there has been any diminution in them ?—Not in the least.

19,734. Has there been an increase ?—I fancy there has been. We see plenty off the shore, but they won't take the hook, and they do not come near enough to the shore to be struck with the seine.

19,735. Are there any seine nets used about Dawlish and along the coast ?—Yes, the number has increased within the last 10 years.

19,736. Do you think the young mackerel come up the river here ?—No.

19,737. You have never caught any ?—I have seen a few but nothing to speak of. It is a rare thing for mackerel to come into the river.

19,738. What number of seines are used at Dawlish and along the coast for catching mackerel ?—There are three or four at Dawlish, and perhaps 10 at Teignmouth.

19,739. Do they catch much mackerel ?—Sometimes.

19,740. Do you think the supply has increased ?—Yes, because we have more nets now, and better nets too.

19,741. Do they send off their fish by railway ?—Yes, to all parts.

19,742. (*Professor Huxley.*) Do you get the full-sized herring in the river here ?—Yes.

19,743. Is the full-sized herring you get here as large as those caught at Yarmouth ?—Yes.

19,744. Is it the same fish ?—Yes.

19,745. Do you get a small kind of herring here ?—Yes, the same as you saw to-day.

19,746. They are all young fish ?—We get them from that size up to full-grown fish.

19,747. Do you get a full herring smaller than the common size ?—We get them of all sizes.

19,748. You know what a full fish is ?—Yes, full-roed.

19,749. Have you ever found in the river here a full-roed fish much smaller than the ordinary full-roed fish ?—Yes, I think so. If we find the fish in the sea, we generally find that we have the same in the river.

19,750. Have you ever heard your fishermen here say that they have caught any kind of herring different from the ordinary sea herring ?—No, it is always the same fish. When they strike the coast, they strike the river.

19,751. When do you fish for them ?—Generally from Michaelmas to Christmas.

19,752. When are they full of spawn ?—November is the best month.

19,753. Do you get them full in January ?—No, they are going off fast now.

19,754. Are they shotten now ?—Yes, a great many of them.

19,755. You were speaking just now of the seining here ?—Yes.

19,756. Do you catch them with drift nets ?—Yes, mine are drift nets.

19,757. Do you set them here ?—No, outside the bar. In the river they are caught with the seine.

19,758. Do you consider that it is one and the same fish that you get at both places ?—Yes.

19,759. Has there been much seining for herrings in the river for many years past ?—Yes, there always has been.

19,760. And of herring sprats ?—Yes.

19,761. Is there a large quantity taken off here ?—Yes, of London sprats. I have seen 100 tons of London sprats at once.

19,762. Is any large quantity of herring sprats taken ?—No, they do not catch them if they can possibly prevent it. They think it better to let them come to perfection, but in hauling up the seines they kill a lot.

19,763. You do not think that for the last four or five years many London sprats have been caught here?—No.

19,764. But you have caught small herrings ?—Yes, in the mesh there are small herrings that come with the larger ones. They draw them into the boat altogether.

19,765. (*Mr. Lefevre.*) You do not fish purposely for the small herrings ?—No. If they thought they were going to catch nothing but herring sprats, they would not go out to catch them at all.

19,766. You say that when you were a boy you fished with the line ?—Yes.

19,767. What did you catch ?—Flounders, plaice, turbot, cod, halibut, and other fish.

19,768. Have you observed a diminution in all these kinds of fish ?—Yes.

19,769. What paid the best ?—Flounders. I have caught in my days hundredweights of flounders, and a few bass, eels, and cod. There was a large quantity of eels.

19,770. Do you catch them now ?—They catch them very small indeed.

19,771. You have not observed any diminution in the herring or mackerel ?—No, because they are sea fish.

The witness withdrew.

EXETER.

J. Challis.

23 Dec. 1863.

JOHN CHALLIS called and examined.

19,772. (*Professor Huxley.*) Are you a fisherman?—Yes.

19,773. You are engaged in fishing in the river here?—Yes.

19,774. Of what place are you a native?—I belong to Lympstone.

19,775. What kinds of fishing have you practised there?—All sorts of fishing.

19,776. How many years have you been engaged in fishing?—For the last 30 years.

19,777. When you first began to fish how many boats went out from Lympstone?—Just about the same as now.

19,778. There has been no increase or diminution?—There may be one more now.

19,779. There is now only one more than there was when you commenced fishing?—Only one more.

19,780. Is that engaged in seining?—Yes, there is one more seine.

19,781. What was the total number of people employed in the fishing when you began 30 years ago?—About 30.

19,782. How many are there now?—Somewhere about the same number.

19,783. Has the supply of fish which these persons catch very much fallen off of late years?—The flounders have fallen off.

19,784. Has there been any falling off in the other kinds of fish?—I do not think there has been. Sometimes we have had less herrings, but the herrings when they come in come in in a bulk. It is the flounders that have fallen off most.

19,785. In former years was there a large supply of flounders here?—Yes, we have had very large takes.

19,786. How were they taken then?—They were taken by the hook mostly.

19,787. Did you use the seine then?—Not so much as it has been used since. The small fluke seine we used with a herring scale.

19,788. The size of the mesh was the same as the mesh of the herring net?—Yes, it was a large seine. At that time there were very few small fish destroyed. When we had a take we sorted out the small and put them back into the water. They do not take as much trouble now-a-days as we did then.

19,789. Were you in the habit of seining for herrings every season?—Yes.

19,790. Did you take a considerable quantity of small fish in that way?—Yes.

19,791. Have you found that that has diminished the number of herrings you can obtain every year?—The herring is a very uncertain kind of fish. Sometimes you will not get any and sometimes they are very plentiful.

19,792. Suppose that you take a great quantity of herrings in your seines one year, do you find that you get fewer herrings the next year?—No, but one year they may be very plentiful and the next year we may have none.

19,793. You do not find that the quantity you take in your seines in the course of one season's fishing causes any diminution in the quantity you catch another year?—Not at all.

19,794. Then, in your opinion, the use of the seine-net does no harm to the herring-fishing?—Not at all.

19,795. Are the fish that are caught in that way much bruised?—No.

19,796. How do you work the seine?—We land with one end on the banks of the river and shoot the nets round.

19,797. Do you land again with the other end?—Yes, we land again and haul the net in.

19,798. You drag the fish on shore?—Yes.

19,799. You do not work the net as a circle net?—Yes we do; it is a circle net.

19,800. Tuck-net fishing is pulling a net round the fish and lading them out into the boat, not dragging them on shore. You drag all your fish on shore?—Yes.

19,801. Do you find that in doing that the fish ever become injured or damaged in any way?—No; no harm comes to them.

19,802. Have you a good market here for your fish?—Yes.

19,803. Do you practise that mode of fishing, namely, seining, a good deal here?—Yes.

19,804. Do you ever find that when you draw in your nets there is any considerable mixture of other fish with them?—Yes, there may be at times.

19,805. What sort of fish do you find mixed up with them?—Various kinds. Sometimes there are a few small pollacks no longer than my finger.

19,806. Do you ever catch any small turbots with the herrings?—Sometimes.

19,807. Any small flounders?—Yes.

19,808. And plaice?—Yes, sometimes we get very small plaice.

19,809. I suppose that you get a considerable quantity of small fish sometimes?—Yes.

19,810. Would it interfere with you much in your trade if you were bound to pick out these small plaice and flounders, and return them to the water?—That would be very difficult when the herring season is on. The herring season sets in in September, and it generally lasts until January. After that is over I think there ought to be a larger scale used for flounders. They would not catch any small fish then.

19,811. You think if a larger scale was used no injury would be done to the small fish?—Yes.

19,812. A suggestion has been made here by one of the witnesses, that if persons engaged in fishing take fish, such as flounders and the like, of too small a size, they should be fined for so doing. I wish to know whether the carrying out of that regulation would be any hardship to you as a practical fisherman?—No, I think not.

19,813. If any officer were to come down upon you and say: "You have got a great quantity of "small fish here, I must have you fined" would you consider that a hardship?—No, I think it would be a benefit to us if it were done in a proper manner.

19,814. Do you think that the clearing out of these small fish would take a great deal of time?—Well, if we were obliged to do it, it would be done. We should all be compelled to do it.

19,815. Do you think that the time taken up would interfere seriously with your occupation?—It would take a little longer of course.

19,816. But it would not interfere seriously with you?—I think after a little time we should obtain a benefit because the fish would be a great deal larger.

19,817. But suppose that nothing but the herring fishing is dealt with, do you think that the trouble of picking out the small fish would be so great that it would interfere seriously with your trade?—No, because most of us catch herrings a long way down, and most of the flounders are caught up the river. We do not catch a great many flounders with the herrings. It is along the flats and about the lakes that they are caught.

19,818. Then you do not think it would interfere with your interests?—No.

19,819. Do you agree with what you have heard stated to us as to the falling off in the supply of fish in general, apart from the sprats?—There are not a quarter as many flounders as there used to be, and those that we do get are very small indeed.

19,820. Do you ascribe that to catching the young fish?—Yes.

19,821. Do you think that could be obviated by making the mesh larger?—Yes, after the herring season is over, or unless a shoal of sprats comes in. The London sprats sometimes come in, and then we are obliged to have a mesh according. I have a sprat bunt now, but I do not use it unless the sprats come in the river.

19,822. (*Mr. Lefevre.*) Do you recollect the time when the fishermen threw back the small fish?—Yes, a great deal more than they do now.

19,823. Why do they not do it now?—I don't know.

19,824. Do they sell the small fish more than they did?—They sell what they can.

19,825. Was there no trade for it formerly?—People would not have it when they could get larger fish.

19,826. Then you could not sell small fish at all then?—No, because there were plenty of large fish.

19,827. But you can now?—The fishermen cannot get any others, and they get what they can for that.

19,828. Do you never catch the large flounders at all now?—No, they are all small.

19,829. Do they not live long enough to become large?—There are a few, but they are a very small quantity.

19,830. Does it pay you to catch the small flounders?—No, I have not been out hooking for 10 years.

19,831. Are flounders caught by the hook?—Yes.

19,832. Does it answer to use a seine for these small fish?—I only go out seining for herrings.

19,833. You do not catch a very large number of small fish then?—There are not many flounders where we get the herrings. When the herrings strike in the flounders are higher up the river.

19,834. You do not practise seine-fishing higher up the river?—No, that is done by the small seines which go from January all the year round when the herrings are all over.

19,835. Are they made like your seines?—Yes, they are just as deep, but have a smaller scale.

19,836. You do not use a net of that description yourself?—No, I have not got one.

19,837. Is there any one here who does use it?—Not that I know of. There are no Topsham men here. There were two, but they have gone away. I believe that the Topsham herring men do not hold with the small nets.

19,838. If they cannot sell the small fish they catch for anything, why do they go out fishing for them?—They do sell them, but they make very little by them. People do not buy them for eating. They have been carried over to Salterton to bait the lobster pots with.

19,839. How many men are engaged in fishing with these fluke nets?—A dozen at Topsham.

19,840. Do they catch large fish at times?—A few, but they catch nearly all small.

19,841. They do not catch enough large flounders to make it pay?—I do not think they do.

19,842. Do they sell the small flounders?—They sell what they can, but people will not buy them except to take to Salterton for baiting the crab pots.

19,843. Is there a large demand for small fish for that purpose?—At times there is.

19,844. Are there about a dozen men employed in that trade?—Yes, but there are not a dozen fluke seines. There are only about half a dozen.

19,845. Does it require two men to work each net?—It takes two and three, or four sometimes.

19,846. (*Professor Huxley.*) As I understand you, the people of Lympstone are doing about as well as they used to do when you first knew the place?—About the same.

19,847. Only instead of fishing in one way they fish in another?—Yes.

19,848. (*Mr. Lefevre.*) None of the regulations suggested to us to-day would affect you at all?—Not at all, they would rather benefit us than otherwise; I believe they would benefit all.

19,849. You do not fish for the small fish?—No. What is the use of catching them.

19,850. But there are men who are engaged in fishing for these small flounders in order to sell them?—Yes, they may have a few large ones, but the greatest part is small. Sometimes they gave them to the pigs, and at others they take them to Salterton for baiting the crab pots. As to oysters, I have been in the habit of having from 500 to 600 tons from Falmouth in the course of a season.

19,851. Do you agree with the other witnesses that the brood of oysters has fallen off?—Yes, because the men dredge up everything. The oysters have fallen off on the French coast, and now the Frenchmen flock into Falmouth harbour, and they, together with the London merchants, are taking away an enormous quantity. They are dredging up everything.

19,852. Have you any allotment of an oyster bank yourself?—I have an oyster bed at Lympstone.

19,853. Have you given up laying down oysters there?—I have about 50 tubs left.

19,854. Do you recollect the time when there were a great number of oysters indigenous in the river?—I recollect when there were a great deal more than there are now. That was because, as Mr. Drew has stated, the Earl of Devon interfered then. Since it has been made a free river, anyone can dredge in it, and there is nobody to interfere.

19,855. How long is it since it was made a free river?—Since there was a trial carried on here.

19,856. Since then there has been no protection?—No, it is now a free river like at Falmouth.

19,857. Do you wish to see any regulations enforced as to the number of men who shall be allowed to dredge in the river?—At that time none of our side were allowed to dredge on the Starcross side.

19,858. Would it be a benefit to you if you were allowed to dredge there?—No.

19,859. Were you in the habit of buying small oysters that were dredged from the bottom of the river?—They did not take small oysters then. They threw them overboard to breed from. Now all are taken up, and nothing is left but the sand. They have left some in Falmouth Harbour, but I cannot buy an oyster there now. They are now getting from 11*s.* to 14*s.* a tub for them, and they cannot get a tub a day where they used to get 10, 12, and 14 tubs.

19,860. Would you like to see any regulation carried out as to the size at which the oysters shall be taken?—Yes; the small oysters ought to be allowed to remain. There were 50,000 tubs taken out of Falmouth Harbour about three years ago.

The witness withdrew.

EDWARD SEARLE called and examined.

19,861. (*Professor Huxley.*) Are you a fisherman at Starcross?—Yes.

19,862. How many years have you been a fisherman there?—I have been a fisherman there for nearly 50 years.

19,863. What kinds of fishing have you practised?—I have been seining a little. That is the last fishing I have been at.

19,864. Have you been a hooker then?—I have been seining for 15 years, but I have also been hook-fishing, and drifting for herrings, shell-fishing, and dredging for oysters.

19,865. Do you not seine for herrings?—Yes.

19,866. But do you not seine for other fish?—We seine for herrings and we drift for herrings too.

19,867. What was the number of fishermen at Starcross when you first knew the place 50 years ago?—There were four large seines that belonged to the place then.

19,868. How many fishermen were there?—There were eight men to each net.

19,869. That would be 32 altogether?—Yes, but they were not confined to that sort of fishing.

19,870. What did they do besides?—At times they went to sea.

19,871. How many people were there who got their livelihood altogether from the fishing?—20 or 30.

19,872. Twenty or thirty got their living wholly and solely by fishing?—Yes, in the winter time.

EXETER.

E. Searle.

23 Dec. 1863.

19,873. How many are there now ?—At this time there are but very few. There are not more than four or five ; perhaps there may be five or six, taking the shell-fishing and everything.

19,874. How has that come about ?—The river has altered a great deal.

19,875. The river has altered ?—Yes.

19,876. In what way ?—It has filled up with sand. Where there used to be good land for oysters, good plain ground free from dirt and sand, it is now filled up. The people, since I can recollect, used to go dredging on the Earl of Devon's rights. They dredged for oysters. The large ones they caught they took to the market, and the small ones they threw back again.

19,877. Have you ever been engaged in oyster dredging ?—Yes, I have been out 20 years ago.

19,878. What did you catch then ?—I have got as much as two boats in a day of good large oysters, and there were no fellows to them in England as to their flavour.

19,879. That fishing has come to an end now ?—Yes. Where there is any ground now for the oysters to breed upon the fishermen go and take up the small oysters as well as the large ones. They would not take them up unless they were as large as the palm of your hand when I went a fishing, not before they got a certain age and became pretty thick.

19,880. Do they take them much less now ?—Yes, very much less. They take them up now when they are only as large as a five-shilling piece, and it is that that injures the breed. But the filling up of the river has also had a good deal to do with it. In places where I have been dredging years ago, where I have got from seven to eight or ten bushels, there is now seven or eight feet of sand.

19,881. How is it that the fishermen now are permitted to take the oysters up at all times of the year ?—Because there is nobody to look after the fishing.

19,882. But are you not aware that that is against the law ?—Yes. There used to be a water bailiff at Starcross.

19,883. (*Mr. Lefevre.*) Are you speaking now of that part of the river over which Lord Devon claims jurisdiction ?—Yes. We used to be bound to go dredging then at particular times. The boats were only allowed to go in at certain times, and we had to come in at such a time in the evening. Two days a week only were allowed to us from Michaelmas to Christmas.

19,884. Was the fishing open to all the fishermen about here ?—No, only to the people who belonged to Kenton manor.

19,885. You were only allowed to fish for two days a week ?—Yes, only on the two first days in the week. If we could not go out on those days, they would not let us go out on the two days afterwards in order to make it up. We were obliged to go out at stated times, and according to what we got they took out some of the best oysters as an acknowledgment. If we took any of the small ones they seized them and put them back again. At these times the people here could catch oysters.

19,886. (*Professor Huxley.*) Were you also engaged in hooking at that time?—I have been hooking off and on from the time I was nine years of age.

19,887. Did you ever catch many fish with the hook ?—Yes, a good many fish were caught by the hook 40 years ago.

19,888. What kind of fish ?—There were plenty of fine flounders and plaice then.

19,889. Can you catch any quantity now ?—You may go out from morning to night and not catch six-pen'orth.

19,890. What is the reason of that falling off ?—There are so many seines now. We have 25 or 30 of them dredging all over the mud. They put a boy out, go round, and draw in the net, getting everything there is, eels, and anything else they can get. They put out boys, generally youngsters, who will not work for their living, and they rob me and other men who have to work hard. They go round in a circle with the net. Then they land and they haul the net ashore taking everything that is in it, and they sweep everything clean out of the river.

19,891. (*Mr. Lefevre.*) Are you talking now of the seine fishing higher up the river, at Topsham ?—Yes. There is not so much mud where they go fishing in the lower part of the river.

19,892. (*Professor Huxley.*) Were there no seines when you begun fishing, when you were a boy ?—Yes, there were seines long before my time.

19,893. Were there as many then as there are now ?—I don't know.

19,894. Have you noticed much difference in that respect ?—There are a great many more herring nets.

19,895. Did they work the seines more carefully when you were a youngster ?—Yes ; I have seen them when they have only had half a maund of fish drop all the young fish into the water again. Instead of doing that now they drop them out for the birds to eat.

19,896. Do you think that the decrease which has taken place in the quantity of fish you can catch is owing to the wasteful mode of fishing practised ?—Yes, I certainly do.

19,897. Do you think that if the small fish were put back into the water as they were formerly, the fishing would be restored ?—Yes. It is the small seines that commit the destruction. They sweep in everything.

19,898. Do the big seines commit as much destruction ?—No.

19,899. Do they very rarely catch small fish ?—Yes, they rarely catch a fluke at all. I weighed some of the fish they catch in the large seines, and after they have been cleaned they have weighed 5 lbs. apiece.

19,900. Do you ever go spratting ?—No, I have not been spratting. We have no seines in our place for that.

19,901. Did you hear the evidence of Mr. Kingdon ?—Yes.

19,902. Do you agree with it generally ?—Yes.

19,903. You are of opinion that the views he expressed are the views of the fishermen generally ?—Yes.

19,904. (*Mr. Lefevre.*) Is the diminution you speak of in the fish principally confined to flounders ?—Yes, except sometimes when there are a very few mackerel.

19,905. You spoke of a general decrease in the number of fish ?—Yes.

19,906. Is that merely in flounders and plaice ?—Yes, the flounders and plaice do not strike our river.

19,907. In what other fish have you observed a falling off ?—In flounders the falling off has been wonderful.

19,908. But what other fish have fallen off ?—I don't know that there is any other fish in particular. There is nothing except the river fish. It is mostly the river fish.

19,909. Do you agree with the last witness that there has been any diminution in the herrings caught here ?—I don't think there has been any difference in the herrings.

19,910. Or in the mackerel ?—No ; we may catch plenty some days, and then we get none.

19,911. Do you go out fishing off the bar ?—Yes, in the summer time.

19,912. Have you observed any decrease in the fish you get there ?—No. For one hour or two hours we may haul in as fast as we like, and then they go away and we catch none. It is the same with the herrings.

The witness withdrew.

T. Danning.

THOMAS DANNING called and examined.

19,913. (*Professor Huxley.*) Are you a fisherman ?—Yes.

19,914. Are you engaged in fishing from any of the villages about here ?—Yes, from Lympstone.

EXETER.

T. Danning.

23 Dec. 1863

19,915. How many years have you been a fisherman there?—About 40 years.

19,916. Do you agree with what you have heard stated here to-day?—Yes.

19,917. As to the falling off in the quantity of fish you are able to catch?—Yes.

19,918. And do you agree with the previous witnesses as to the cause of that falling off?—Yes.

19,919. Is there anything we have omitted to inquire into upon which you can give us any additional information?—Not in the least.

19,920. Do you think we have had a pretty fair case laid before us?—Yes, you could not have a better.

The witness withdrew.

FREDERICK JOHN WALKER called and examined.

F. J. Walker.

19,921. (*Professor Huxley.*) You are living in this neighbourhood, I believe?—Yes.

19,922. How many years have you resided here?—I have been living here about 12 years, and I have been in the habit of spending from six weeks to two months in the year down at Teignmouth, boating, yachting, and fishing. I have been on the water from six to seven hours a day.

19,923. Have you taken any interest in the fishing in the river?—Only in the salmon fishery; I am one of the conservators.

19,924. Have you taken no interest in the other fisheries?—I have been fishing a great deal at times.

19,925. Have you noticed any falling off in the quantity of fish taken?—What sort of fishing?

19,926. I speak particularly of flounders?—I do not know much of the fishing in the estuary of the Exe, but I am acquainted with the fishing in the neighbourhood of Babbicombe Bay, Teignmouth, and that neighbourhood.

19,927. We have already inquired into the condition of the fishery at Torbay, but we should be glad to hear anything you can say in reference to Teignmouth.—A remark has been made with regard to the number of seines used. 12 years ago there were not more than one or two seines used.

19,928. At Teignmouth?—Yes.

19,929. How many are there now?—There will now be 15 or 16, but they are not only much larger boats, but they adopt a different principle of dredging. They now attach three or four ropes, shoot the seines out much further, and haul them to the shore.

19,930. Do the seines they use have a pocket?—No, a new system of seining has been introduced during the last two years; they drag out the nets much further; they attach ropes to the two ends and get all the fish in deep water. Some years ago we used to go out, and we could catch a basket of dabs and flounders in a day. Frequently you might have seen as many as 30 or 40 boats out, but that is not the case now. I have not seen three boats out this year, and those that do go seldom catch anything now.

19,931. Do they still contrive to catch a good deal of fish by using the seine?—Not dabs and flounders.

19,932. Then, in your opinion, has the excessive seining which takes place along the shore caused the same falling off in the quantity of fish as that which is complained of here?—Yes, I think so. There is one remark I should like to make in reference to the mackerel. This year, on account of the smallness of the mesh of the seines, they have been destroying, to an enormous amount, the small mackerel, what are called locally "joeys."

19,933. (*Mr. Lefevre.*) Does the destruction you speak of go on at Teignmouth?—Yes, and in the whole of the neighbourhood all round from Langton Point to Babbicombe Bay. In one boat, according to a calculation we made, there were 20,000 of these young fish. They brought them in and offered to sell them for 6*d.* a hundred, whereas the large mackerel are worth 8*s.* a hundred. Some of the fishermen send them, I believe, to Bridgewater for sale, but being so tender, and being shovelled about, they are much injured before they arrive at their destination, and are altogether unfit for food.

19,934. (*Professor Huxley.*) But if there is no sale for fish of that description surely the process is not likely to be repeated?—Notwithstanding the circumstances I have mentioned the catching of these small fish went on day after day, and a very large quantity of young mackerel were taken and destroyed. Now, if the nets used by the fishermen had a larger mesh, the small fish would have escaped and only the large ones would have been caught. But for the sake of taking 200 or 300 full-sized fish these men destroy at least 20,000 or 30,000 small fish that are of no use to anybody.

19,935. Do you think that did a great injury to the fisheries generally?—I have no doubt that if the same destructive mode of fishing is allowed to continue it will do very great injury to the fisheries eventually. At present there has not been sufficient time to allow the evil to be felt. The system only began very recently.

19,936. (*Mr. Lefevre.*) How long is it since it commenced?—Only three or four years at the outside.

19,937. During that time have you noticed any great diminution in the take of mackerel?—I cannot say that I have noticed any decrease in the take generally as yet. Although the system has been practised for three or four years it has not been so extensively carried out, and so many small fish been taken, as during this last year. It is hardly possible, therefore, for the system to have been in operation a sufficient length of time to enable its injurious effects to become apparent. You may judge, however, for yourself what the result is likely to be when I tell you that it was not one boat alone that had 20,000 or 30,000 of these small fish, but that there might be 10 boats following the same course of fishing at the same time, each of which would bring in that number in one day.

19,938. Then, in speaking of this mode of fishing as injurious and destructive, you speak of the future rather than of the past?—Yes.

19,939. Do the mackerel go up the estuary at Teignmouth?—I have seen them caught in the harbour there.

19,940. At the mouth of the harbour or far up the estuary?—Not far up; not more than 200 yards. I believe, however, that they have been caught as far up as the bridge.

19,941. Are these mackerel seines used for catching flounders or only for mackerel-fishing?—There are no flounders caught there now.

19,942. Do you not catch the small flounders?—No, I have not seen a net drawn for them.

19,943. Has the flounder deserted the place altogether?—I suppose it has, and I believe that that is the reason they do not draw for it. You can bring up nothing but dog-fish now.

19,944. Are there as many as 15 seines used for mackerel?—I think there as many as that used.

The witness withdrew.

SCOBLE WILLESFORD recalled.

S. Willesford.

19,945. (*Mr. Lefevre.*) You wish to add something to your evidence in reference to the mackerel?—I only wish to say that the mackerel do not go up the Exe for the purpose of breeding. They are seen up the river at times, but only when there is a glut of them on the bar or outside. Perhaps they may have

EXETER.

S. Willesford.

23 Dec. 1863.

been pursued by dog-fish or other enemies. But, in my opinion, they never go into the river of their own accord. It is not a breeding place for mackerel.

19,946. Are young mackerel not found in the harbour at all?—No, they are found outside. They are a sea fish. They do not breed in the river at all.

19,947. Then may we not take it that the use of the seine net in the Exe and the Teign really does harm to the river fish, and not to the sea fish?—Pardon me, there is a great destruction of our best fish, such as soles and turbot, which come in for the purpose of breeding. They are ground-fish, and they come in close to the shore. These men catch thousands of turbots, soles, and brill of a very small size.

19,948. Have you ever caught large soles and turbot in the estuary of the Exe?—Yes, sometimes a foot in length.

The witness withdrew.

J. C. Wilcocks.

JAMES CARROL WILCOCKS called and examined.

19,949. (*Professor Huxley.*) You are one of the conservators of the river?—Yes.

19,950. You wish to make some statement to us as to the fisheries, I believe?—I only wish to corroborate what has been stated by Captain Kingdon in reference to the Coastguard service. I believe they might be made very effective for the preservation of the fish. I believe there are great complaints at present as to the manner in which the Topsham men fish. I hope the small seines they now use will be done away with entirely, because when they are used they not only take in the small dabs and flukes, and so forth, but all sorts of fish that are in the river. I have watched them frequently, and I have seen them out—two men and a boy—with a boat, when the tide is down low. They go down the river and cross it. One man and a boy remain in the boat, and the other lands with one end of the net. The boat then goes down the river for a quarter of a mile, or perhaps only half of that distance, according to the weight of the net. They turn the boat round, throw a rope ashore, and pull in gradually until they land all the fish they have got. They actually scour the river. Nothing escapes them. I have seen them draw up a very large quantity of fish—from a peck to half a bushel—of every description of fish that can be found from Portland down to Berry Head. I have already given evidence to this effect before Mr. Eden, the Commissioner, when he was here. He said that further inquiry should be made into the matter. If the mode of fishing now adopted is not soon put a stop to, I believe that the fine fisheries we have all round here from Torbay will be very materially injured.

19,951. In point of fact, you concur in the general tenor of the evidence we have already had to-day?—Yes.

19,952. (*Mr. Lefevre.*) Do you think there has been any diminution in the take of fish outside the bar here?—That is a point upon which I am not competent to speak.

19,953. Have you yourself ever been out fishing?—Yes, I have been out trawling, and I know the way in which it is managed. The practice, when I have been out, has been to draw the net up to the mast; the cod of the net was then taken on deck, and down all the fish would fall upon the deck. One man stood on the left and another on the right; one would throw all the good fish into his basket, and the other would shovel all the small fish overboard.

19,954. Is there anything else you wish to say to us?—There is one thing which I think has not been named to you in reference to trawling. I think that no trawling should be allowed to be carried on within a certain limit of the shore. They should not be permitted to come into any place where the water is shallow, because when they do they take up all the small fish, which are generally found in shallow water, and they do great injury.

19,955. How far do you think they ought to be kept from the shore?—In my opinion they ought not to be allowed to trawl within a mile or more of the shore.

19,956. You cannot say, from your own knowledge, whether there has been any diminution in the quantity of fish caught by the trawlers?—No, I cannot, but I believe it has decreased.

19,957. Do you think the number of fish caught both in shallow water and in the estuary here has decreased?—Yes, I have no doubt of it.

19,958. Has there been any increase or diminution in the price of the fish?—The price of fish has more than doubled within a very few years indeed. For instance, fish are sometimes so dear in Exeter that it is a constant habit to send to London for a supply, and have them sent down by rail.

19,959. (*Professor Huxley.*) Do you agree with Captain Kingdon that there is a considerable quantity of fish sent up to Exeter in that way?—Yes, it may be brought to Exeter cheaper from London, Bath, and Bristol than it can be got in Exeter itself.

19,960. There are many places which, in consequence of the facilities the railway affords them, now send up their fish to London and other large towns. You do not consider that that is the case here?—No; this place is inland itself and there is no market to which it could be sent where it would realize a better price.

19,961. (*Mr. Lefevre.*) Do the Topsham men fish mainly for small flounders and small plaice?—Yes, many of them. They use the herring net also.

19,962. In consequence of fishing high up the river they mainly catch small fish?—Yes, and they catch the graveling and salmon trout.

19,963. Do they fish mainly for small fish?—Everything they can catch they bring in. A great deal of the small fish brought in by the Topsham men is got rid of by the women. There is a public-house where you can see the women come with their baskets, and in those baskets they have all descriptions of fish.

19,964. Do you agree with the previous witnesses that it is mainly small fish these men catch?—I believe that they catch an immensity of small fish; of course they do not go out to fish solely for small fish; they go out to catch as large as they can. The very small fish they turn out on the shore where they perish. They must destroy from 100 to 150 tons weight of that small fish in the course of 12 months. If it had been allowed to live, in three years time it would have made 20 times as much.

19,965. Do they not sell these small fish?—They sell as much of it as they can.

19,966. Can you form any opinion as to the quantity they sell?—No; I cannot form any opinion.

19,967. Do you agree with a previous witness that a considerable number are sold for baiting the crab-pots?—Yes, I have no doubt they are, and likewise for bait for other purposes.

19,968. Are they also sold to the poor?—It is only the poor who buy them; but I believe if these nets are not done away with the law in reference to salmon will be much injured. I agree with Captain Kingdon as to the migration of the smolt or the small salmon, "graveling" as we term them. They meet together like the swallows, and before they go to the sea they congregate in particular places in the river.

19,969. Is it not illegal now to take the smolt?—Yes, it is illegal, and we have recently convicted some of the Topsham men.

19,970. (*Professor Huxley.*) Is it the practice to lay down the native oysters here?—We have two sorts of oysters; the dredge oyster and the Falmouth oyster. The Falmouth oyster is very copperas, but our river is an excellent place for breeding oysters

and for the spawning of oysters brought here. I have no doubt if the beds had been protected properly immense quantities of oysters would have bred here, and an excellent business might have been made out of it. I am confident of that, and I think I shall be borne out by other people here.

The witness withdrew.

JOHN EYRE KINGDON recalled.

19,971. (*Professor Huxley.*) Can you tell us anything in respect of the crabs and lobsters here?—We do not get anything like the number of crabs and lobsters we used to get.

The witness withdrew.

HENRY SAMUEL ELLIS called and examined.

19,972. (*Professor Huxley.*) Are you a resident here?—Yes, I reside here.

19,973. Have you been here many years?—Yes, all my life.

19,974. Have you taken great interest in the fisheries here?—I have in this way: About 12 months ago I took considerable trouble to obtain information respecting the oyster, mussel, and cockle fisheries of the Exe. I read a paper upon the subject at our Natural History Club, but the greatest portion of the information I collected has already been repeated here. I learned that there were many oyster dealers and merchants on the Lympstone side who were in the habit of getting oysters from Falmouth and laying them down in the river Exe. I also ascertained that although great care was taken by the Custom House officers in seeing that the oysters brought up were properly laid down there was no care exercised in seeing that they were not removed in the close season. I learned that during the close season tons of oysters were sent to London and other parts of England. I can positively state that 19 tons were sent away in the month of July 1862 from the town of Lympstone.

19,975. Were they taken from the oyster parks?—Yes, they were the Falmouth oysters which had been laid down recently before.

19,976. Were the oysters you speak of within the tide marks?—Yes, they were oysters laid down for the purpose of being fed, and to have their coppery character removed.

19,977. Have you any evidence that oysters breed there?—I have come to the conclusion that the Falmouth oysters never breed there. I had a quantity of oysters submitted to me by Mr. Saunders, an oyster dealer and fishmonger in this town during the year 1862. As late as October, November, and December, I have had oysters in spawn given to me for examination with the microscope. I think that as many as one in every 30 or 40 oysters on some occasions have been found full of spawn.

19,978. What oysters were they?—From Falmouth.

19,979. From Falmouth direct?—No, they came from Lympstone to me.

19,980. How long had they been at Lympstone?—They require to be there a year in order that they may lose their coppery colour.

19,981. The oysters you examined had been on the Lympstone beds for a year?—They had, as far as I could judge from their having lost their coppery appearance.

19,982. Did they continue spawning?—They were full of spawn in the months of November and December. They were in spawn in that year unusually late.

19,983. (*Mr. Lefevre.*) I suppose that the oysters from Falmouth are never laid down in the bed of the river below low-water mark?—I think not. If you examine the beds at Lympstone, I should say they are not such as oysters would breed in.

19,984. Has anyone tried the experiment of laying them down below low-water mark to see if they would breed?—I believe it has never been tried. I believe the oyster, in the bight where they do breed, is a different oyster. Those I have examined I have found quite different from the Falmouth oysters which are laid down in the river.

19,985. (*Professor Huxley.*) Different in what respect? In shape?—Yes, in shape and in thickness. Those which attain any age in the bight have a thick shell—a flat thick shell.

19,986. The oysters you had from the artificial beds here were full of spawn?—Yes, in the month of November.

19,987. On what ground do you base the conclusion that they do not breed there?—I cannot find any young oysters.

19,988. Do you think the spawn comes to nothing?—I think it is entirely wasted.

19,989. They come to a certain ripeness, and are then wasted?—Yes; at a certain season I have found all the oysters full of spawn on the beds at Lympstone, but the whole has been wasted.

19,990. (*Mr. Lefevre.*) Is that on account of being placed on beds where they will not breed?—The water retires and leaves them exposed.

19,991. And exposed to the frost?—Yes; great care is taken that they shall be laid down. The Coastguard officers report that the oysters brought from Falmouth have been laid down on the beds. I think it is very important when such care is taken that they shall be laid down properly, that similar care should be exercised in seeing that they are not removed again. At present there is nothing to prevent their being laid down one week and removed another. They are brought in boats from Falmouth.

19,992. They are private property?—Yes.

19,993. Then are not the owners the best judges when they should be sold?—But I understand there is a law which absolutely prohibits their being removed.

19,994. (*Professor Huxley.*) There is a regulation against fishing oysters in a certain season?—Yes.

19,995. (*Mr. Lefevre.*) But there is no law against their being sold when they become private?—No. In October, November, and December they are full of spawn.

19,995. If they are unfit for eating when they are taken they would not fetch any price?—For what reason they are taken up and sent away I cannot say. They may be sent to London to be laid down on other beds. I have been informed by the railway company that in July 1862 19 tons were sent to London, and that they have been sent away in other seasons in the same proportion. The quantity has lately decreased in consequence of not being able to get them from Falmouth, and therefore very few have been laid down.

19,997. Are you of opinion that the oysters were unfit for food?—I have not come to any conclusion on that point.

19,998. (*Professor Huxley.*) When you speak of finding spawn was the spawn in the body of the oyster or between the two valves of the shell; between the mantle lobes?—It was full of spawn, mostly white, but some of it was black.

19,999. Was it between the mantle lobes, not in the body?—Yes.

20,000–1. The spawn had been laid and had passed out of the body of the oyster between the lobes of the mantle?—Yes.

20,002. Did you see embryo oysters in the eggs?—Yes, they were moving about.

EXETER.

H. S. Ellis.

23 Dec. 1863.

20,003. They were impregnated ova?—Yes.

20,004. It is not the fault of the brood or of the oyster, but of the subsequent exposure which destroys the embryo?—Yes. I had drawings made which I shall be happy to submit to you.

20,005. (*Mr. Lefevre.*) Has there been a great falling off in the oysters since Lord Devon ceased to exercise any control over the beds?—From information I have received from all the persons of whom I have made inquiries I think it has fallen off very much.

20,006. Do you yourself know anything about the case in reference to the oysters which has already been spoken of?—No; but I learned last year that the Lympstone oyster dealers are in the habit of being to the bight and taking away many tons.

The witness withdrew.

J. E. Kingdon.

JOHN EYRE KINGDON recalled.

20,007. (*Professor Huxley.*) You are anxious to make some addition to your evidence?—Yes. There is a canal running down to near Powderham. The fresh-water runs out on the Powderham side into the salt water. There these small fish are found in May about an inch or 1½ long. They increase in June to about 3 inches, and you may catch as many as you please of them. There are a great number of people who resort to that place. They get their tea and whitebait. I have myself caught millions of whitebait there with a sort of square net.

20,008. (*Mr. Lefevre.*) Are they the true whitebait?—They say they are. The Londoners have examined them, and have come to the conclusion that they are the true whitebait. We never find any of them with a roe in them.

20,009. They never have any roe?—No, the largest of them in the winter time is very small.

20,010. Do you conclude that they are the young of other fish?—No, we think they are the regular fish which come to the entrance of the canal for a certain time; then as they get larger they go up to spawn. They come in May, and in August they are all gone.

The witness withdrew.

W. R. Scott.

WILLIAM ROBSON SCOTT called and examined.

20,011. (*Professor Huxley.*) Have you paid attention to this question of the whitebait which is found here?—Yes.

20,012. What is your opinion as to the nature of the fish?—In my opinion it is the true whitebait, although that opinion differs from the opinion of Professor Owen and Dr. Günther. You find the whitebait in Fowey River, in the Southampton River, and now you have the connecting link in those which are found in our own river. I cannot recollect just now what the particular objections were which were stated by Dr. Günther as to their not being the true whitebait.

20,013. Probably they had reference to the distribution of the teeth?—I think that was so: the teeth and the palate were submitted to Mr. Couch, and he was satisfied that they were the true whitebait.

20,014. (*Mr. Lefevre.*) Are large quantities taken here?—Yes, immense quantities.

20,315. Have they been taken for some years, or only lately?—For some years past.

20,016. (*Professor Huxley.*) Is there any particularly large traffic here in whitebait?—No.

The witness withdrew.

The inquiry was then adjourned until Thursday the 24th of December, at Wyke Regis.

Wyke Regis, Dorsetshire, Thursday, 24th December 1863.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

WYKE REGIS.

W. Thompson.

24 Dec. 1863.

WILLIAM THOMPSON called and examined.

20,017. (*Professor Huxley.*) You are a resident in Weymouth, I believe?—I am.

20,018. Have you known Weymouth for many years?—Yes, for about 13 years.

20,019. Are you acquainted with the fishing carried on there?—Yes, very well indeed.

20,020. What is the nature of the fishing that is carried on principally at Weymouth, not including the West Bay?—You are speaking now of Weymouth Bay proper?

20,021. Yes.—Including the bay here and at Smallworth Sands, we have trawling, seine-fishing, and hook-and-line fishing, besides lobster and prawn-fishing, and oyster-dredging.

20,022. What kinds of fishing are practised in the West Bay?—Mostly mackerel-fishing.

20,023. Seining for mackerel?—Yes, they catch mackerel in the mackerel seines.

20,024. How many trawl-vessels are there that go from the port of Weymouth?—There are two trawlers from Weymouth, I think, but most of the trawlers that hail from here belong to Portland.

20,025. How many trawlers are there that go from Portland?—I cannot say.

20,026. Have you any general notion of what the number is?—They are under half-a-dozen, I think.

20,027. Are they large vessels?—They are moderate sized vessels; they are not so large as the Barking trawlers; perhaps they will be about 50 tons.

20,028. What is the size of the beam they use?—I cannot say; I think you had better get that information from the fishermen themselves.

20,029. Is there much seining carried on here?—Not much in the winter months; the seining mostly practised here is the mackerel-seining in the summer time.

20,030. Is there much line-fishing?—Yes, there is a great deal of line-fishing.

20,031. Do you know how many persons are employed in Weymouth in line-fishing?—I cannot tell you that.

20,032. Are you aware whether there has been any falling off in the catch of fish in the Bay of Weymouth of late years, or whether it has increased or remained stationary?—I believe there has been a very great falling off in the number of fish caught.

20,033. Does that apply to all kinds of fish?—Yes, to the fish that have generally been caught here. Of course it does not apply to herrings or mackerel, which are fish of passage, and it has nothing to do with the local fishing; but the other fish, such as whiting, and the different descriptions of flat-fish have very greatly fallen off of late years.

20,034. Is that within your own knowledge?—

Yes, there has been a great falling off within my own knowledge.

20,035. Has it ever been the practice to send fish from this place to London?—It mostly goes to Bath, I believe, but there is not much sent away at all.

20,036. Is there a great falling off in the quantity sent away, as compared with what was sent away in former years?—I believe there is a much greater quantity of fish consumed in Weymouth itself now.

20,037. To what cause do you ascribe the falling off?—To the destruction of the small fry, and to the small size of the mesh of the bunts of the net.

20,038. Do you mean the small size of the mesh of the seines?—Not of the mackerel seines, but of the seines which they haul in the bay here. You may very frequently see a very large number of the fry of different kinds of fish brought ashore and destroyed when they are hauling in these seines.

20,039. Have you seen that yourself?—Yes, I have seen it constantly.

20,040. Are the small fish that are brought up in that way altogether wasted?—Yes, they are left on the beach dead. Sometimes the children will pick them up and carry them away.

20,041. Are the large fish picked out, and the small left to die?—Yes; some of them are used as bait for catching lobsters and crabs; those that are required for bait are picked out and sorted, but after that is done there is a large quantity of small fry that are useless for any purpose whatever, and are only wasted.

20,042. Has the practice of seining in this neighbourhood increased within your recollection?—No.

20,043. When did you first begin to notice a falling off in the quantity of fish taken?—I daresay it will be seven or eight years ago; but there has been a gradual diminution for some years back.

20,044. You have noticed a gradual increase for seven or eight years?—Yes.

20,045. Did you notice whether the decrease in the quantity of fish was coincident with the increase in the number of the seine nets used here?—No, I did not notice that.

20,046. How many years has it been the practice of the fishermen here to use these seine nets in this bay?—I have no doubt they were used here long before I visited Weymouth.

20,047. Why do you ascribe the falling off in the quantity of fish to the use of the seine nets, if the practice of fishing with seine nets has been going on for a great number of years?—I ascribe it to that from having myself seen the large number of fry that are destroyed by the seine-fishing.

20,048. But do you not think that in former years the fry were destroyed in the same way?—No doubt seine-fishing has always been destructive to small fish.

20,049. In fact, the fry have been destroyed in the same way ever since the seine nets have been used?—Ever since I have seen the seining I have noticed that a quantity of fry has been destroyed by the nets.

20,050. (*Mr. Lefevre.*) How many years have you been acquainted with the fishing here?—I think it must be 13 years or more now.

20,051. (*Professor Huxley.*) If seining in this manner is the cause of the destruction of the fish, one would expect that the falling off in the supply of fish would be of long standing; but according to your impression, it has only been going on for seven or eight years, or at most 10 or 12 years?—I can give you an instance of the destruction that has been occasioned; and that is in the case of the silver whiting. At one time large quantities of silver whiting were caught in this bay, off the wreck of the Abergavenny. My men have frequently caught a dozen in one tide. Last year there was not a single whiting to be obtained. This year I have had my trammels out during the greater portion of the fall, and my men have only taken three whitings.

20,052. But do you not think that that is one of the fluctuations that happen now and then with regard to all fish?—I am not prepared to say that it is not; I am only telling you what the fact is.

20,053. Have you any suggestion to offer as to the mode in which this catching of the small fry could be prevented?—I think if the fishermen had any consideration for their own interests, they would know very well that it was against their interest to use nets of so small a character. It would be much more advantageous to them to use nets with a larger mesh at the bunt.

20,054. You think it would answer their purpose better to catch none but large-sized fish?—Certainly.

20,055. What is the size of the mesh that they use now?—I do not know.

20,056. We shall be able to get that from the fishermen themselves?—Yes.

20,057. Would you like to see some restriction placed on the size of the mesh?—Certainly; I think that is what is required.

20,058. What is the minimum size you would allow?—About 2½ inches.

20,059. Two inches and a half from knot to knot, or two inches and a half diagonally?—2½ inches from knot to knot.

20,060. Would that enable them to catch flounders?—I don't think it would prevent them catching flounders.

20,061. Would not a large flounder get through a mesh 2½ inches from knot to knot?—No, I do not think a large one would.

20,062. Not what you would call a marketable fish?—No, and I think the fishermen themselves would be disposed to fall in with my plan. They have no wish to use these small meshes if there were any general law regulating the fishing.

20,063. Then why do they not adopt some regulation among themselves if they think that the present mode of fishing they follow is injurious to their own interests?—I cannot say why it is, but it has generally been found that there is some person or other who will stand out and prevent any agreement being come to among themselves. I believe that if the fishermen would only be unanimous, they might do a great deal for their own interests.

20,064. Is there much lobster and crab-fishing in the bay?—Yes, a great deal.

20,065. Has that fallen off of late years?—It falls off occasionally. I hear great complaints at times of the fish being scarce.

20,066. How do you account for the falling off?—I don't think there is any reason that can be given for the falling off in the crab and lobster-fishing.

20,067. Is there much oyster-fishing in the bay?—Yes, a great deal. With regard to the lobster-catching, perhaps I may be allowed to say that some of the lobsters brought to the market are, in my opinion, almost too small to be of any use. Some of them are very small indeed.

20,068. You do not think that there has been much falling off in the lobster fishery?—No; it is a kind of fishing that varies very much. Sometimes the catch may fall off for a short time, and then, in all probability, it will improve again.

20,069. Have you ever heard many complaints made by the fishermen against the trawlers for coming into the bay?—I never heard any complaints made against the trawlers on the part of our fishermen.

20,070. I think you said that there is an extensive oyster fishery in this bay?—Yes.

20,071. Is it in a good condition, or is the supply falling off?—The supply of oysters is falling off very much indeed.

20,072. What is the reason of that?—I believe it is owing to strangers coming here from different parts and destroying the oyster beds. They take the oysters away when they ought not to be removed.

20,073. Is there any close time observed here with respect to oysters?—Yes.

20,074. What are the months?—They are the regular months, I believe.

WYKE REGIS.

W. Thompson.

24 Dec. 1863.

20,075. The regular close time is observed here?—Yes.

20,076. You ascribe the falling off of the oyster fishery here to the taking away of the oysters and the destruction of the oyster beds by strangers?—Yes.

20,077. Where do the strangers to whom you refer come from?—We have boats from Colchester and from Poole that come here.

20,078. Do they carry the oysters away to lay down in other parts?—Yes, and more than that, they carry away the young oysters when they are too small for laying down.

20,079. In that way do they destroy the beds?—They not only destroy the beds by removing the oysters that are already there, but they destroy the whole of the spawn.

20,080. You consider that a wasteful and destructive mode of fishing?—I have no doubt it is a destructive and wasteful mode of fishing. Many of the oysters they carry away are of no use to them. By the time they get them to the beds on which they desire to lay them one half of them are useless. I frequently see their vessels lying about here until they get a cargo.

20,081. (*Mr. Lefevre.*) That is not in the close months, is it?—I cannot say that it is.

20,082. Do you know what number of seine nets are used in the bay?—There are not a dozen I think altogether.

20,083. Has there been any increase in the number of late years?—I cannot tell you that; the fishermen here will be best able to answer that question.

20,084. Has the same course of fishing been carried on here from the earliest time you can recollect?—Yes.

20,085. Do you know what amount of ground is fit for seining here—how much of the bay?—They can use the seine on the whole of the Smallworth Sands, unless there happens to be a wreck in any particular part. Wherever there is a wreck they cannot drag their nets.

20,086–7. Is there not a great deal of ground between here and St. Alban's Head that is unfit for seining?—I don't think they could haul a seine even at Ringstead. There is a ledge of rocks there that would prevent them.

20,088. When they are fishing for mackerel, do they catch many small fry in the seines?—I do not think that the mackerel net would hold much small fry. I never saw many fish in the mackerel nets that ought not to be there.

20,089. Do they ever catch any young herrings when they are fishing for mackerel in the bay?—They may do so occasionally, but they catch nothing to speak of.

20,090. Do they ever catch any young mackerel?—Sometimes they may catch a young mackerel. I saw one hooked the other day, only 10 days ago, at Portland.

20,091. Do the small fry caught in the seine nets mainly consist of flounders and small soles?—There are a large number of small mackerel caught towards the end of the season.

20,092. But not in the seine nets?—The seine nets would take them.

20,093. Do they take them as a rule?—They do not fish for mackerel specially with the seine nets.

20,094. Are the small fish you speak of principally flounders?—Yes, and different species of whiting. There are also small brill and small turbot.

20,095. Do they catch at the same time fish of a larger size?—Yes, the fish there run a little larger. Of course they do not fish for the small fish. The small fish are caught in the net when they are fishing for larger fish.

20,096. Do they sell these small fish for baiting the lobster-pots?—Yes, and that is another part of the evil we complain of. There are men in Weymouth who fish in the backwater more especially for bait for the lobster-pots. The nets they use are set nets. They reach across the channel. They have a man to stir up the bottom and drive the fish into the net. That is a trade of itself here.

20,097. Is there a great demand for these small fish for the lobster-pots?—I cannot say. The men who have the large seines would not employ them in fishing for bait alone. It would not be worth their while to do such a thing. They fish in the open sea.

20,098. Is there any seining of this description carried on in West Bay, or is there only mackerel and herring-fishing carried on there?—I believe there is seine-fishing, but they generally shoot their nets late in the evening. I have not seen them seining there.

20,099. What distance are the oyster beds you have been speaking of from the shore?—About three miles or three and a half.

29,100. Are there any that are more than three miles?—Perhaps some of them may be more. The bay being a semicircle, some of them may be more than three miles and a half from Weymouth, but still within a much less distance from the land.

20,101. Where are they taken?—Off the breakwater and under Whitenose.

20,102. Do they mainly lie in a line from the breakwater?—They lie in irregular patches off the breakwater.

20,103. Do you from time to time find fresh beds of oysters in the bay?—Yes, we are constantly finding new beds.

20,104. I understood you to say that there is a great demand on the part of boats from a distance for small oysters?—Yes.

20,105. Do you know what number of men from Weymouth are engaged in dredging in the course of a season?—No. I believe they do not dredge regularly. Most of them who engage in dredging have something else to do. I believe there are seven or eight boats altogether.

20,106. Are they large boats?—No, they are not of very large tonnage.

20,107. Has there been any diminution in the number of boats engaged in oyster-dredging?—I do not think there has.

20,108. Has there been any increase?—I think not, the fishermen do not think it worth their while to enter into the business.

20,109. Is there any measure you could suggest to us that you think would have a tendency to preserve the oyster beds?—Do you mean to protect the oysters on the beds?

20,110. Yes.—I think that object would be attained if an Act of Parliament were passed to prevent the oysters being destroyed when they are of small size.

20,111. You think that some regulation ought to be enforced to prevent the small oysters being taken away?—Yes.

20,112. Are there any oyster banks in this neighbourhood where the small oysters are laid down?—The late Lord Ilchester had some, I believe. I do not know whether the present Lord Ilchester has, but the late Lord Ilchester used to lay down a few in the Fleet water.

20,113. Where is that?—Inside the Chesil beach.

20,114. Is there much ground there fit for oyster beds?—I think that excellent oyster beds might be laid there.

20,115. Would the oysters breed there?—I don't see why they should not. There is a nice gravelly bottom upon a portion of it. Perhaps there is hardly fresh water enough to make them very good beds.

20,116. Is there any stream running into it?—Yes, there is one that runs down by way of Portisham.

20,117. I think you said that the strange boats carry away the spawn as well as the small oysters. I suppose you mean that they carry away the young oysters?—What I mean is that they carry away the dead oyster shells and different things of that description with the spat upon them. For instance, one oyster shell may have a dozen spat upon it,—a dozen little oysters the size of a fourpenny piece each.

WYKE REGIS.

W. Thompson.

24 Dec. 1863.

20,118. They would be young oysters already formed ?—Yes.

20,119. The oysters here spawn during the close season, I presume ?—Yes, they spawn regularly.

20,120. (*Professor Huxley.*) Have you any other observation that you wish to offer ?—Yes, I think there ought to be some restriction as to the fishing in shallow water at certain times of the year in the spawning season.

20,121. On what modes of fishing would you place the restriction ?—I think the fishing ought to be stopped when the fish come in to deposit their spawn. During the time the fish are spawning I think there ought to be a cessation of fishing, at all events, for a time.

20,122. Do you think there ought to be a cessation of all kinds of fishing at that time ?—Yes, in shallow water. I think the greatest quantity of the flat-fish deposit their spawn in shallow water.

20,123. Would you also put a stop to hook-and-line fishing during that particular spawning season ?—No.

20,124. Why not ?—Because if the fish are not in good health I do not think that they would bite much.

20,125. You would put a stop to seining during that time ?—Yes, certainly.

20,126. (*Mr. Lefevre.*) Do any of the French boats come here to dredge for oysters ?—I do not know that any French boat has been here.

20,127. They are mainly boats from the Thames ?—Yes, they are mostly from the Thames, or from Colchester and Poole.

20,128. When did the boats from a distance come in the greatest numbers fishing for oysters in your bay ?—I think the greatest number we ever had, we had about three years ago.

The witness withdrew.

J. Somers.

Joseph Somers called and examined.

20,129. (*Professor Huxley.*) Are you a resident here ?—Yes, I was born and bred here.

20,130. How many years have you been engaged in fishing ?—I have been fishing for more than 50 years.

20,131. What sort of fishing have you practised ?—Mackerel-catching and herring-catching chiefly.

20,132. Have you followed drift-net fishing or seining ?—Seining.

20,133. Herring-seining?—Yes, herring-seining and mackerel-seining.

20,134. Have you ever been a hooker at all ?—Very little.

20,135. Have you ever used the small seine in the bay ?—Yes, I have used the small seine for catching red mullet.

20,136. You say it is about 50 years since you began fishing ?—It will be more than 50 years now.

20,137. How many fishermen were there fishing in Weymouth Bay when you were a boy ?—There were as many then as there are now.

20,138. About the same number ?—Yes.

20,139. Were there about the same number fishing in West Bay ?—No, there are four times as many now fishing in West Bay as there were at that time.

20,140. Then the number fishing in Weymouth Bay has remained just the same, while in the West Bay it has greatly increased ?—Yes.

20,141. Have you noticed any falling off in the quantity of fish caught ?—Some years the fish will be very plentiful, and in others we do not catch as many.

20,142. But, taking one year with another, have you noticed any falling off in the quantity you catch ?—They have not fallen off much taking one year with another. If they fall off at all, in all probability they will come back again the next year.

20,143. You have been fishing mostly in West Bay, I believe ?—Yes.

20,144. What do you principally catch in West Bay ?—Mackerel, herrings, and sprats.

20,145. Do you use the small seine ?—Yes, the team seine.

20,146. What do you catch with that ?—Mostly red mullet.

20,147. Do you seine for red mullet along the Chesil Bank ?—Yes.

20,148. Is there as much red mullet to be caught now as there was formerly ?—Yes, I think there is rather more if anything.

20,149. You do not get flounders there ?—Yes, I do.

20,150. Do you get many ?—No, not very many flounders. We get more dabs than flounders.

20,151. Do you get plenty of soles ?—No, very few.

20,152. Do you ever get any other kind of fish in the team seines ?—Yes, we catch all sorts of fish.

20,153-4. What do you catch ?—Our nets are made to catch everything, from a sprat up to a whale.

20,155. Altogether, you have not much to complain of here?—No, taking one season with another. It is all according to the season. I believe the flat-fish have fallen off which those fishermen catch who go upon Smallworth Sands, owing to the construction of the breakwater.

20,156. Do you think the formation of the breakwater has done you harm ?—Yes.

20,157. How has it done you harm ?—It has kept the fish out.

20,158. What is the size of the mesh that you use in the team seine ?—Some part of the net is about 7 inches.

23,159. What part of the mesh of your team seine is 7 inches ?—The outside wings.

20,160. Do you mean that it is 7 inches from knot to knot, or across ?—Across.

20,161. How long is the team seine ?—Some have got longer seines than others.

20,162. But taking the average run, how long are they ?—Perhaps 70 or 80 feet long.

20,163. How deep are they in the bunt ?—From 14 to 18 feet.

20,164. There is only a bunt, no pocket ?—No, there is no pocket.

20,165. Do you cork the top ?—Yes.

20,166. Do you load the foot ?—Yes.

20,167. With what ?—Lead.

20,168. What does a seine net such as that cost ?—It costs a good bit of money.

20,169. How much ?—Before it is ready to work it will cost 20*l.*

20,170. How many are there used in West Bay now ?—God Almighty knows, I cannot tell.

20,171. How many do you think ?—Perhaps 40, but they are not all from this place.

20,172. But they are all used there ?—Yes.

20,173. How many more are there now than there were when you were a boy ?—Going back to my first remembrance when I was boy, I can recollect when there was only one mackerel seine.

20,174. How many team seines were there ?—Not more than one or two.

20,175. Then there are 20 or 30 times as many as there were formerly ?—Yes, I think so.

20,176. How do you use the team seine; how many men does it take to work it ?—It takes five men.

20,177. Does it require two boats ?—No, only one boat.

20,178. Do you make one end fast to the shore ?—No, a man bides on shore with it.

20,179. And then you take the seine out with you in a boat ?—Yes.

WYKE REGIS.

J. Somers.

24 Dec. 1863.

20,180. You work round with it?—Yes.

20,181. And haul it ashore?—Yes.

20,182. How long are the mackerel seines?—About 150 fathoms long.

20,183. How deep are they in the deepest part, in the bunt?—58 feet.

20,184. Is there any pocket?—There is a bag.

20,185. A bag instead of a bunt?—No, a bunt and a bag as well.

20,186. Both?—The bag is put into the bunt.

20,187. How deep is the net in the bunt part?—58 feet.

20,188. Do you load that with lead?—Yes, with lead and with stones too.

20,189. How much does a net of that kind cost, fitted up with corks, lead, and everything else?—It will cost well up to 100*l.*

20,190. How many of these nets are there in West Bay now?—God knows; I know how many there are at Wyke.

20,191. How many are there here?—There are 10.

20,192. Are there any further up the coast?—There are 10 at Chickeral. I consider there may be 60 up to Bridport.

20,193. There are about 60 between here and Bridport?—Yes, there will be 60 at least.

20,194. How many of these seine nets were there when you were fishing as a boy?—I cannot tell.

20,195. Can you make a rough guess?—There was not more than one at Wyke; there might be one or two at Chickeral; there were only 4 at Portland, and now there are 20.

20,196. Should I be right in saying that at that time there were a quarter the present number?—Yes.

20,197. Has there been a great increase in the number of fishermen also?—Yes, of course there has, or else we could not work the seine nets.

20,198. Then you have been flourishing?—Yes, since the peace, and since they put a stop to smuggling.

20,199. Putting a stop to smuggling has increased the number of fishermen?—Yes; they had something else to do before that they liked better.

20,200. That has been better for everybody, has it not?—I don't know that.

20,201. You really have nothing to complain of on this side of the water?—Not with regard to catching the fish in the season. Some seasons it is very bad. Then some seasons it may be middling. Then again all boats do not do alike. Some will do well, and some of them do badly; but it is all according to the way in which the fish come to the net.

20,202. Taking it on the whole, the value of your nets having steadily increased, and the number of fishermen increased, I suppose you catch quite as many fish as you did formerly?—Yes; but formerly there were not as many to catch them.

20,203. But you get more fish in proportion to your nets?—Yes, we get more in proportion.

20,204. Have you anything to complain of at all?—No.

20,205. Does anybody meddle with your nets?—No.

20,206. Do the Coastguard men ever look at your nets?—Yes, some of them will come up occasionally, when we are catching fish, and if we require their help in this bay, they give it to us. We cannot catch fish at all times, there is so much sea on, and if we had no bay we should catch none.

20,207. Then you and the Coastguard men are good friends now?—Yes, very good friends.

20,208. Does anybody ever look after the size of the mesh of your nets?—No.

20,209. Do you use what mesh you like?—Yes, they are alike over here.

20,210. What is the size of the mesh of your mackerel seine?—6 or 7 inches.

20,211. Is that in the bunt?—No; in the outside wing.

30,212. What is it in the bunt?—2½.

20,213. Two and a half diagonally, not from knot to knot?—Yes.

20,214. Is this (*producing a net*) the size of the bunt of the mackerel-net?—Yes.

20,215. That is only about half an inch?—We have only one part of the net of that size.

20,216. This is about half an inch from knot to knot?—I suppose it is.

20,217. Do you make use of the same seine for catching herrings as for mackerel?—Yes, it is all one thing, and we catch sprats with it also.

20,218. Do you catch many sprats here?—Yes, sometimes we get a great quantity.

20,219. What time of the year do you get them?—About October.

20,220. How long is the bag of your mackerel seine, how many fathoms long?—It is about 3 fathoms long.

20,221. Where are your fish principally sent to?—They go to all parts.

20,222. Do you sell it to the dealers?—Yes; some of them come from London.

20,223. Does a great deal of your fish go to London?—Most of the mackerel goes there.

20,224. Has the price of fish improved of late years; do you get more money for it than you did formerly?—I do not think there is much difference.

20,225. Is not the price better now that you have a railway and can send the fish direct to London?—That is the way they send it now.

20,226. But do you not get a better price for it in consequence of that?—No, I think not.

20,227. Do you not get more for it now than you did 50 years ago?—No, we do not one quarter as much. I have been selling mackerel on the beach at 7*l.* the cwt. Now it is difficult to get 1*l.* a cwt. All we get is 15*s.* or 18*s.*, and sometimes we even get less than that, if there is any great quantity caught.

20,228. I presume you could not find a sale for all the produce of your 40 or 50 seines unless you had the railway?—A small quantity was caught at the time I speak of, and we never found any difficulty in getting rid of it.

20,229. But if you had caught the same quantity then would you have been able to dispose of it without the railway?—We should have got a great deal more money for it if we had.

20,230–1. (*Mr. Lefevre.*) Do any trawlers come in here?—None of them come in to annoy the fishermen here. They trawl away further to the westward.

20,232. What is the character of the bottom here; is it sandy or rocky?—It is rocky.

20,233. Then it is not good for trawling?—No.

20,234. Are all your boats open boats?—Yes.

20,235. You have no decked boats?—No.

20,236. Are there any oyster beds in West Bay?—I don't know. We never used to dredge there.

20,237. Did you ever see any boats dredging for oysters there?—No; but there used to be a fine bed of oysters away off the Bill 10 or 12 years ago, but these countrymen came and they cleared them all away.

20,238. Has any one dredged for them lately?—No.

20,239. Whereabouts was the bed you speak of?—Just off the Bill of Portland, on the west side of the Bill of Portland.

20,240. Do you use drift nets for mackerel?—No.

20,241. Do you catch them entirely with the seine?—Yes, and the draught net.

20,242. Do you catch flounders in the seine?—No, very seldom. We very rarely catch any small fish at all. Sometimes we catch a few fine dabs.

20,243. Do you catch any flounders?—No.

20,244. Any young whiting?—It is very seldom that we catch young ones at all.

20,245. Do you fish for the whitings with hook and line?—No.

20,246. Not in West Bay?—No.

20,247–8. Is it not worth your while?—No.

WYKE REGIS.

J. Somers.

24 Dec. 1863.

20,249. You have not many herrings off here?—No.

20,250. Have you any herring nets?—Some of the fishermen have, but it won't pay. We seldom have them hauled in here at all. Some years there are a terrible quantity of herrings here, and then we may go for several years before we see any again.

20,251. Do you catch them sometimes in the seine nets?—Yes.

20,252. When does your mackerel season begin?—We don't often catch any before April.

20,253. How long does the season last?—We may catch a few until October.

20,254. Have you observed any falling off in the mackerel-fishing of late years?—No.

20,255. Do you think they come as far eastward as they did in former years?—Yes, I think they do.

20,256. (*Professor Huxley.*) At what time are the mackerel full of roe?—They spawn in the beginning of June. In April and May they are in spawn.

20,257. Do you find small mackerel here all the year round?—No.

20,258. Do you not find them in-shore?—No; we rarely see small mackerel till after Midsummer.

20,259. (*Mr. Lefevre.*) How far along the bay do the Wyke Regis men fish?—They fish in all parts of the bay; they go as far as Bridport sometimes.

20,260. Do they meet other fishermen there?—Yes.

20,261. Does your experience tell you that there is anything in the fishing that ought to be altered?—No.

20,262. Is there anything that does you harm?—No, and I do not see what alteration can be made, except it be with regard to the fastenings we have about here along the beach.

20,263. What do you mean by "fastenings"?—Rocks and old wrecks.

20,264. (*Professor Huxley.*) Sunken wrecks?—Yes.

20,265. Do they interfere with your fishing?—Yes, they tear our nets all to pieces. If there is a wreck, and we get a flood tide and shoot off, the tide heaves us up, and then we tear all our nets to pieces.

20,266. The wreck at the bottom of the sea tears your nets?—Yes.

20,267. Would it be of great advantage to you if the wrecks you speak of were blown up?—Yes, that would be the best thing that was ever done for us, it we could get rid of these fastenings.

20,268. (*Mr. Lefevre.*) If it were not for the wrecks you speak of, would there not be good ground for trawling along the West Bay?—Yes, perhaps it might.

The witness withdrew.

RICHARD WILLIAMS called and examined.

R. Williams.

20,269. (*Professor Huxley.*) Are you a fisherman here?—Yes.

20,270. How long have you been a fisherman here?—I knew all about it when I was a little boy, 50 years ago.

20,271. I believe you heard what the last witness told us?—Yes.

20,272. Do you agree with what he stated?—Yes, I quite agree with him.

20,273. Is there anything you wish to add to what he said?—Nothing at all.

20,274. (*Mr. Lefevre.*) Are you a Wyke Regis man, or a Weymouth man?—I am a Wyke Regis man.

20,275. Do you know anything of the fishing in the Bay of Weymouth?—Nothing, except the fishing with the small team nets in the bay.

20,276. (*Professor Huxley.*) At what time of the year do you do that?—In the fall of the year.

26,277. What fish do you catch in that way?—Mackerel and flat-fish.

20,278. You get flounders?—A few.

20,279. Soles?—Sometimes.

20,280. Do you get any plaice?—A few.

20,281. Do you catch a great quantity of small fish when you are using the seine?—Sometimes we catch a few; we cannot avoid it.

20,282. Do you catch a great many?—Not very many. Sometimes we may haul ashore scarcely 10.

20,283. But sometimes you haul more ashore?—Yes.

20,284. At what time of the year do you haul ashore the most?—I cannot tell.

20,285. Do you use this team seine only in the fall of the year?—Yes.

20,286. Am I to understand from you that the proportion of small and unsaleable fish you catch is very small compared with the rest of the fish you catch?—Yes, and we throw it into the sea again after we have picked out the saleable fish.

20,287. Does it not sometimes happen that you leave it on the shore to be picked up by the gulls?—Very seldom.

(*The witness Thompson.*) Perhaps I may be allowed to explain. The complaints which are principally made are not against the fishermen of Wyke, but against the fishermen of Weymouth. The fishermen of Wyke, even although they use the seine, take more care than the others. It is the Weymouth men who are so constantly out with the small seines, and who cause so much destruction.

RICHARD WILLIAMS' examination continued.

20,288. (*Professor Huxley.*) Do you practise any hook-fishing?—No.

20,289. Is it not practised in the bay?—Not from Wyke.

20,290–1. Do no fishermen out of Wyke use the hook?—No; perhaps they may be out for an hour or so in West Bay.

20,292. Is there not good ground off here for long-line fishing?—Yes.

20,293. Then why is it not followed?—Because we have never been in the habit of following it. I believe every place has its own way of fishing.

20,294. (*Mr. Lefevre.*) Do you find that you can make money by fishing in the mode you do?—We make very little at times.

20,295. (*Professor Huxley.*) Then why do you not take to the long-line fishing?—We could not launch a boat here in all weathers. We are obliged to fish here in a very heavy sea at times.

20,296. Your boats are all open boats, are they not?—Yes.

20,297. Is there anything that you wish to suggest to us?—No.

20,298. There is nothing you wish to add to the evidence of the last witness?—No.

20,299. (*Mr. Lefevre.*) How long have you used a net in Weymouth Bay?—Ever since I was a boy.

20,300. Have you used one every autumn?—Yes, we generally go in the autumn. Sometimes we catch a few little fish, and sometimes none.

20,301. How long do you fish in the bay in the autumn?—Up till about now.

20,302. Until nearly Christmas?—Yes.

20,303. Two or three months?—Somewhere thereabouts.

20,304. You have done that every autumn since you can recollect?—Yes.

20,305. Have you observed any falling off in the number of fish?—Not at all.

20,306. There has been no falling off?—No; they are just about the same as when I was a boy as far as I can see.

WYKE REGIS.

R. Williams.

24 Dec. 1863.

20,307. You are sure that you catch as many fish in that way now as you caught when you were a boy?—Latterly we cannot catch as much on the Smallworth Sands on the west part of Weymouth Bay.

20,308. Is that in the bay?—Yes, it is all in Weymouth Bay as it were.

20,309. (*Professor Huxley.*) That is the mouth of the Fleet, is it not?—Yes.

20,310. (*Mr. Lefevre.*) But in the other parts of the bay you catch as much as you did when you were a boy?—Yes.

20,311. There are more men fishing now than there were when you were a boy?—Yes.

20,312. Then the whole quantity of fish caught there must be more than it was in your earlier days?—Certainly it must be, because there are more boats.

20,313. And each boat catches as much as it did?—Perhaps not quite as much on an average as they did 10 years ago.

20,314. You think they do not catch quite as much?—No, not quite as much on the average. Down on our sands here it has been very bad this last season.

20,315. What do you attribute that to; to a bad season, or what?—Since the breakwater has been made it has taken away all the sands.

20,316. Is there more mud now?—Yes.

20,317. And not so much sand?—No. I have known 3 feet of sand, and now there is scarcely a bit of sand to be seen.

20,318. Then the building of the breakwater has had a great effect on the fishing?—Yes, it is all mud and shingle where it used to be sand.

20,319. Is there no current to carry it away?—No, there is no current at all.

20,320. Then you think that the falling off in this part is due to the breakwater, and not to the catching of small fish?—It is altogether owing to the breakwater. There is a wide difference there as compared with what it used to be.

20,321. Do you sell the fish you catch in the team nets in the bay, or do you send them by railway?—We hardly catch enough to supply the inhabitants of our own coast.

20,322. Do you sell any to the lobster catchers?—None at all.

20,324. Do you not sell small fish at all?—No, we never take any small fish home. We only take saleable fish.

20,325. You throw the rest out into the sea?—Yes, we turn the bunt inside out, and let them go into the sea.

20,326. Have you any complaint to make of those who do catch them and leave them to rot on the shore?—No, they hardly know what they catch.

20,327. Does it do any harm to your fishing?—No, I think not.

20,328. You have not observed any falling off?—No.

20,329. Is there anything else you wish to say?—No, except with regard to the fastenings in the bay. There are several wrecks up and down the beach, and frequently when we are shooting our nets if we get hold of them it may throw us out of earning 40*l.* or 50*l.* The nets get fast to these fastenings, and we are brought up until the tide slacks. Then we are obliged to take the nets into the boat again, and perhaps there may be 5*l.* or 10*l.* damage done to the nets themselves, let alone what we may lose by losing our day's work.

20,330. Is that in West Bay?—Yes.

20,331. Are there a great number of wrecks there?—Where we fish there are four.

20,332. Are they old wrecks?—Some of them are old wrecks. One in particular has been there since the remembrance of man, and has done thousands of pounds' worth of damage.

20,333. (*Professor Huxley.*) Would it not be worth your while to subscribe and blow it up?—We cannot do that.

20,334. Surely it would be better to do that than to lose 40*l.* or 50*l.* every now and then?—I don't know about that.

23,335. Is it an old wreck?—Yes.

20,336. What depth of water is it in?—About 8 fathoms.

20,336. Then it could not be got at without a diving bell?—No.

20,337. (*Mr. Lefevre.*) Does the shore fall very rapidly?—Close to the shore you get into 5 fathoms.

20,338. Does it fall very rapidly from the bank?—It goes gradually down to the centre.

20,339. What depth of water is there 100 yards out?—100 yards out you get into 3 fathoms.

20,340. What depth is there 200 yards out?—You get into 10 fathoms then.

The witness withdrew.

T. Sprackling.

THOMAS SPRACKLING called and examined.

20,341. (*Professor Huxley.*) Are you a fisherman here?—Yes.

20,342. How many years have you been a fisherman here?—For more than 30.

20,343. Did you hear the evidence that was given by the last two witnesses, Somers and Williams?—Yes.

20,344. Do you agree with it generally?—Yes.

20,345. Is there anything you wish to add to what they have already stated?—Not in the least.

20,346. Is there anything that you desire to remark upon?—Not in the least.

20,347. (*Mr. Lefevre.*) Do you fish mainly in West Bay or in Weymouth Bay?—In West Bay. Sometimes I fish in Weymouth Bay for red mullet or any other fish that will come to the net.

20,348. You do not fish, like Williams, in the autumn in Weymouth Bay?—Yes, just the same as he does.

20,349. Do you agree with him that the fish have not fallen off in Weymouth Bay?—Yes, but I think that owing to the westerly winds we get less at this time of the year. The more westerly winds we get at this time of the year, the less fish we catch.

20,350. In Weymouth Bay?—Yes, when the wind is in the east the more fish we catch, both silver whiting, herrings, and everything else.

20,351. Taking an average of years, do you catch as much fish in Weymouth Bay now as you were in the habit of catching formerly?—Perhaps not quite so much, but it is all according to the season. I have known the time when we caught 7,000, 8,000, or 9,000 whitings in one haul.

20,352. Do you think the breakwater has anything to do with the falling off?—Yes, the breakwater and the winds. The wind beats the fish right out of the bay.

The witness withdrew.

T. Bye.

THOMAS BYE called and examined.

20,353. (*Professor Huxley.*) Are you a Weymouth fisherman?—Yes.

20,354. How long have you been fishing from Weymouth?—It is about 40 years since I first began.

20,355. What kind of fishing have you practised during that period?—Hook-and-line fishing, and dredging.

20,356. Dredging for oysters?—Yes.

20,357. What else?—Before that I have been catching quins.

20,358. What are they ?—Little scollops. I have followed that for 40 years.

29,359. Do you use a dredge for them ?—Yes, and a hook and line. I had a set net once, but I am getting old, and I don't trouble about it.

20,360. Have you ever worked a team net, a small seine ?—No, never.

20,361. What did you catch with the line-fishing when you first began ?—Whiting, and different kinds of fish.

20,362. Did you get plenty of silver whiting ?—Sometimes I caught a few off the wreck of the Abergavenny.

20,363. Did you get many when you began ?—Sometimes I got a good catch.

20,364. And sometimes not ?—And sometimes not. The reason has been that we have sometimes had a winter when it has not been fit to go out to catch them. That is the reason why we have not been able to catch them.

20,365. Do you think there are as many fish now as there ever were ?—The fish seem as plentiful as they ever were before. Some of the fishermen went off the other day, and they had a good catch, but they have not had favourable weather for going again.

20,366. (*Mr. Lefevre.*) Do you go outside the breakwater ?—Yes.

20,367. (*Professor Huxley.*) When the weather is favourable, do you catch as many silver whiting as you ever did ?—It depends on the herrings. The silver whiting generally follow the herrings and sprats. If we have a good sprat season it is also good for the silver whiting.

20,368. Have you caught more in former years than you do now ?—We have caught a great many more in former years.

20,369. Do you think on the whole that the supply of silver whiting has fallen off ?—Yes, it has fallen off a great deal, compared with what it was years ago.

20,370. Has the catch of any other fish fallen off ?—I do not find much difference in what we call the coal whiting or the pollack.

20,371. Do you get the pollack here ?—Not a great many of them.

20,372. Is there much line-fishing now practised in Weymouth ?—Yes.

20,373. How many persons are employed in it ?—Never more than two, and sometimes they go out singly.

20,374. I mean how many follow that fishing altogether ?—I am sure I cannot tell you. Mostly all our men go at times, if they have nothing else to do.

20,375. How many are there altogether, at a rough guess ?—Perhaps there may be a dozen.

20,376. Were there more when you were fishing as a boy ?—No, not half as many. They had other employment.

20,377. Then the number of line fishermen has increased ?—Yes, but I suppose it is because they have had nothing else to do.

20,378. Do they contrive to get a living out of it ?—They get a living, but not much of a living. Nevertheless, something is something, and they manage to rub through the winter with the summer.

20,379. Is it your experience as a fisherman during the last 40 years, that, taking one thing with another, there is as much fish as there was formerly, or that there is less ?—I have caught more fish years back than I can catch now.

20,380. How long ago did you catch more ?—Thirty years ago I caught considerably more with the hook and line.

20,381. Has there been a very remarkable falling off ?—I don't know that, but there are not as many as there used to be. We, however, put it down to there being so many more fishermen to catch them.

20,382. I will ask you about the cause by-and-by. I want the fact now. Do you think there are less fish caught altogether now than there were 40 years ago ?—I do not think there is. An individual may not catch as many, but there are so many more fishermen now engaged in fishing that I should think there are pretty nearly as many caught as there ever were.

20,383. Is there as much fish brought to the market now by all the boats as there were 40 years ago, or is the quantity brought to market less ?—I don't believe that there are as many quite.

20,384. You do not believe that all the men fishing now catch as much as the few men formerly caught ?—No.

23,385. What is the reason of the falling off ?—I cannot tell.

20,386. Have you any notion or idea on the subject ?—No, I cannot tell what the reason is.

20,387. Has the scollop-fishing fallen off ?—There never was a great many caught here.

20,388. Are there as many caught now as there were formerly ?—I cannot tell. Since the last hard winter we had they seem to have fallen off. That hard winter killed them all around and below the breakwater. I have caught them on both sides, both on this side and below the breakwater.

20,389. How many persons in your knowledge have been engaged in the scallop fishery ?—Not more than three or four. There are not many who care about going out. If we catch one, two, or three dozen, we think we do very well. It is not a fishery that pays.

20,390. Have you ever been oyster dredging ?—Yes.

20,391. Are there as many oysters now in the bay as there were formerly ?—No.

20,392. How has that come about ?—I will tell you. I think it is just the same as a bird that has a nest and lays its eggs in it. If you go and kill the old bird, and destroy the eggs, you cannot expect the young ones to come.

20,393. Do you think that that is what has taken place ?—Yes, the brood have been taken out of the bay.

20,394. Who has done that; who has taken your brood away ?—The vessels from Feversham and the east country.

20,395. They have taken away all the spawn, and the small oysters ?—Yes.

20,396. Everything they could get ?—Yes, and I may tell you that if they had not come and taken that brood of young oysters away, the Weymouth and Portland boats would not have been able to have fished out the beds as long as they lived. We only catch what is saleable. We throw the others back again. We have very frequently, after we have caught oysters, brought the brood down and thrown it over inside the Abergavenny, thinking that the east country boats would not go there, yet they have even found that place out, and have gone and cleared all the oysters away.

20,397. They have come and taken the oysters you have put down there ?—Yes, we threw them out, as we went along, and spread them over the ground.

20,398. Do you think it a hardship that these oysters should have been taken away by the east country boats ?—Yes, I think if they come here to dredge, they ought only to take away what is fit for the market, and fit to eat, and that they should be compelled to throw the others overboard. If they did that they would make the beds larger, and they would be able not only to work them, but to obtain fine oysters. The oysters would have a much better opportunity of growing than they have now.

20,399. Is that the chief thing you have to complain of in Weymouth Bay, or is there anything else that does you harm; do you think that the use of the small seines or team nets does you harm ?—I cannot say anything about that. It is all according to the way in which they are worked.

20,400. What is a good way of working them, and what is a bad way ?—If they drew up the small fish and threw them in again that would do no harm.

20,401. They would do no injury to the fishery if they did that ?—No.

WYKE REGIS.

T. Eye.

24 Dec. 1863.

20,402. Have you noticed the small team seiners here take a quantity of young fish ashore and leave it to rot there?—It does not matter what sort of mesh you have in these small teams because the weeds get in and fill the meshes up, so that the fish cannot get out.

20,403. Then that was so much fish destroyed?—I cannot say. I have not had much to do with the team nets. But of course there must be some destroyed.

20,404. But do you think that the destruction which is caused in that way has been the cause of the falling off in the supply of fish in the bay?—I do not think that it has.

20,405. (*Mr. Lefevre.*) You yourself never take up the small oysters, do you?—No.

20,406. You do not carry them away?—No.

20,407. You do not sell them to anybody?—No, they are of no good to us.

20,408. Cannot you sell them to the Colchester men when they come here?—No, they are not fit for anything.

20,409. They are not large enough for eating?—No.

20,410. But they are large enough to place on beds?—For that purpose the smaller they are the better. They go down to China rock in the east country and lay them down; one tub of oysters will produce three in the course of 12 months.

20,411. And they are better for eating after they have been laid down?—Yes, they are better for eating after they have been laid between the fresh water and the salt.

20,412. Are they better than the large oysters here?—Those we have had here which have been eatable are very good; they are very fat fine oysters.

20,413. Are there any places in the Fleet where you can lay them down?—We have never tried to do so. If we were to lay them down in the harbour, we should have them stolen from us.

20,414. Are there no private rights here?—Yes, I believe there are.

20,415. Do they let out the right of laying down oysters?—No; one old man here caught some and brought them in, and laid them down again near the quay against the bridge at the southern side, and I believe he sold those oysters. He sent up two bushels as a sample, and by-and-by down came these vessels. He went on catching them at 3*s.* a bushel. He caught 18 bushels of small stuff in one day, and he carried it away to these vessels and sold it.

20,416. Then there is, in fact, a market for the sale of these small oysters?—No, we do not sell them at all—none of us who go catching them; they are of no good to us.

20,417. Do you from time to time find fresh oyster beds in the bay here?—We have found two or three new beds, but these boats have destroyed them.

20,418. As soon as you find a fresh bed, do these boats from a distance come and carry the oysters away?—Yes, certainly.

20,419. Both the old and the young?—Yes, but they take the small ones in preference.

20,420. Do they not leave enough to breed from?—No, they have destroyed the whole lot. If I went there all day now, I should not catch 200, perhaps not 100.

20,421. How long ago is it since you last found any to speak of?—It must be three years ago now.

20,422. Do you think that those which have been left behind have not been breeding?—No, they are thin.

20,423. Then, am I to understand from you that there has been no oyster-dredging here for the last two or three years?—No, no more than this, that occasionally people have gone out oyster-dredging from motives of curiosity.

20,424. They have not gone out to make a livelihood of it?—No; sometimes they go out to collect those curious things that you put in bottles. I am a hooker and a dredger myself; I have nothing at all to do with nets.

20,425. For the last two or three years it has not been worth while for anybody to go dredging for oysters in the bay?—No.

20,426. Do you think the making of the breakwater has had anything to do with your fishing here?—Perhaps it may have had; I cannot say. The fish have more shelter now; they get about the breakwater a great deal; they run for it as a harbour, like a vessel at sea.

20,427. Have the pollacks increased about the breakwater?—Yes, and the mullets; one fisherman caught 2,000 mullets with a hook and line.

20,428. Close to the breakwater?—Yes, close in among the piles.

20,429. Do you go outside the breakwater to catch whiting?—Yes.

20,430. Do you catch more outside the breakwater than within?—That depends on whether the tide is at the ebb or the flood.

20,431. In former times did you go more outside the bay?—It is just this: if you have a field on shore, you put up a hedge or wall in order to keep the cattle in. It is the same here. The fish run where they they have a thoroughfare all up the passage and down. They used to come into all parts of the bay; now they must come through the open, or they are otherwise stopped out, unless they go round, and then probably the tide will have altered, in which case the fish would strike away.

20,432. Then you do not think there is the same opportunity now for the fish to come into the bay that there was before the breakwater was built?—No, not along here about the Smallworth Sands; but all around the breakwater there is a considerable harbour. They have plenty of fish there, and very large ones too.

20,433. Whiting?—Yes.

The witness withdrew.

J. Fowler.

JONAH FOWLER called and examined.

20,434. (*Professor Huxley.*) Have you been engaged in the fishing here?—I have been engaged a little in dredging and line-fishing, but not much in seine-fishing.

20,435. You have done a good deal, I believe, in catching those little curiosities that the last witness spoke of?—Yes, I have done a little in that way at times.

20,436. You are acquainted with the fishing that goes on here?—Yes.

20,437. Do you agree with the previous witnesses with regard to the supply of fish in Weymouth Bay?—There is not the fish there used to be, but there are more fishermen to catch them. I think the breakwater makes a wonderful difference; the fish harbour round the breakwater, and it is not all the fishermen who can go there. The fish that are there now I think used formerly to be found around the Weymouth shore.

20,438. You think the fish harbour round the breakwater?—Yes, more than they ever did.

20,439. Is it not rather a benefit to the fishermen to have them there?—No, it is a benefit to the fish. You cannot use the teams and seines there. They don't come to Smallworth Sands.

20,440. But you can use the hook and line very well?—Yes, all along there.

20,441. Then the hookers ought to be all the better for it?—Yes, they are at times.

20,442. As regards the other kinds of fish in addition to those caught by the hookers, has there been any falling off there?—I have not been accustomed to use the seines myself.

20,443. But you know what goes on among the

fishermen ?—There are some little seines used about here, but I do not think that the seines or the big ones used on the Smallworth Sands do much harm. The little seines used in the harbour leave the fish to die, and they do a great deal of harm. The small fish they catch are left on the shore, and there they perish.

20,444. What are the little seines you speak of ?—I mean the little teams. They are little things 30 or 40 fathoms long. Two men and a boy work each of them.

20,445. Are they legal seines ?—I think so.

20,446. Have you observed much small fish hauled ashore by the little seines ?—I have seen some at times. Dozens of people have seen the same thing.

20,447. Is there a great quantity of small fish destroyed in that way ?—Sometimes there is as much as half a bushel of young fish destroyed when at the same time if they turned the net the other way, and allowed the fish to go into the water, they would all have lived.

20,448. Do you think this is a practice destructive to the fish in the bay ?—Well, fish are things that breed very fast. I should not say that it would injure the fish much, although it might injure it a little. A fish that is very small, will in the course of a few months be very much larger. In point of fact, I know of nothing that grows so fast as a fish.

20,449. (*Mr. Lefevre.*) Is half a bushel a large catch of these small fish ?—Yes, but I have known them to have a much larger catch of good fish on our sands. I have known them to have three or four bushels of flat-fish, all of which were saleable fish. Frequently they have had three or four bushels of good sizeable flat-fish in a net—flounders, dabs, and brill—all of them have been saleable. The smallest has been 9 inches long. But now they go into our breakwater for little flounders, and they catch small fish only 4 inches long for bait. In three or four months' time these small fish would have been 9 inches long.

20,450. Do they sell them for bait ?—Yes.

20,451. (*Professor Huxley.*) Is there anything else on which you wish to offer a remark ?—I should like to say something about the oyster-dredging.

20,452. What do you wish to say about that ?—There have been two or three or four of the best oyster beds in the West of England in this bay. I found out two or three of them myself. But as soon as they were discovered, the boats came here from the east country. Numerous vessels were sent here from distant parts to dredge for oysters. There have been as many as 12 vessels here. There were 12 here I think in the last fleet. One vessel took away the whole of the oysters dredged up by the other vessels. Now these oysters when taken of so small a size have no nature in them to enable them to live in the vessel's hold. The small fish will not live, although the large ones may live for three weeks or a month. One vessel took away 60 tons of oysters which were not larger than a fourpenny piece, and I believe that they did not succeed in saving a bushel of them. I believe they gave 4*s.* a tub for them.

20,453. That would be a wanton destruction of the fish ?—Yes, the whole of it died in the hold of the vessel. Now, I think there ought to be a law passed stringent enough to prevent the taking away of oysters of such a size, no larger than a fourpenny piece.

20,453*a*. In point of fact they are good for no one when taken in that way; you cannot depend upon conveying them to distant beds where they can be laid down ?—No, they are so small that 10 hours will kill them.

20,454. (*Mr. Lefevre.*) Then it must have been a bad speculation for the men who went there ?—Yes, but it was a great oyster merchant who could afford to lose it. Sometimes a great part of the cargo will live. He only gives 4*s.* a tub for the oysters. Perhaps a tub will hold about 10,000, but in the course of four years a tub will not hold 400 of the same fish. They grow very rapidly, and if he can only get them laid down upon the beds alive, he is enabled to realize a good profit.

20,455. (*Professor Huxley.*) You think it is worth while for him to lose one or two cargoes for the sake of saving the third ?—Yes; but these beds would never have been thinned at all if they had only taken away the eatable oysters.

20,456. You would not object to their being taken away to be laid down in other places if they left the brood ?—Yes, I should.

20,457. Are you of opinion that when they take the small oysters they destroy the brood without doing themselves any corresponding good ?—The brood would not be destroyed if they were not kept so long out of the water. The reason of their being kept out so long is that they cannot dredge enough to make a cargo, so that they wait until they get one. There have been 60 vessels here from the east country dredging in this bay at the same time. At one time the bay was almost full of oysters, but go where you will now you see nothing but old dead oyster shells.

20,458. (*Mr. Lefevre.*) How long ago is that ?—50 or 60 years ago. I have been at it for 25 or 30 years.

20,459. Do you agree with the last witness that the last time there was any quantity of oysters got here was three years ago ?—Yes, they were as thick then as grass on the ground. The first time I saw them I hauled up eight bushels in a dredge belonging to the Zoological Gardens. It was choke full.

20,460. Were they all small oysters ?—Yes, they were all small oysters, all cleaned.

20,461. Then there must have been a great destruction of the brood ?—Yes, and many vessels have been down successively raking them away since.

20,462. Before that time had there been but very few oysters ?—Yes, but four years before that I dredged a great number for the late Lord Ilchester, the size of a five-shilling piece.

20,463. Were they all carried away in one season ?—No, in about two. We had the boats down from Colchester and other places, and they dredged on Sundays and all days. They did not even let Sunday alone.

20,464. Then there was no interval ?—No. There may be a place where you can dredge 200 or 300 large oysters now, but that is all. The vessels of which I am speaking dredged 40,000 or 50,000 a day.

20,465. Do you know anything of the spawning of the oyster ?—No.

20,466. (*Professor Huxley.*) Is there anything else you wish to tell us ?—No.

20,467. Are there any regulations here that affect the fishing injuriously ?—No.

The witness withdrew.

ABEL WHITTLE called and examined.

20,468. Have you been engaged in the fishery here ?—Yes, a little.

20,469. Have you heard the evidence of the previous witnesses ?—Yes.

20,470. Does that agree with your previous knowledge and experience ?—Yes.

20,471. Do you wish to make any remark upon it ?—There is only one subject which I wish to mention, and that is the fastenings which have already been spoken of. I think they ought to be removed from Portland to Abbotsbury. They are the greatest injury of which we have to complain. Some of them are upwards of a century old, and some of them have been about there more than 10 years.

20,472. (*Mr. Lefevre.*) Would the expense of removing them be very great ?—It would not be very great; but the poor fishermen here have not the means of doing it. I know several fishermen who

WYKE REGIS.

A. Whittle.

24 Dec. 1863.

were almost half ruined last year on account of the destruction of their nets by these fastenings, and the fish themselves were allowed to escape.

20,473. Cannot you escape the fastenings?—We do sometimes, but sometimes a shoal of fish will go over the fastenings, and the tide will drift us across them, and there we are bound to remain until the tide changes.

20,474. Do you belong to Wyke Regis?—Yes.

20,475. Can you tell us the number of fishermen living here?—There are about 10 boats.

20,476. How many men are there in each boat?—Each boat will command about 12 men.

20,477. Then there will be about 120 men in all?—Yes; some of them come from Weymouth.

20,478. Do you know most of the coast of West Bay?—Yes.

20,479. Are there many small fishing vessels there?—There are some at Portland.

20,480. How many fishermen are there at Portland?—It depends on the fishing. The quarrymen come down at intervals.

20,481. How many boats have they got?—There are 10, or 12, or 14.

20,482. Do they carry on the same fishing as the Wyke men?—Yes.

20,483. Then it is nearly as large a fishing place as Wyke Regis?—Yes, it is even more so.

20,484. What is the next fishing place to the westward?—There are 12 boats, I believe at Chickeral, which is the next fishing place going westward.

20,485. How far is that from here?—They are all places close adjoining. It is about two miles on the beach.

20,486. How many boats belong to Chickeral?—10 or 12.

20,487. What is the next fishing place beyond that?—Langton.

20,488. How many boats are there there?—About six.

20,489. Are they fishermen mainly at Langton?—They are a labouring class of people who go for the fishing season, which commences about May.

20,490. At other times do they work as labouring men?—Yes, they go to the fishing when the fish come.

20,491. At Wyke the men fish all the year round?—Yes, they are principally fishermen.

20,492. That is not the case at Chickeral and Langton?—They don't depend so much on the fishing as we do.

20,493. What is the next fishing place?—Abbotsbury.

20,494. How many boats are there there?—About 12 or 14.

20,495. Are they in the same position as the men at Chickeral and Langton?—Yes.

20,496. They do not depend so much on fishing?—No.

20,497. What fishing places are there beyond that?—There is Swyer.

20,498. How many boats are there there?—About half a dozen; there are 10 at Puncknoll and Swyer together.

20,499. What is there beyond that?—You come next to Burton.

20,500. How many boats belong to Burton?—About six.

20,501. Then you come to Bridport?—Yes.

20,502. How many are there there?—None.

20,503. Beyond that there is Stanton and Lyme Regis?—They are beyond our district. We know nothing about those places.

20,504. In all the places you have mentioned has the number of boats increased of late years?—Yes.

20,505. What has been the increase?—Quite one-half.

20,506. Has that increase taken place within the last 20 years?—No, not quite within 20 years.

20,507. Within 30 years?—Yes.

20,508. Do they complain of the fishing having fallen off?—They do in some seasons. In some seasons it is worse than in others.

22,509. Do they complain, taking one season with another?—I think there are more fish caught altogether than were caught 20 or 30 years ago, taking into consideration the number of men and boats employed in fishing.

20,510. Do the fishermen send their fish away principally by rail?—Yes, some goes to London and the rest is sold in the neighbourhood.

20,511. What are the principal fish they catch?—Mackerel.

20,512. Do they catch mullet?—Very seldom. There is one thing they complain of, but I do not think that has anything to do with your inquiry. I refer to the backwater fishing, which Lord Ilchester claims as a private right. He prohibits the fishermen from fishing in the backwater.

20,513. Do they not fish there?—No, he will not allow them to go there.

20,514. Is the backwater not fished?—No, and there are mullets and eels there.

20,515. Is it kept for wildfowl shooting?—There is a preserve for that there, but it is a great piece of hardship for the lower class of people here. There are seasons when they cannot get anything else when they could go there and catch eels. Twelve months or two years ago there were a number of people taken up and imprisoned for it. They had no means of protecting themselves, and they were obliged to submit.

20,516. We are told that he has some oyster beds?—Yes.

20,517. Does he let them out?—Not that I am aware of. He keeps them for his own private use.

20,518. Does he lay down the oysters on his beds?—Yes, for his own private use.

20,519. (*Professor Huxley.*) Have you any further remarks to offer?—No; but for the good of the fishing in general I would anxiously press that the backwater should be opened to the poor generally.

20,520. Do you know anything of the fishing villages to the east of Portland?—No, the fishing to the east of Portland is of a nominal character.

20,521. What is the next place of importance eastward?—There is no fishing place of importance to the eastward near here. It is all rocky ground.

The witness withdrew.

T. Sprackling.

THOMAS SPRACKLING recalled.

20,522. (*Mr. Lefevre.*) Can you tell us where there is any fishing eastward of Weymouth?—I think the only place that has any seine nets is Lulworth.

20,523. But is there any fishing of any other kind?—There may be persons who go hooking. I believe they go hooking at Potham.

20,524. How many boats are there at Lulworth?—Five or six.

20,525. There is nothing much after that until we come to Poole?—No.

20,525*a*. Is there much fishing at Poole?—That is only a little town.

20,526. (*Professor Huxley.*) Does much fishing go on there?—Yes, in the season; it is mostly covered with sands, as it is here. They catch herrings, whitings, and mackerel.

20,527. How many fishermen are there at Poole?—There are not more than four or five boats.

The witness withdrew.

The inquiry was then adjourned.

Harwich, Essex, Monday, 7th March 1864.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

JAMES HOWARD called and examined.

20,529. (*Mr. Caird.*) Are you connected with the fishing here?—I am not exactly connected with the fishing here, although I have been connected with it in this part for the last 67 years.

20,530. Over what part does your knowledge extend? Are you acquainted with the fishing all along the coast of Essex, or does your experience apply more to the coast of Suffolk?—I have been for many years acquainted with the fishing all over the coast of Essex, all over the German Ocean, and in Norway and Sweden as well.

20,531. Then having had so long an experience, you can probably give us the information we desire with regard to the present state of the fishing interest here compared with what it was 15 or 20 years ago?—There is not now one-third of the fishing carried on here at Harwich that there used to be at that time.

20,532. Do you speak of all kinds of fishing or of any particular description?—There is not one-third of any description of fishing as compared with what it was formerly.

20,533. Taking 20 years ago what was the principal fishing carried on here?—At that time there was trawling, and I believe it would be about the beginning of the shrimping and what are called the trim-tram nets. It will not be more than 20 or 25 years ago since the first of them came here. Perhaps some of the regular trim-trammers may have been used here as early as 30 years ago. I cannot exactly state the date.

20,534. Was there any other description of fishing followed here?—Yes, there was the cod-fishing.

20,535. What is the principal fishery now?—There are a few trawl vessels belonging to Harwich, a few very small trawling boats, and there are a number of shrimpers, but I cannot tell you what the number of these shrimp boats is. They use what are called the trim-tram boats.

20,536. Will you be good enough to give us the particulars of that part of the fishing trade with which you yourself are best acquainted?—I understand every branch of the fishing trade, every description of it. I don't care what it is, I am acquainted with the whole of it.

20,537. Can you tell us what the supply of fish is in the place in which you are yourself located?—We have a different supply at different times of the year, and this is about the time of the year that we have the greatest supply. I believe, however, that we should be able to obtain a much larger supply if steps were taken to make an alteration in the size of the mesh of the net in use here, and to prevent the taking of small fish at a time when they are of no value to anybody. At present they kill a very large quantity of the brood here; they do that in all the rivers here. In this river, the Stour, for one, in the Ipswich river, the Orwell, and in all the rivers all along the coast. The destruction to which I refer goes on principally in the summer months, in May, June, July, August, September, down to the latter part of October. The small brood of almost every description of fish is taken and killed. Flounders, dabs, plaice, and all sorts of flat-fish come into the rivers here when very small, and thousands and tens of thousands of them are destroyed. I think that is a great evil, and it ought if possible to be prevented.

20,538. Has that destruction been of a recent date, or has it been going on for a long period?—It has been going on for many many years.

20,539. Has it not been going on as long as you can remember?—Perhaps hardly as long as I can remember, but it has been going on for a long time. At one time, within my recollection, the mesh of the nets was larger than it is now, and the small fish were able to escape.

20,540. Has the mode of fishing of which you complain been on the increase of late years?—Yes, because it has answered two purposes.

20,541. What purposes has it answered?—This small brood has been destroyed and brought ashore, and then made use of for catching crabs and catching whelks. The fishermen have destroyed hundreds of thousands of them for that purpose.

20,542. And has there been a diminution in the brood itself in consequence of the continuation of that mode of fishing?—Yes, there has been a very great diminution.

20,543. Are there not as many people employed now in that mode of fishing as there were formerly?—There are not as many employed now in trawling in the rivers.

20,544. Trawling in the rivers?—Yes.

20,545. Is that the mode of fishing you refer to as being destructive in the rivers?—Yes.

20,546. What kind of net do they trawl with?—They use a regular trawl net.

20,547. What is the size of the beam?—The size of the beam is according to the size of the boat. Perhaps some of them will be 22 or 23 feet long.

20,548. The large trawling boats use longer beams?—Yes; a trawling smack will have a beam 36 feet long or even longer, in proportion to the size of the vessel.

20,549. The kind of fishing you speak of, and of which you complain as being destructive, is not followed by the large smacks, but by smaller trawling vessels?—Yes; it is not followed by the smacks, but by boats of about 12, 14, or 20 tons.

20,550. Can you say positively whether the number of boats engaged in this description of fishing has increased or diminished during the last 10 or 20 years?—I should say they have diminished rather than increased.

20,551. Then the destruction of the brood is not so great now as it was formerly?—No, but it is very great even now, because it is only during certain months in the year that the brood is in the rivers and can be taken. I myself have witnessed the destruction which has taken place. Last summer I was out fishing for two or three nights with one of our boats, and I saw immense quantities of these small fish taken and destroyed. If they were allowed to come to maturity they might be caught when they would be worth having, and would be fit for the market, whereas they are taken now when they are absolutely useless.

20,552. (*Mr. Lefevre.*) What fish are principally taken by the small boats that trawl in the rivers?—They are principally little soles.

20,553. Do they consist entirely of small soles?—Not entirely. There are small soles, little flounders, dabs, plaice, thornbacks, and other fish. The trawl net takes everything.

20,554. Are these small fish when taken generally used for catching crabs?—They are generally. Some of them, if they are at all sizeable, are no doubt sold as food for the poorer classes to eat.

20,555-6. Then they are not all wasted?—A great many of them are used for what I have already told you, namely, catching crabs.

20,557. (*Mr. Caird.*) Are they used on this coast for catching crabs?—Yes, in the rivers.

20,558. Could crabs be caught without them?—Oh yes. Crabs may be caught in many different ways and by the use of different sorts of bait.

HARWICH.

J. Howard.

7 March 1864.

20,559. But are these small fish to which you refer considered the best bait for catching crabs?—That I am unable to say. I cannot tell you whether it is positively the best bait or not.

20,560. Are the small fish so caught used solely for the purpose of bait and not for the purpose of food?—If they catch any sizeable fish among the brood they pick them out and sell them for food, but all the rest are used for purposes of bait.

20,561. And are used for no other purpose?—For no other purpose that I am aware of.

20,562. Are you aware whether any portion is used for manure?—I do not think that any part is used for manure. I think there is not enough in quantity for that.

20,563. Then from what I understand you to say there is no positive waste of the fish. They are used in some way?—I think there is a waste, and a very great waste too.

20,564. In what way?—You have all these fish destroyed before they come to maturity. If they were not caught, but were allowed to remain in the water next season, they would probably be fit for food. All the little soles which you now have brought ashore at this and other places in the summer months, when unfit for the market, would, if allowed to go into the sea, come back again next season nice sizeable fish fit for the table.

20,565. Have you any proof that that is so, or that it would be so?—I have had proof enough of the fact to convince me that I am not mistaken, and I should not be at all afraid of taking my oath on the matter.

20,566. Within your experience has there been a decline in the number of the fish of that description which come to maturity on this coast?—Yes, I believe there has been a decline.

20,567. There has been a falling off compared with what the number was in former years?—Yes, I think so.

20,568. Within what period of time have you noticed the decline?—Within the last 40 years.

20,569. There has been a falling-off during that period?—Yes, and I believe it has been the same in the North Sea, on the same principle, in consequence of the Barking trawling men.

20,570. Who have been the sufferers in consequence of that decline?—The public generally.

20,571. How have the public suffered?—They have had to pay a higher price for fish.

20,572. Has any particular class of fishermen also suffered?—Yes.

20,573. What class?—Many of the smack owners have suffered as well as the public.

20,574. Do the owners of smacks not get as good a fishing now as they did in the times to which you refer?—No, nothing like it.

20,575. (*Mr. Lefevre.*) What experience have you yourself had in the matter?—What experience have I had?

20,576. Yes; I want to know how you arrive at the opinion you have expressed?—I know that what I have stated is correct, because I have been engaged in the business myself.

20,577. Have you been in a trawler lately?—Yes.

20,578. How recently?—Within the last three or four months.

20,579. And did you then find that you did not catch as much as you were in the habit of catching some years ago?—Nothing like it.

20,580. Did you observe that the falling-off was very great?—We did not get half the quantity. In point of fact there is not half the quantity of fish in the river now that there used to be formerly.

20,581. But I am talking of outside. Are there not as many fish taken outside as there were in former years?—Perhaps there may be outside; but if you take the whole of the coast along here, even including Aldborough Bay, you will find that there has been a very considerable falling-off in the quantity of fish. I do not see how it could be otherwise when I know the quantity that is killed and destroyed when quite young by fishing in the summer season.

20,582. We have heard elsewhere that there has been no decrease in the quantity of fish caught by the trawlers in the North Sea?—Why, God bless you, 40 years ago there were very few trawlers at all.

20,583. There are a great many more trawlers now than there were then?—Yes, there are more than double the number of trawlers now than there were then.

20,584. Do you mean that there are now double the number of trawlers belonging to Harwich?—No; I am not speaking of Harwich alone, but of trawlers altogether. At this time there are a good deal more than double the number of trawl-boats engaged in trawling compared with what there were 40 years ago.

20,585. You believe there are double the number of vessels engaged now in trawling that there were 40 years ago?—Yes, there has been all that increase; and I believe that in saying there are only double the number I do not go anything like far enough.

20,586. (*Mr. Caird.*) Do you speak of the trawlers engaged in supplying the London market?—Yes; I believe that at this moment you will find there are pretty well on to 300 sail of boats out of Barking alone, if there are not quite that number.

20,587. Three hundred sail of trawl-boats?—Yes.

20,588. I understood you to say, in reply to one of the questions put to you, that the number of trawlers engaged in supplying the London market had diminished?—No, I did not say that. I do not mean to say that the number engaged in supplying the London market has diminished, but what I mean is that the trawlers about here, and along this coast, and in the rivers here, have diminished. The same remark does not apply to the trawlers generally.

20,589. You do not wish us to understand that the trawlers who supply the London market have diminished in number?—No; of course there has been no decrease in those vessels. On the contrary they have greatly increased, and there are now double the number compared with what there was 40 years ago.

20,590. I understood you to say so?—I think you must have misapprehended what I said.

20,591. It was quite contrary to what we know to be the fact?—Yes.

20,592. Am I correct in drawing the conclusion, from your evidence, that you wish to make a distinction between trawlers for small fish and trawlers engaged in fishing in the deep sea?—The trawlers who are constantly engaged in fishing in the deep sea do not get as many small fish in the deep sea as those trawlers do who fish in the rivers.

20,593. Do you know from your own knowledge and experience that the trawlers engaged in fishing in the deep sea find a greater difficulty now in getting a good catch of fish than they did 10 or 15 years ago?—I think they do find a greater difficulty now than they did some years back. I have been told that frequently.

20,594. But can you speak to the fact from your own personal knowledge and experience?—No, I cannot.

20,595. Can you tell us whether during that time the price of fish has increased or diminished?—The price of fish has much increased at times.

20,596. It comes and goes; it fluctuates? Is that what you mean?—Yes.

20,597. But that is not what I want to know. Taking it on the average, would you say that for a year's catch a fisherman gets more money now than he was in the habit of receiving formerly?—I think the fishermen generally have received more money for their fish since the price of provisions has been so dear.

20,598. You think that fish have become dearer in consequence?—Yes, I think that they bring a greater price than they formerly did.

20,599. What was the kind of fish that was principally caught and brought into Harwich in former times?—There were soles, and fish of that kind.

20,600. Were there turbots as well as soles?—Yes; but we used to get that kind of fish when the Barking vessels were in the habit of putting into Harwich, before the custom sprung up of fitting out cutters to

accompany the fishing vessels to sea. These cutters are very fast-sailing vessels; they take the fish as soon as a cargo is caught, and they convey it direct to the market without bringing it here at all.

20,601. What are the kinds of fish that come here now?—The kinds that come here are just the same, and we have also cod-fish and lobsters.

20,602. Are there many turbots still brought here?—No; we never had any great quantity of turbots brought here at all.

20,603. Are the cod-fish which you say are brought here brought alive in well-smacks?—Yes, they are brought here alive in well-smacks, and they are put in machines.

20,604. Are they put in alive?—Yes.

20,605. Are they kept in the wells, or are they put into boxes and kept in the sea?—They have some boxes to keep them in, the same as they have to keep the lobsters in.

20,606. Are they kept in that way so that they may be available for the supply of the London market?—Yes.

20,607. Has that mode of keeping fish to supply the London market with regularity been on the increase here?—Yes, I think that it has been on the increase. I think there are more fish here now.

20,608. Do you think that the quantity of fish here has increased of late years?—Yes, I think there have been more fish here for the last two or three years than for some time previously, and I believe it has been owing in some measure to the mode which has been adopted for keeping the fish.

20,609. Are you aware whether the fact of steamers constantly coasting along the shore has had any injurious effect upon the supply of in-shore fish?—I do not think that it has.

20,610. You do not think that it has exercised any injurious effect?—No.

20,611. Then you do not attribute any of the diminution in the quantity of fish to the effect produced by steamers coasting along the shore?—No; because most of the steamers which pass here are vessels of a large draught of water, and they do not come in towards the shore as far as the small fish get in the summer season.

20,612. Is there any mode or plan that you could suggest by which the destruction of the in-shore fish could be put a stop to?—Yes, I think something might be done to prevent that.

20,613. What would you recommend?—Well, in my own mind, I think it very practicable to alter the "shale" or mesh of all the trawl-nets.

20,614. Do you mean the trawl-nets used in the shallow water, or the trawl-nets generally?—I mean the nets used in fishing in shallow water.

20,615. An alteration in the mesh of those nets is, in your opinion, desirable?—Yes, I would alter the "shale."

20,616. What effect would that produce?—It would enable the greater proportion, at least three parts, of the fish they now kill to get through the net, and find their way to the sea alive.

20,617. That would diminish the catch of the small fish?—Yes, it would diminish the catch of those small brood which are not fit to take. If the size of the mesh were enlarged they would get through without injury. They would then remain in the sea to grow up into large fish.

20,618. But how would the crab people get on in that case; they would have no bait, would they?—They could always contrive to get bait; there would be no difficulty in getting bait.

20,619. What other bait could they use?—They could use salt haddocks.

20,620. Is there any important crab fishery here?—I think there must be, and there are a great number of whelks caught here to supply the cod fishermen with bait.

20,621. Is the crab fishery here an important interest?—I cannot speak very much with regard to that. I am not often among the people to ascertain what quantity they have, but they must get a great deal. They must have a great number of bushels of crabs in the course of the season.

20,622. Do you know anything of the oyster fishery in this neighbourhood?—No; we have had no oyster fishery in this neighbourhood until within a very recent period.

20,623. How long have you had oysters here?—Only during the last six or eight months.

20,624. Have there been no oyster fisheries here in the rivers?—There used to be a few in Harwich harbour, and at the back of the cliff in Handford water. We had no regular fishery until the ground in the river was taken up recently and some oysters laid down. What they are going to do with them I cannot say.

20,625. (*Mr. Lefevre.*) Are you yourself engaged in fishing now?—No, I am not engaged in fishing now. I am getting too old.

20,626. What has been your experience with regard to fishing?—I have been engaged in every branch of fishing that is practised from the time I was 10 years old up to the present time, and I am now 76.

20,627. Have you been the owner of a smack?—I have had 14 or 15 smacks here at one time.

20,628. How many have you got now?—None. I used to have three or four vessels in the south seas.

20,629. When did you give up that business?—I have not been in business since 1855.

20,630. Did you find that it did not pay?—It paid me very well at the time I was engaged in the business. I retired from it only because I found I was getting too old for it.

20,631. Since the time you gave up your connexion with fishing smacks have you had no experience yourself with regard to the fishing?—I have had very little experience indeed since then.

20,632. Do you go fishing now sometimes?—Yes.

20,633. But you have no longer any interest in it?—I have no particular interest in it now, but I know very well what benefit might be done to it by taking strong measures and requiring the law to be observed.

20,634. Do the large trawlers trawl much off Harwich?—Oh dear no.

20,635. What distance from Harwich do they trawl?—I should say that the trawlers we are now talking about will none of them trawl nearer than about 40 or 45 miles off Harwich.

20,636. Did they ever trawl nearer than that?—Yes; there used to be vessels every year, when I was a lad 15 or 16 years of age, that were constantly in the habit of trawling off here.

20,637. Do they now go further off?—Those vessels trawled 24 or 25 miles off, and now vessels trawl at a distance of 70, 80, or 90 miles off here.

20,638. Do they find it more profitable to trawl further off?—Yes; they go further towards the coast of Holland and the German ocean.

20,639. Do they send in their fish direct?—A great many of them do.

20,640. They have vessels specially engaged in conveying the fish direct to the market?—Yes; they now have 20 sail of cutters, which have been built for the purpose of bringing the fish to market. They take the fish out of the trawlers, pack them in baskets, and pack them up in ice. They go direct to Billingsgate; but if the weather happens to be very bad, perhaps a chance one may put into Harwich.

20,641. Is there not a great deal of fish sent in by the trawlers now to Harwich?—I do not think there is; but I am not much here now.

20,642. Where do you live?—At Mistley, about 10 miles from here.

20,643. (*Mr. Caird.*) I think you spoke of shrimping here?—Yes.

20,644. Do you know, of your own knowledge, whether shrimping is extensively followed here?—I cannot tell you as much about that as people living at Harwich, but I believe that a great alteration is also required in the mesh of the nets used in shrimping.

The witness withdrew.

HARWICH.

H. E. Russell.

7 March 1864.

HENRY EDWARD RUSSELL called and examined.

20,645. (*Mr. Caird.*) I believe, Mr. Russell, that you have the management of the oyster bed recently formed in this neighbourhood?—I have.

20,646. How long is it since the breeding of oysters began to be tried here?—In August last.

20,647. Had there not previously been any oyster fishery or oyster bed in that quarter?—No, there had been none there before.

20,648. Is the bed you have formed near to the town?—The lower end of our ground is within about three miles of the town.

20,649. Is it in the river?—It is in the river.

20,650. Which river?—The river Stour.

20,651. What extent of oyster beds are you forming there?—Our limits are from Everton Ness to Stutton Ness.

20,652. What distance may that be?—It will be very nearly three miles; somewhere about that. You may say between three and four miles.

20,653. (*Mr. Lefevre.*) Do you hire the bed of the river on which you are forming your oyster fishery from the Crown?—Yes; we take it from the Crown.

20,654. (*Mr. Caird.*) Is it a Crown waste that you are working upon?—Yes, I believe so.

20,655. What steps have you taken to establish an oyster fishery there?—The first step we found it necessary to take was to clean the ground.

20,656. Were there any oysters there before you commenced your operations?—No.

20,657. Were there any shell-fish of any other description?—I believe that several small crabs were caught, such as the hammer crabs. I do not speak of the avil crabs; we got plenty of those.

20,658. When you had succeeded in clearing the ground what did you do?—We then laid down some oysters, or rather some halfware, for this season we could get no brood.

20,659. (*Mr. Lefevre.*) Was that because there was no brood last season?—Yes.

20,660. (*Mr. Caird.*) There has been no spat?—There has been a little, but it has been very little indeed.

20,661. When do you expect to get a return from your oyster beds?—That is a question I can scarcely answer. If we get a spat this season and the spat lives, we shall get a quick return.

20,662. When does the spat come?—Generally in the fall of the year—in the summer and the fall. There are two spats.

20,663. (*Mr. Lefevre.*) Have you laid down the oysters all below low water?—Yes. At the time of low water there are 18 feet of water on them in any part.

20,664. Eighteen feet of water?—Yes, from 15 to 18 feet.

20,665. I presume that you expect to have a spat there?—In all probability we shall be able to get one that will live. We are certain to get a spat next season. Every season there is a spat, but in some seasons the whole of the spat dies.

20,666. What reason do you assign for that?—The reason why it dies is to be attributed to the foulness of the ground. If it happens to fall upon foul ground it will die.

20,667. It has a much better chance if it falls upon clean ground?—If it falls upon clean ground it will in all probability live.

20,668. I suppose that the oysters are in too great a depth of water for the frost to affect them?—Yes, I think so, but that is a matter we have yet to ascertain.

20,669. (*Mr. Caird.*) That is a very important point, is it not?—Yes, very important.

20,670. Is there any fresh water mixed with the salt water which passes over the beds?—There is a considerable amount at times, but I do not apprehend that the freshes will at all interfere with the fishery.

20,671. You think there is not too much, so as to be injurious to the prospect of forming a good oyster bed?—I myself do not think there is, but that is a point we have still to ascertain.

20,672. Is the bed placed in similar circumstances to other oyster beds further up the Thames which have been found to succeed?—It has been formed on the same principle as those in the Thames which have been successful.

20,673. In the beds you are endeavouring to establish, are you, as much as possible, following the plan adopted in the oyster fisheries in the Thames?—Only to a certain extent.

20,674. You know the principle which they adopt?—Yes, we thoroughly understand the nature of those fisheries, and we know perfectly well how they go to work, but we do not follow their principle exactly.

20,675. In what respect do you differ from them?—Our plan is different from that adopted at Whitstable or Colchester. We do not pit ours as they do in Colchester river and on Whitstable flats, nor are they caught every year and pitted the same as at Colchester, because we have a greater depth of water and not so much fresh water.

20,676. (*Mr. Lefevre.*) Are there no natural oysters in the Stour or in the Orwell?—With regard to the Orwell I cannot give you any information.

20,677. Are there any in the Stour?—No, very few indeed. We caught about a couple of score while we were engaged in cleaning the ground. That was the most I saw all the time we were at work.

20,678. How long were you at work?—We were engaged with 14 or 15 sail of boats for six or eight weeks in cleaning the ground.

20,679. Has there been no dredging for oysters in the Stour?—Not so far up as our bed is placed. They seldom dredge above Shottley.

20,680. Then they do dredge for oysters in the river?—I cannot say whether they do so now or not. In the harbour they do, but not far up.

20,681. Have they dredged as high up as the beds you have laid down?—I do not think they have. They seldom or ever go above Shottley.

20,682. What size were the oysters you laid down this year?—I think the smallest of them would be about $1\frac{1}{2}$ inches over.

20,683. Where do you get them from?—We get them from Ireland now.

20,684. How many did you lay down last autumn?—I can scarcely tell you; I do not know myself, but I could soon ascertain.

20,685. Did you lay down any large number?—We laid down as many as we could get. It is very difficult to get them now; we cannot get oysters fit to lay down for any money. There are none to be had; they are all full-sized oysters.

20,686. What means do you take to prevent other people from dredging there?—We have given regular notice that there are fisheries being established in the river. I have a printed form with me now.

20,687. What expectation have you that you will prevent people from dredging there?—We have given them full notice in the public journals, and printed notices have been given to the fishermen in the river, so as to warn them that there are preserved beds.

20,688. Is it a London company by whom the beds have been formed?—No, it is not a company at all.

20,689. It has been done privately?—Yes.

20,690. Who is the gentleman who is the lessee?—Mr. Michael Wills.

20,691. (*Mr. Caird.*) He holds under a Crown lease, which gives him an exclusive right to have oysters on that bed and to fish for them?—Yes.

20,692. The Crown right gives him that privilege exclusively?—Yes.

20,693. Do you know what he pays for it?—I do not know what he pays for it.

20,694. (*Mr. Lefevre.*) Is there much other ground besides this oyster bed you speak of fit for oysters?—Yes, from the lower part of our ground down to Shottley.

20,695. Is that ground that has been dredged over?—Yes, it has been dredged as far as Shottley. I have no doubt that the Crown has a title to it down as far as Shottley. The boats seldom dredge above that.

20,696. Is it suitable for breeding all over there?—Yes, it would be after it has been cleaned; it is rather dirty at present.

20,697. Have the oysters decreased in quantity there of late years?—Yes, they have decreased wonderfully.

20,698. To what is that decrease due?—My own opinion, with regard to the reason why there has been so great a decrease, is that it is caused by the closing of the season for a part of the year.

20,699. How does that affect the oyster fisheries?—When the season is closed it allows the ground to become foul.

20,700. What do you mean by the season being closed?—During a certain portion of the year the fishing is prohibited. An Act of Parliament was passed hindering the fishermen from dredging all the year round, and the result has been that the ground has become foul and the oysters have been destroyed. In former years, before that Act of Parliament came in force, and when the fishermen were allowed to dredge all the year round, there was never any scarcity of oysters.

20,701. Then I gather from the statement you have just made that you think the regulation as to a close season is a bad one?—Yes, I certainly think so. Oysters were always plentiful before that regulation was established.

20,702. Do you mean that more good was done by dredging the ground than by leaving the oysters free from dredging?—Exactly, and I think we have had plenty of proof of that in the oyster fisheries in Jersey and other places. In those fisheries, perhaps a little longer back than I can remember, but within the recollection of many persons now living, there used to be plenty of oysters, and there are none now.

20,703. The oyster fisheries in the places to which you refer have very much fallen off of late years?—Yes, very much; so much has that been the case in Jersey that from that place, where the fisheries at one period were very extensive, the Jerseymen have been obliged to seek a living on other parts of the coast.

20,704. Has that change taken place since the establishment by Act of Parliament of close time?—Yes, I believe it has. The result of the absence of dredging during the close season has been that the ground has what we call "swarbed," and become covered over with "slub" and one thing or another.

20,705. That has all arisen in consequence of the ground not being worked?—Yes.

20,706. And in your opinion has that had a tendency to prevent the oysters from breeding?—Yes, I am convinced that it has, and that it is the real cause of the decrease which has taken place in the quantity of oysters. There was never any scarcity before that regulation came into force, and there has been a constant diminution in the supply ever since.

20,707. Is there anybody here who can give us any information with regard to what the supply was in former years before a close time was established?—Yes, I believe there are persons present who can give you all the information you require.

20,708. (*Mr. Caird.*) How long, under the Act of Parliament to which you refer, is the ground closed and the fishermen prohibited from fishing the oyster beds?—The season closes on the 1st of May.

20,709. And when does it commence again?—It closes on the 1st of May and opens again on the 1st of September.

20,710. Then during the intervening months there is no dredging?—There is no dredging during May, June, July, and August.

20,711. And you say the result of that is to injure the oyster beds?—Yes.

20,712. In what way do they become injured?—The ground fouls in consequence of being left open.

20,713. The ground gets covered?—Yes.

20,714. What does it get covered with?—With "slub," and wood, and mud, and all that sort of thing.

20,715. Do the oysters get covered with it?—Yes, and they become smothered and destroyed.

20,716. The oysters perish in consequence of that?—Yes, and not only that, but when the spat falls, instead of falling upon stones or upon shells, or upon anything to which it would adhere and live, it falls into the mud and "slub" which have become deposited there and dies.

20,717. Then, in your opinion, if the fishermen were permitted to dredge for oysters all the year round it would prevent the accumulation of "slub?"—Yes, certainly it would.

20,718. But if you have no close time, and allow dredging to go on all the year round, would you not in the course of time entirely remove the whole of the oysters?—I think there is very little danger of that.

20,719. What makes you think so?—Why, see for how many hundreds of years people have dredged before this Act of Parliament came in vogue, and yet there was never any scarcity.

20,720. Is the ground rough so that the dredge cannot remove every oyster?—Yes, it is rough to a certain extent; but there are other things besides the roughness of the ground which would prevent the beds from becoming entirely exhausted.

20,721. What is there besides that would operate as a protection to the beds?—If the men were constantly at work they would never dredge the ground clean. If you had a fleet of boats working for any length of time on the same piece of ground they would not succeed in catching every oyster. You would find that they must leave some, and those they left would be sufficient for breeding and replenishing the ground.

20,722. (*Mr. Lefevre.*) A very few oysters would supply spat enough to stock the beds?—Yes. If the ground were thoroughly cleaned from all mud and slub, as soon as the oysters spat the spat would fall upon the clean ground and in all probability would live.

20,723. (*Mr. Caird.*) But if you were engaged in dredging during the whole of a season would you not destroy the spat?—No, because the spat adheres to the stones; there is no fear of destroying it. If I were to show you spat when first it becomes spat, you would find that it is no larger than my nail. It has just the same appearance as if you were to take a wax candle and drop the melted wax upon a stone. I have never seen it on the surface.

20,724. Does it fall down and adhere to the stones?—Yes, it adheres to the stones and shells at the bottom.

20,725. (*Mr. Lefevre.*) It swims about for a short time when quite young, does it not?—You have probably seen oysters full of stuff like milk; that is the spawn or spat. It flows out of the mouth. Some people say that as soon as it leaves the shell it rises to the surface; I rather incline to think that it does not rise to a greater height than from six to 14 feet above the level of the ground.

20,726. Does it float there?—Yes, for a little while, and then it falls. As soon as it falls it adheres to anything it falls in with. If it falls on the rock and stone it adheres there until it becomes oysters, and remains until it is knocked off. If it were to fall clear of anything of that sort into the mud, where it has nothing to adhere to it, or into the slub I told you of, it would die.

20,727. (*Mr. Caird.*) On the bed you formed in the Stour you say that you cleaned the ground before you laid the oysters down?—Certainly.

20,728. Did you make the ground quite smooth?—The bottom of the river is nearly smooth.

20,729. Is it not a stony bottom?—It is like a gravelly beach composed of shingle.

HARWICH.

H. E. Russell.

7 March 1864.

20,730. Is it such a smooth bottom that by constant dredging you would pick up every oyster laid there ?—It is as smooth as a garden path that has been gravelled or as a shingle beach.

20,731. Could you not by continual dredging lift up every oyster lying there ?—No, I do not think we could.

20,732. How could they escape on so smooth a bottom ?—If you were to dredge day after day you might suppose that you were constantly dredging in the same straight line, but in all probability you would always dredge a few feet out of the line. You might dredge over a piece of ground no larger than this room for a hundred times and yet you would miss an oyster or two here and there.

20,733. And if only a few were left would they be quite sufficient to give spat enough for keeping up a plentiful supply of brood ?—Yes, and up to within a few years past the men employed in dredging for oysters would not take away the very small stuff. Now unfortunately they do, but it is only because they are compelled to do so by the scarcity of anything else.

20,734. You mean that if they brought up very small oysters to the surface in the dredge they would put them back again ?—Yes, because they could not get a market for it; but now it is very different, because oysters are so scarce that they will take anything, and by so doing they have diminished the oyster fisheries to a very great extent.

20,735. You spoke of Jersey just now ?—Yes.

20,736. What experience have you had of oyster fishing on different parts of the coast ?—I have never been in Jersey during the oyster season myself; but I have often been with those who have been there, and I have heard them talk a good deal about it. I therefore know for a fact, from knowing Jerseymen and Jersey people, that, instead of dredging on their own ground now, they go now to Carnarvon, Cornwall, the lower part of Scotland, the Firth of Forth, and the Humber, dredging.

20,737. When the time comes round when they may legally fish again, do not they go back to their own ground and fish as they used to do ?—No. This last season they tried their own ground and found that they could not catch enough to pay them. They were therefore obliged to seek for oysters in other places.

20,738. Was it proved that the ground had become foul in consequence of the cessation of dredging, and that all the oysters had disappeared ?—Yes; that is a well-known fact among fishermen.

20,739. Is it the general opinion of the oyster fishermen that the establishment of a close time has proved injurious to themselves by decreasing the quantity of fish ?—Yes, I believe it is.

20,740. Can you tell us where the chief oyster beds that supply the London market are to be found ?—No doubt the chief beds are on the Kentish and Essex coasts.

20,741. Does the same rule apply there as to Jersey and the other grounds to which you refer ?—It would not answer on the Whitstable ground; if they did the same there as in the channel and on the public grounds, they would not have an oyster to send to the market. In the course of three years their ground would so fall off that every oyster would die.

20,742. Do they work their grounds all the year through ?—Yes.

20,743. Does not the law apply to them ?—No; their season is all the year through. They are constantly catching the oysters and moving them and shifting them from one part of the ground to another.

20,744. The law permits that although it will not permit them to be taken to the market and sold ?—Yes.

20,745. Could not the Jerseymen do the same thing ?—If they are caught in the Channel with dredges their dredges are taken away from them. The law will not allow them to go into the Channel with dredges after the season is closed.

20,746. Do you know whether there is a different law applicable to the oyster beds in the Thames from that which applies to the beds in the Channel ?—Yes, there is a different law.

20,747. (*Mr. Lefevre.*) The oysters on the beds in the Thames are private property, are they not ?—Yes.

20,748. And the beds outside are public property ?—Yes.

20,749. Have you laid down stones or anything of that sort on the bottom of your beds ?—No; we have laid down no stones.

20,750. Is the bottom of the river strong enough for the purposes of spat ?—Yes, the bottom is shingly.

20,751. Then what you have done has been to remove the mud and scum ?—Yes. There was not much mud, but we set to work to clear the ground of slub and weeds.

20,752. Did you not, in the process of clearing the ground, bring up a great many stones ?—There are only very few large ones to bring up.

20,753. Then the ground is quite shingly ?—Yes, just the same as it is on Landguard beach. In some places there may be a little hard clay.

20,754. Have you been continuing the dredging up to the present time ?—We are not engaged in dredging the bed now, but we are stocking it. We first clean it, and then stock it.

20,755. Have you observed whether the oysters have grown much since they have been laid down ?—They do not grow much at this season of the year; they may fatten a little, but there is not much alteration in the oysters in the winter season.

20,756. The growth takes place principally in the summer ?—Yes.

20,757. How long does it take before the oysters are fit to send to the market ?—Some of them will be fit for the market next fall, as soon as the season begins again in August for the London market.

20,758. What did you pay for the small oysters you laid down ?—I can scarcely tell you what we paid.

20,759. Can you tell me something to convey an idea of the price ?—We paid 15*s.* 2*d.* a wash for native brood and halfware, and as high as 7*s.* and 7*s.* 6*d.* per tub for channels.

20,760. Do the channels not turn out as good as the natives ?—No, they fetch very inferior prices.

20,761. But the spat of the channel oysters, how does it turn out ?—The spat of the channel oyster and of every other oyster on this ground is equal to a native; there is no difference at all.

20,762. But if you were to lay down the young of the channel oysters brought from a distance, would they at the end of two years produce as good oysters as the natives ?—No, certainly not. If we were to bring young channel oysters they would still remain channels, and they grow up to be channel oysters just the same as if they were in the Channel; but, nevertheless, the spat of that oyster, either in the Stour or in any other river, will become a native oyster, and will not appear at all like a channel oyster next season.

20,763. I suppose the channel oyster, if placed in the river, would improve more than if it was left in the sea ?—Yes; the salt rank taste the channel oysters have is entirely taken away after they have been laid down upon our river beds.

20,764. Do you know anything of oyster fishing in the Orwell ?—No.

20,765. Is there any oyster fishery in the river Deben ?—Is that the Woodbridge river ?

20,765*a*. Yes.—There is no fishery there.

20,766. Is there any in the Handford water ?—That is a public fishery.

20,767. Is there any large number of oysters there ?—There has been; and that is a proof of the truth of what I have been saying, namely, that in one season, when the season was open all the year round for catching oysters, they could never catch all the

oysters that were in that place; now there are so few that they cannot catch enough to make a living.

20,768. Do you speak from your own experience, or from what you have heard?—I speak from what I have heard. I have not been long enough on this coast to know much about it personally.

20,769. Is there anybody here who knows anything about the Handford fishery?—Yes, I think there is.

The witness withdrew.

William Groom called and examined.

22,770. (*Mr. Caird.*) Have you had much experience in connexion with the fishing interest at Harwich?—I am a smack owner here.

20,771. Can you inform us whether, within your experience and knowledge, the supply of fish brought into Harwich for the London market or otherwise has increased or diminished?—I believe the supply has increased.

20,772. Is the number of vessels employed in the various kinds of fishing here increasing or diminishing?—The number is increasing.

20,773. What kind of fishing is chiefly carried on here?—The cod fishery.

20,774. Is that by line-fishing?—Yes, line-fishing.

20,775. Is it carried on by what are called well-smacks?—Yes.

20,776. How many of those well-smacks are there which come into Harwich as a general rule?—I can hardly tell the exact number.

20,777. What is the average number; that will be near enough?—I should think that the average number will be about 25 a week.

20,778. About 25 a week?—Yes, about that number.

20,779. Can you compare that with what the number was five or 10 years ago?—There are decidedly more now.

20,780. And is the number increasing from year to year?—Yes; there has been a decided increase since the railway came here.

20,781. (*Mr. Lefevre.*) Do the boats of which you speak mostly belong to Harwich, or do they come from other places?—They belong to Greenwich principally.

20,782. (*Mr. Caird.*) Have you stores here in which to keep the fish alive after they are taken out of the wells of the vessels?—Yes.

20,783. Are they put in boxes and kept in the salt water?—Yes.

20,784. And by that means the London market is supplied gradually as required?—Well, sometimes that is so.

20,785. Is there always a supply of fish kept in store here in that way?—Yes, nearly always.

20,786. Has the fishing business here been an increasingly lucrative one?—I think it has.

20,787. The people who have been connected with it have generally found it to be a paying business?—Yes, I believe so.

20,788. Do the smacks that bring the fish here go to some considerable distance out at sea for the fish they catch?—Yes.

20,789. Where do they go to?—To the Dogger Bank principally.

20,790. Then they fish on the same fishing grounds as the Barking and Grimsby vessels?—Yes, precisely the same.

20,791. I presume they are the same class of vessels?—Yes, they are the same class of vessels.

20,792. Where do they get their bait?—From the rivers here round about the mouth of the Thames.

20,793. Are you aware whether any of the fishing grounds they frequent have shown any signs of diminishing in their yield of fish?—No, I think not.

20,794. Do you think the yield has increased?—It has rather increased, I think.

20,795. Then, from what you say, your experience agrees with that of those who have told us that the more vessels have been fishing upon the fishing grounds the more rapidly the supply of fish has appeared to increase?—Yes, I believe that is quite correct. It certainly appears that the fish increase the more they are fished.

20,796. There has been no diminution of a marked character that you are aware of on any of the principal fishing grounds off this coast?—None, whatever. I think, however, that they have decreased just off this harbour.

20,797. Do any of your vessels fish off the harbour here?—No, not at this time of the year. They go further out.

20,798. (*Mr. Lefevre.*) To what distance off the coast do they go?—Perhaps 20 miles from Orford Ness.

20,799. (*Mr. Caird.*) What kind of fish do they get?—They catch cod-fish.

20,800. Are they making better catches now than they were in the habit of making in former years?—Yes, they have been making better catches within the last two or three years.

20,801. Are the cod-fish they get now as good in size as they caught formerly?—Yes.

20,802. And are they as fine in quality?—Yes, decidedly.

20,803. Are there any trawled fish brought here from the deep sea?—Only very few. Sometimes there are a few brought in by chance.

20,804. Did you hear the evidence of a previous witness, who told us that the in-shore fishing has decreased in consequence of the practice of trawling in the rivers and the destruction of the brood?—No, I did not.

20,805. Does your experience lead you to the same conclusion?—No, I think not. I can hardly agree with that.

20,806. Do you find that the in-shore fishing is as good as it used to be?—Yes, as to cod-fish.

20,807. Is there any other kind of fish caught by the line here?—No.

20,808. Turbot, for instance?—No.

20,809. Turbot are not caught here by the line?—No. Off Cromer turbot and halibut are caught, but there are none round about this neighbourhood.

20,810. (*Mr. Lefevre.*) Is there any considerable fishing population here?—No, not with regard to the cod fishery.

20,811. Do the men who engage in the fisheries from here go from Harwich or from Barking?—They go from Harwich, Greenwich, Barking, and other places.

20,812. What is the number of fishermen living in Harwich?—I cannot give you the exact number.

20,813. About how many are there?—About 50, I think.

20,814. Has the number increased of late years, or has it remained stationary?—It has increased very little.

20,815. Are they fishermen who are mostly engaged in smacks that go out to a distance, or are they engaged in trawling in the river?—They go out to sea.

20,816. Do you know what is the number of men engaged in trawling in the river?—No, I do not.

20,817. Is trawling in the river quite a small trade?—Yes, it is a very small trade, I think.

20,818. There are only very few smacks engaged in it?—Yes, very few.

20,819. And those are small ones?—Yes.

20,820. How many smacks do you own yourself?—I have three.

20,821. Do they hail from Harwich?—Yes.

20,822. What is their tonnage?—They average between 50 and 60 tons register.

20,823. How many men are there in each of them?—Ten.

20,824. What wages do you pay the men?—1*l.* a week.

HARWICH.

W. Groom.

7 March 1864.

20,825. Have they any share in the catch?—The men have no share in it.

20,826. Has the master?—Yes.

20,827. What does he get?—The master gets five per cent.

20,828. Is there any herring fishery off here?—No, we have no herring fishery.

20,829. I suppose that when the herrings are off here the boats follow them from Yarmouth and Lowestoft?—Yes.

20,830. Are there no herring boats belonging to Harwich?—No, none.

20,831. Is there much shrimp fishing practised here?—Yes, there is a great shrimp fishery here.

20,832. Where is it practised; mostly in the river or outside?—Outside.

20,833. Do you know how many boats are engaged in it?—I should think that in the course of the season there are at least 60 sail engaged in it.

20,834. I suppose there are two or three men in each boat?—There are two in each.

20,835. What do they catch them with; do they use a small trawl?—Yes, a small trawl.

20,836. Do they take other small fish at the same time?—Yes.

20,837. What sort of fish?—Small flat fish.

20,838. Has that description of fishing fallen off of late or not?—No, I think not.

20,839. Do you hear of any complaints from the fishermen of the destruction and injury committed by that kind of fishing?—No, I never hear of any complaints.

20,840. Do the men who are engaged in it belong mostly to Harwich?—No, I think not; only a few of them belong to Harwich.

20,841. Where do they come from?—Mostly from Lea.

20,842. Lea in Essex?—Yes.

20,843. They come up here from Lea?—Yes.

20,844. They are not men who belong to Harwich itself?—No; there are only a few men here who engage in that fishing.

20,845. How many boats belonging to Harwich are engaged in it?—There are only 10 boats here, I think.

20,846. What is the shrimp season here?—From May to August.

20,847. Do they follow the shrimps up here from Lea; do the seasons vary on different parts of the coast?—No, I think not. I believe that the shrimps caught here are a different description from those caught at Lea.

20,848. In what does the difference consist?—Those caught here are a red shrimp, while those caught at Lea are a brown shrimp.

20,849. Are the shrimps landed here every day?—Yes.

20,850. And sent forward to London?—Yes.

20,851. Is there a considerable quantity of shrimps sent up from here to London in the course of the season?—Yes, a very great quantity.

20,852. Has the quantity increased or decreased of late years?—It has increased.

20,853. Has it increased much?—Yes.

20,854. Is there any considerable lobster fishery here?—We import them from Norway.

20,855. But is there any considerable lobster fishery on the coast itself?—There are a few, but they are not caught to any great extent.

20,856. I suppose the ground off here is not rocky enough for them?—There are plenty of rocks just outside.

20,857. (*Mr. Caird.*) Is that along the Suffolk coast as well as the coast of Essex?—There are lobsters along Orford Ness and the Orwell.

20,858. Is there a valuable lobster fishery there?—No; it is only a small fishery.

20,859. (*Mr. Lefevre.*) Is there any fishery at Woodbridge?—There are a few lobsters there.

20,860. Are there many fishing boats there?—No.

20,861. How many are there?—There are not more than 20 persons engaged in fishing there.

20,862. South of Harwich, what fishing places are there?—There are none of any importance.

20,863. Is there any fishing station at Handford?—No.

20,864. Is there anything in the Blackwater or at Maldon?—I believe not.

20,865. (*Mr. Caird.*) Is there a large importation of fresh lobsters into Harwich?—Yes; we import a great many during the season.

20,866. Where from?—From Norway.

20,867-8. Can you give us any information as to what the quantity may be?—Yes. I have a return here which states what the number imported has been for some years.

20,869. Will you be good enough to hand it in?

Witness put in the following return:

The Number of Lobsters imported by us from the Coast of Norway from 1827 to 1863, both inclusive.

1827	259,992	1846	57,582
1828	269,837	1847	33,719
1829	177,568	1848	51,391
1830	233,090	1849	40,367
1831	129,512	1850	59,292
1832	71,810	1851	73,965
1833	87,716	1852	91,466
1834	71,596	1853	140,735
1835	95,204	1854	97,664
1836	87,777	1855	154,700
1837	79,205	1856	225,463
1838	79,712	1857	138,107
1839	56,144	1858	72,822
1840	62,354	1859	209,832
1841	62,957	1860	303,600
1842	62,906	1861	245,125
1843	65,828	1862	235,585
1844	58,563	1863	231,221
1845	80,826		

20,870. (*Mr. Lefevre.*) Are the fish boiled when they are brought here?—They are boiled on board the boats.

20,871. I see on looking over the returns you have handed in that it extends from 1827 down to the year 1863?—Yes.

23,872. Does it embrace the number of lobsters imported from the coast of Norway by you yourself?—Yes.

20,873. Does it represent the whole quantity imported into Harwich?—Yes.

20,874. Does nobody else import lobsters here?—No.

20,875. Then the return gives the whole quantity imported into Harwich from Norway?—Yes.

20,876. The number imported seems to have decreased from 259,000 in the year 1827 down to 56,000 in the year 1839, 33,000 in 1847, and now they have got to 231,000. Of late years the importation seems to have been quite as great as it was formerly?—Yes, and it continues to be so up to the present time.

20,877. The importation from Norway is quite as great as in former years?—Yes, quite as great.

20,878. It is not diminishing?—No.

20,879. During the last three or four years it has made a considerable increase over the ten years previously?—Yes.

20,880. You have put in the return as a correct return of the quantity?—Yes, and I wish also to put a further document in in reference to the cod fishery.

20,881. What is it?—It is a statement as to the cod-fisheries left by my father. He died the year before last, and I believe he gives in this paper a history of the fishing from Harwich.

The witness handed in the following document:

The North Sea Cod Fishery from Harwich, &c.

In the year 1712, at Harwich, a seaport in Essex, welled smacks were first constructed, suitable for fishing in the North Sea for cod-fish, &c; and between that year and the year 1715 three vessels of that description were built, but

very inferior to those which were afterwards constructed. In the year 1720 the number had increased to 12, and in 1735 to 30. Of that number Mr. Nathaniel Saunders (the progenitor of the three generations of the celebrated fish factors and salesmen at Billingsgate) had six, and with four of these, which were very superior to the other two, he visited the coast of Scotland in the course of his fishing expeditions, and was at that time the chief medium for conveying goods to and from the North of Scotland. In the year 1745 his four smacks were engaged by the Government to carry the loyalist troops across the Moray Firth from Mickle Ferry to Inverness, from which place they proceeded to the memorable battle of Culloden. In 1766 a Mr. Olibar, a fishing smack owner at Harwich, made the first attempt to fish for cod with long lines on the Dogger Bank, but although he was very unsuccessful, he still persevered, and was so fortunate that in 1774 the number of smacks had increased to 62, of which 40 went regularly to the Dogger Bank to fish with long lines. In 1788 there were 78 smacks, and in 1798 the number had increased to 96. About this period a few attempts were made at Gravesend, Greenwich, and Barking to construct smacks of a similar description, and the Harwich fishery gradually declined. At the present time there are only five welled smacks sailing from that port. There are ten from Aldborough, 15 from Grimsby, 37 from Greenwich, four from Deptford, ten from Gravesend, and about 180 from Barking. The following table shows the number of welled smacks, the amount of tonnage, and the number of men employed in codding from these places:—

—	No. of Smacks.	Tonnage.	No. of Men.
Harwich - -	5	300	50
Aldborough - -	10	500	90
Greenwich and Deptford	41	2,066	369
Gravesend - -	10	600	60
Grimsby - -	14	900	130
Barking - -	180	10,800	1,620
Total - -	260	15,166	2,319

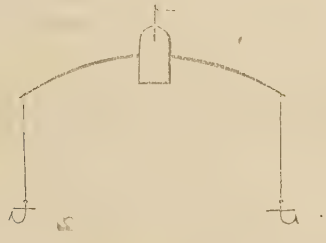
Of the Barking smacks 40 are employed in cod fishing, six in haddock fishing, and the remainder in trawl fishing. Besides these there are a large number of what are called dry-bottomed vessels, viz. smacks built without wells, employed in trawl-fishing in the North Sea, the tonnage and the number of men nearly equalling that of the welled smacks. The fish caught by these vessels consist of cod, ling, halibut, haddock, skate, soles, plaice, thornback, turbot, brill, and numerous other species.

The following statement, showing the number of fish brought to London, was published in the "Morning Chronicle" on the 12th Dec. 1850:—

An Account of the Number of Fish Sold in Billingsgate Market during 12 Months.

Salmon - -	29,000	boxes, 7 in a box - -	203,000 salmon.
Live cod - -	400,000	averaging 10 lbs. each - -	4,000,000 lbs. of cod.
Barrelled cod -	15,000	barrels, 50 in a barrel - -	750,000 codfish.
Salt cod - -	1,600,000	averaging 5 lbs. each - -	8,000,000 lbs. of cod.
Fresh haddocks -	2,250	tons, averaging 2 lbs. each -	2,470,000 fresh haddocks.
Smoked haddocks -	65,000	barrels, 300 in a barrel -	19,500,000 smoked haddocks.
Soles - -	12,000	tons, averaging ¼ lb. each -	97,520,000 soles.
Mackerel - -	10,500	tons, averaging 1 lb. each -	23,620,000 mackerel.
Fresh herrings -	250,000	barrels, 130 in a barrel -	33,375,000 fresh herrings.
Red herrings -	100,000	barrels, 500 in a barrel -	50,000,000 red herrings.
Bloaters - -	265,000	baskets, 150 in a basket -	147,000,000 bloaters.
Eels - -	729	tons, 6 to a lb. - - -	9,797,760 eels.
Whitings - -	3,000	tons, averaging 6 ozs. each -	17,900,000 whiting.
Plaice - -	15,000	tons, averaging 1 lb. each -	36,600,000 plaice.
Turbot - -	2,500	tons, 2 lbs. to 16 lbs. each -	800,000 turbot.
Brill and mullet -	1,500	tons, averaging 3 lbs. each -	1,220,000 brill and mullet.
Oysters - -	309,935	bushels, 400 to a peck - -	495,896,000 oysters.
Lobsters - -	- - - - - -	- -	1,200,000 lobsters.
Crabs - -	- - - - - -	- -	600,000 crabs.
Prawns - -	192,295	gallons - - -	498,423,628 prawns.
		Total number of fish - -	1,448,875,388

The time for cod-fishing is from May to the middle of October, and the line employed is a hand-line 2 lbs. to 35 fathoms, with a chopstick and a leaden sinker weight from 3½ lbs. to 4½ lbs., with about 30 inches of iron wire ¼ of an inch thick through the lead and snoods, and hooks attached, thus—



The line is fastened to the lead. The piece of wire across the upper part of the hook is to prevent the fish from swallowing the hook and being killed. Haddocks and whiting are caught in the same manner but with smaller gear.

The cod are caught during the above months at Iceland, Shetland, Butt of Lewis Islands, Fleman Isles, Barra and Rona, Cape Rock off Cape Wrath, Stack and Skerry, North Isles of Orkney, and Pentland Firth, off Ratrie Brigs, Marr Bank, Fern Islands, and the shoal grounds lying off the Humber from within sight of land to a distance of 30 or 40 miles.

The fishing grounds for haddock are near the N.N.E. Hole, deep water of the Well Bank, and deep water N.E. part of the Well Bank, called by fishermen Botany.

Whiting are caught off the edge of the Channel, off Lowestoft, Southwold, &c.

The trawling grounds for soles, turbot, brill and plaice are about Smiths Knoll, the great Silver Pits, the Brown Bank, &c.

The long-line fishing begins about November along near the land in thick water, as off the land in clear water the dog-fish eat the cod-fish very quickly when caught by the hook and confined. About December the smacks proceed to the Dogger Bank, and in moderate weather some of them will lay out lines for a distance of 12 miles, having a buoy with a flag at every mile, and at every nine feet a hook on a snood about 20 inches long fastened to the long line. When the lines are hauled in the cod-fish are lanced to let the air out of the sound or air vessel, which is so distended with air during their struggles whilst being hauled up, that they cannot go below the surface, but lay on the water belly upward, and would die unless lanced to free them from the pressure of the air.

The fish that are killed by the violent motion of the smacks in bad weather are taken out every day and salted. Those that live are taken to Gravesend and other places which have railway communication with London at the latest hour to save the market. The cod are taken out of the well and beaten about the head until they are quite dead, and they will crimp as well after they have been dead several hours as if they were alive.

The habits of fishermen are much altered for the better, but still there is great room for improvement.

The masters in the cod fishery get 12*s.* per week and five per cent. on the earnings of vessels. Some of them get a little more. The men get from 13*s.* to 15*s.* per week; the mates from 14*s.* to 18*s.* per week; the apprentices according to their servitude from 4*l.* to 8*l.* and 10*l.* per annum, and some even more besides perquisites.

There are no particular charities or schools exclusively for fishermen and their children. There are savings banks and national schools in all fishing towns.

HARWICH.

W. Groom.

7 March 1864.

The bait used for cod-fishing is whelks. Each vessel takes about 40 wash per voyage. A wash measure should hold 22 quarts and a pint of water. Haddocks and whitings are caught by means of mussel baits. The lines are coiled and hooks baited in trays and laid clear for running, from 480 to 640 fathoms in a tray.

On the Dogger the smacks fish in from 12 to 15 fathoms in December; in from 14 to 17 and 18 fathoms in January; and in 18 to 22 fathoms in February. In March they fish in shoal water, mostly in 10 to 12 fathoms. Latitude 54° 16′ to 55° 30′; longitude 3° to 3° 30′.

20,882. Do you find that you lose many of your lines in consequence of the trawlers coming in contact with you?—Not many from our own men, but we have lost a good deal by the French fishermen who come off the coast here.

20,883. Do you mean the French trawlers?—Yes.

20,884. What injury do they do to you?—They take away the lines and steal the buoys.

20,885. Does your loss in that way form any considerable item in your expenditure?—I should think that it must.

20,886. What are your lines; are they long lines?—Yes, they are long lines.

20,887. They are not hand lines?—In some part of the year we use hand lines.

20,888. What part of the year?—In the autumn.

20,889. What length are the long lines you use?—They shoot about 12 miles of lines I believe.

20,890. How many hooks are there to them?—I cannot tell you; I should think about 10,000.

20,891. Are they fastened to a buoy at one end?—There are seven or eight buoys attached to them.

20,892. Are they anchored?—Each buoy has an anchor.

20,893. Then I suppose that it will take a whole day to take them up and remove the fish from them?—Yes.

20,894. Are they set down again at night?—They are shot out in the morning and hauled in at night.

20,895. Do you leave them out in the water during the night?—No, they are only out during the day, and are taken in at night.

20,896. Then cannot you see what boats go over them and take them away?—Yes, we may probably see a boat go over them, but probably the smack will be 12 miles distant from the further end of the line, and by the time we can get up to the place they are all gone.

20,897. If you could get the number of the vessel injuring the lines you have a remedy, have you not?—Yes.

20,898. Have you any complaints to make against the English trawlers?—No, none whatever.

20,899. Do they not fish on the same ground?—Yes, but I do not think they injure our lines.

20,900. How is that?—They go over them.

20,901. They go over your lines without injuring them?—Yes; by chance they happen to catch a hook and then it breaks off.

20,902. The hooks are attached to the principal line you use by smaller lines?—Yes.

20,903. And those smaller lines will break sooner than the large one?—Yes.

20,904. One is much stronger than the other?—Yes, very much so.

20,905. You never lose the large line then in consequence of having it caught by English trawl vessels?—No.

20,906. Where do you mostly fish with the long line?—Off the Dogger Bank and Cromer.

20,907. What time of the year do you take to the hand line?—From July to September.

20,908. That line trails on the ground I suppose?—No, it is laid from the vessel down to the bottom of the sea.

20,909. But the bait touches the ground does it not?—Yes.

20,910. What is it that makes you give up the long line and resort to the hand line?—During the hand-line season the fish are all flying about after the herrings, or rather the herring spawn. The long lines are used when the fish are feeding on the ground.

20,911. But if you use the hand line the bait is on the ground, is it not?—Not always. We find by casting in the line where the fish are and how far distant they are down in the water. They are not exactly on the ground, but they may be four or five fathoms from the bottom.

20,912. You ascertain that by trying for fish?—Yes.

20,913. Having found the depth they are in you fish accordingly?—Yes.

20,914. The fish you wish to catch are after other fish at the time?—Yes.

20,915. (*Mr. Caird.*) When was the paper you have handed in written by your father?—In 1852.

20,916. Had he had a long experience connected with the fisheries here?—Yes.

20,917. I see he refers to the wages paid at that time to the masters and fishermen. The masters, he says, in the cod fishery got 12*s.* per week and five per cent. out of the earnings of the vessel?—Yes, I believe that was so.

20,918. Is that the same that they get now?—Yes.

20,919. The men got from 13*s.* to 15*s.* a week?—Yes; they get more now.

20,920. What do they get now?—They will get now from 18*s.* to 20*s.*, and some of them as much as 22*s.*

20,921. He says the mates got then from 14*s.* to 18*s.*?—They get more now.

20,922. (*Mr. Lefevre.*) I presume that the master as well as the men in reality gets more now than he did formerly?—Yes he does.

20,923. Practically his wages have increased?—Yes.

20,924. (*Mr. Caird.*) Have you read over this paper lately?—Yes.

20,925. Do you agree generally with the different observations contained in it?—Yes.

20,926. Your own knowledge and experience have been the same?—Yes.

20,927. Then you put it in as a correct account of the mode of fishing adopted off this coast?—Yes.

20,928. (*Mr. Lefevre.*) Were there great losses among the fishermen off Harwich this year?—Some of the little boats in the harbour were destroyed.

20,929. Not the trawl boats?—No, not fishing smacks.

20,930. How many were there lost?—Ten or 12.

20,931. With their crews?—No, they were sunk in the harbour.

20,932. (*Mr. Caird.*) This is a harbour into which fishing vessels can run in heavy weather?—Yes.

20,933. It is a good place for vessels to run for at any time?—Yes.

20,934. And it is a deep water harbour?—Yes.

20,935. At any time of the tide?—Yes.

20,936. Do vessels run much for this harbour?—Yes, all kinds of vessels both large and small.

20,937. In easterly gales?—Yes.

20,938. (*Mr. Lefevre.*) Is the harbour silting up?—It is growing out at the points, and might be considerably injured if nothing was done to prevent it.

20,939. Is anything being done to prevent it?—There will be shortly.

20,940. What is being done in the matter now?—An Act has just been passed for improving the harbour.

20,941. Has any public money been spent upon it?—8,000*l.* or 10,000*l.* will be spent upon it.

20,942. Does the town raise the money?—Yes, or at least the district.

20,943. (*Mr. Caird.*) Is it within your knowledge that there has been any wasteful destruction of fish or spawn by any mode of fishing that has been practised here?—I should think not. I know of none.

20,944. (*Mr. Lefevre.*) You have not heard complaints from any of the fishermen as to any wasteful destruction having taken place?—No.

20,945. (*Mr. Caird.*) Have you heard any complaint as to the diminution of fish in consequence of the destruction of the brood?—No, except with regard to the shrimps.

20,946. What complaints have been made with regard to shrimps?—I have heard a great deal of complaints with regard to catching them before the month of May and after August.

20,947. Before the proper season for shrimp fishing begins I suppose?—Yes.

20,948. What is the nature of the complaint as to that; do they say that it diminishes the supply of shrimps?—I cannot hear of any diminution.

20,949. But what is the complaint?—They believe there will be a diminution if something is not done to put a stop to the grievance of which they complain.

20,950. (*Mr. Lefevre.*) They have not experienced any great diminution at present, but they think there will be?—Yes, they think there will be.

20,951. (*Mr. Caird.*) Are there any legislative restrictions which at present operate injuriously upon the fishing here?—I think not.

20,952. Do you know at all in your experience whether the constant passing and repassing of steamers along this coast has had any injurious effect upon the fishing?—I think not.

20,953. Nothing of that kind has been noticed by the fishermen themselves or complained of?—No.

The witness withdrew.

THOMAS BRINKLEY called and examined.

T. Brinkley.

20,954. (*Mr. Lefevre.*) You are water bailiff here, I believe?—I am water bailiff to the corporation of Ipswich.

20,955. Can you tell us anything with regard to the oyster fisheries in the Orwell and in the Stour?—I can give you some information with regard to the fisheries in the Orwell and part of the Stour.

20,956. Over what length of time does your experience extend?—I can speak of three years in the Orwell and Stour.

20,957. Not longer than that?—I have been acquainted with the rivers here for the last 30 years, but I have only had an experience with regard to the oyster fishery during the last three years.

20,958. What has been the course of the oyster fishing during the last three years?—We have found that we have not had a great deal of spat.

20,959. Is the oyster fishery upon a public ground?—It belongs to the corporation of Ipswich.

20,960. Is there any great quantity of oysters in the Orwell now?—There is a middling quantity, not any great quantity. It brings in about 700*l.* or 800*l.* a year.

20,961. How many boats are there employed in dredging?—About ten I believe, and sometimes 12.

20,962. Are there any regulations with regard to the fishing?—We have a regulation that they are to bring the oysters to me and then they are sent off.

20,963. Do the oyster beds belong to the corporation of Ipswich?—Yes, the oyster fisheries belong to the corporation of Ipswich.

20,964. Have they a grant of the bed of the river?—Yes.

20,965. How long have they had it?—It is about four years since they had it.

20,966. Has there been any improvement in the fisheries since the corporation took an interest in the matter?—We have found very little improvement in them.

20,967. Is that due to the fact that there has not been any spat?—I think the great evil is trawling over the beds during the time the spat is there.

20,968. Trawling for other fish, not dredging for oysters?—Yes.

20,969. Do you think that that removes the spat altogether, or that it injures it?—I think the nets catch the spat when it rises in the water from the oysters, and again after a short time when it begins to fall again.

20,970. What length of time do you think elapses before the spat attaches itself to any substance?—It remains for a day or two in the water I think.

20,971. And is it during that time that in your opinion the trawlers injure it?—Yes.

20,972. In what way do they injure it?—The trawlers are trawling over the ground just at the time the oysters are spawning, and they sweep the spat away.

20,973. It is very small at that time is it not?—It is so small that it is scarcely seen.

20,974. Then it could not be caught in the net of the trawl boats?—Yes, it is. It is well known that it is caught by the net of the trawls.

20,975. Is it not so very small at that time that it would pass through the mesh of the net?—It might do so, but there would still be a part of it that would stick to the net.

20,976. What regulation would you suggest to prevent that?—I think the trawlers should not be allowed to trawl over the oyster beds in the months of June, July, and August.

20,977. Is that when the oysters are spawning?—Yes.

20,978. What do the trawlers to which you refer catch?—They catch flat fish and shrimps principally.

20,979. How many boats are engaged in that kind of fishing?—Sometimes there will be seven or eight of them trawling over the oyster beds at the same time. They do a great deal of injury in that way.

20,980. Do the boats you refer to belong to Ipswich?—No, to Harwich principally; but some of our own boats go fishing for other sorts of fish.

20,981. Has there lately been an increase in the number of boats which follow that kind of fishing?—No, I think there has been no increase.

20,982. Has there been any decrease?—I think there has been a decrease rather than an increase.

20,983–6. Do they not catch as many fish as they were in the habit of catching in former years?—No.

20,987. They trawl for flounders and dabs?—Yes, for flounders and dabs, and shrimps and soles.

20,988. Would you recommend that there should be any regulation as to the size of the fish that should be allowed to be taken?—Yes, I think there ought to be a regulation.

20,989–93. What regulation would you suggest?—I would recommend that they should be required to put all the fish caught in the trawls overboard that are under a marketable size.

20,994–5. How would you enforce such a regulation as that?—I would enforce it by an Act requiring them to do so.

20,996. Would you prevent such fish from being sold in the market?—Yes, or on board of the boats.

20,997. Do these boats when engaged in that kind of fishing catch many small fish?—Yes.

20,998. How many small fish will they catch in one haul?—Sometimes they catch a bushel all of which are small fish. Some of them are not as big as your finger. The fish caught in the river are principally small fish.

20,999. What are those small fish sold for?—They are sold for bait.

21,000. What do they catch with them?—They are used as bait for crabs.

21,001. Are they much sought for for that purpose?—Yes.

21,002. Do they sell well?—No; they get a mere nothing for them.

21,003. How much?—Perhaps 1*s.* or 6*d.* for half a bushel.

21,004. Have you been deputed by the corporation of Ipswich to come here and give us information in

HARWICH.

T. Brinkley.

7 March 1864.

reference to their interest in the fisheries?—Yes; I have come to Harwich to give you information on the subject.

21,005. Did you communicate with the corporation of Ipswich before you came here?—No; I did not speak to the corporation about it expressly.

21,006. Do you represent their views?—Yes, I represent their views.

21,007. So far as I understand your evidence their interest is mainly in the oyster fishery?—Yes.

21,008. Are you able to inform us what they get from the oyster fishery altogether in the course of the year?—In the course of the year?

21,009. Yes.—Do you want to know what they get for the oysters?

21,010. Yes.—What they have made by it so far is very little. It has not been worth anything to them as yet.

21,011. I suppose they hope it will become valuable to them in the course of time?—Yes, by taking care of it, but it is worth nothing now.

21,012. How do they expect to derive an income from it?—It is only for the benefit of the public that they are working it.

21,013. Then they do not wish to make an income from it for themselves?—No, they only want to get it into such a condition that it will pay the people for working it.

The witness withdrew.

F. R. Harrison.

FREDERICK RICHARD HARRISON called and examined.

21,014. (*Mr. Caird.*) I understand that you represent the corporation of Ipswich?—Yes; I have come here from the office of the town clerk to the corporation of Ipswich.

21,015. (*Mr. Lefevre.*) The corporation have expended a considerable sum of money in endeavouring to improve the oyster fisheries?—Yes.

21,016. How much have they expended in that manner?—About 6,000*l.*

21,017. How was it expended?—Mainly, in the first instance, in paying the expense of a litigation which arose between the corporation and the freemen in regard to the fisheries, and also in compensating the lessees under a lease.

21,018. What freemen do you refer to?—The freemen of Ipswich.

21,019. I presume that they contested the right of the corporation to the fisheries?—Yes.

21,020. And a large sum was incurred by the corporation in legal expenses in establishing their rights?—Yes, and also in settling the claims of the lessee, and in an outlay for brood required to replenish the beds.

21,021. Was nearly the whole of that sum of 6,000*l.* expended in legal expenses?—The larger portion of it was.

21,022. How much was spent in that manner?—All of it with the exception of 1,000*l.*

21,023. How do the corporation expect to recoup themselves?—At one time or another they have laid out about 1,100*l.* in brood and halfware and they hope by carefully keeping the rivers clean, by attending properly to the spatting, and by experiments with the oysters, to establish the fishery on a firm footing.

21,024. Do they charge so much for each boat dredging upon the beds, or do the boats employed in that manner belong to the corporation?—At the commencement of the season the corporation settle the price per wash to be paid for dredging the oysters.

21,025. They sell the oysters?—Yes; to supply the London market.

21,026. How do they sell them?—By so much per wash. We are now getting 16*s.* a wash for the oysters in the London market.

21,027. How many men do the corporation employ in dredging?—This season we have had about 12 boats.

21,028. How many men are there in each boat?—There are sometimes two men in a boat.

21,029. This system has been going on now for the last four years?—The Act obtained the royal assent on the 1st of August 1859.

21,030. Were there no oysters in the river before?—Yes, there have been oysters in the river for more than 100 years, and they have been dredged by the freemen.

21,031. The freemen of Ipswich?—Yes.

21,032. Was it found that the oysters were diminishing in number?—Some of the freemen gave evidence upon the bill when it was before a Committee of the House of Commons. They stated that there was a large quantity of oysters years ago, and in fact that as compared with former years there had been no season of late in which there had been so much spat.

21,033. Do you agree with the witness who gave his evidence a short time ago—Mr. Russell—that in consequence of a close time having been established the oyster fisheries have fallen off?—I do not agree with that opinion. It has not been the case with regard to our oyster beds.

21,034. What has been your experience?—During the close season the corporation have the boats they employ constantly at work cleaning the river with open dredges and removing the oysters from one place to another for the purpose of enabling them to breed and improve.

21,035. Perhaps if that were not done and the beds were not interfered with at all during the close time the oysters would be injured?—The object of employing the boats in the close time is to keep the bottom clear from weeds, and to prevent it from filling up.

21,036. Then if the fishing in the river were an entirely open fishing and at the same time there was a close time during which all dredging was prohibited damage might ensue to the beds; is that so?—I cannot quite understand the question.

21,037. If the fishery were entirely open and were not the property of the corporation, and if at the same time a close time were enforced, do you think that damage would ensue in consequence of the river not being dredged during the close time?—Yes; no doubt damage would be done if the beds became foul with pipe weed and other things.

21,038. The corporation, being aware of that, have the river dredged during the close time?—Yes.

21,039. (*Mr. Caird.*) How far do the rights of the corporation to the oyster fishing in the Orwell extend?—From Ipswich from a line drawn at Shottley Point to Fagwell Cliff on the opposite side of the river.

21,040. That does not come within the oyster fisheries referred to as being leased from the Crown?—No; they are in the Stour.

21,041. Do the corporation of Ipswich claim all the fisheries in the Orwell?—Yes.

21,042. Do they claim under any charter?—Yes; under a charter of King Henry the Eighth.

21,043. And they are endeavouring to improve the revenues of the corporation from those fisheries?—Yes.

21,044. In your opinion are they likely to be successful?—I do not think they have any reason to despair.

21,045. Have you any reason to believe that from the new mode of management adopted by the corporation in regard to these fisheries the supply of oysters is likely to increase?—Yes; a fortnight ago our oyster committee had an experimental trial of the river, and they found halfware and half-sizeable oysters.

21,046. When did they first adopt the system of managing the oyster beds on their own account?—They took the management of the fishery into their own hands from the 1st of August 1859.

21,047. That was the date of the Act of Parliament?—Yes; the royal assent was given to the Act on the 1st of August 1859.

21,048. Since then have they gone on with the intention of keeping the whole of the fisheries in the Orwell in their own hands?—Yes.

21,049. And fishing them by the employment of persons at so much wages?—Yes.

21,050. Do they thereby expect to increase very much the revenues of the corporation?—Yes.

21,051. And also the supply of oysters?—Yes.

21,052. Has the increase in the supply of oysters from the fishery been progressive since the corporation commenced that system?—Yes. Considering that there have not been any good falls of spat—in fact the falls of spat have been very small indeed—they have still taken as many oysters in proportion this season as in prior seasons.

21,053. Since the Act of Parliament to which you refer came in force and since the new system commenced, has there been, on the whole, an equal supply of oysters from the corporation oyster beds to that which was obtained previous to the passing of the Act?—One or two years before there was a much larger supply of the small oysters on account of the very large falls of spat which occurred, but since the date of the passing of the Act there have been very bad falls of spat.

21,054. That I believe has not been confined to this locality but has been universal?—Yes.

21,055. (*Mr. Lefevre.*) You do not attribute that to the foulness of the bottom of the river where the beds are?—No; I attribute it to the season.

21,056. The same cause affects all the fisheries in a similar manner?—Yes. There has been a general complaint of late years with regard to the scarcity of spat.

21,057. At Colchester the complaint has been the same?—Yes.

21,058. (*Mr. Caird.*) Is there any shrimp fishing in the Orwell?—Yes; the Kentish boats come to fish for shrimps.

21,059. Is there a considerable fishing for shrimps?—Yes; and we have prohibited them from fishing over the oyster beds.

21,060. Are there no shrimp grounds fished independent of the oyster grounds?—No, none.

21,061. Is there no shrimp-fishing in the Orwell then now?—Yes, from time to time, but we prohibit it during the close season.

21,062. But in the open season you allow it?—It does not injure the oyster beds then, on the contrary it does good because it helps to clean the ground.

21,063. Do the corporation levy anything for the privilege of fishing for shrimps?—Nothing whatever.

21,064. It is perfectly free for all persons to follow the fishing?—It is free for the fishermen of the port and of Harwich.

21,065. Do you know whether that description of fishing has been increasing or diminishing in the Orwell?—I cannot say.

21,066. Is it a large interest and an important source of revenue to the fishermen?—I have heard complaints from the fishermen that they have not caught as many as they did formerly both of shrimps and other kinds of fish.

21,067. (*Mr. Lefevre.*) I think I understood you to say that there was litigation between the freemen and the corporation of Ipswich?—Yes.

21,068. Did the case go up to the Court of Queen's Bench?—Yes; I believe it did.

21,069. Is it reported in the law books?—Yes; and the Act of Parliament eventually settled the question as between the corporation and the freemen.

21,070. How was it decided at law?—It was decided that the corporation had the right of controlling the fisheries in the Orwell.

21,071. Was the litigation subsequent to the Act of Parliament?—No; it was prior to the Act. The Act was obtained for the purpose of settling all the questions raised on that occasion.

21,072. Was it a compromise?—Yes.

21,073. Is there anyone here who is acquainted with the fishing?—Yes; there is a fisherman here who has been a fisherman upon the river for 28 years.

The witness withdrew.

THOMAS DENNY called and examined.

T. Denny.

21,074. (*Mr. Caird.*) I believe you have had considerable experience in connexion with the fisheries at Harwich?—Yes.

21,075. Has your experience extended to all the kinds of fishing practised here?—Yes.

21,076. And your knowledge and experience have also extended over a good many years I suppose?—Yes.

21,077. In your opinion, is the supply of fish brought to Harwich increasing or diminishing?—The quantity of fish brought to Harwich has been increasing very greatly during the last three or four years.

21,078. Do you refer to any particular kinds of fish, or to all kinds?—I refer principally to codfish.

21,079. To the codfish brought here in welled smacks?—Yes, brought in by various vessels.

21,080. Not Harwich vessels alone?—No. The Greenwich, Barking, and sometimes the Grimsby vessels come here with fish. There has been a very large supply of fish at Harwich during the last three years.

21,081. Chiefly codfish?—Yes.

21,082. Have you yourself been engaged in the cod smacks as a long-line fisherman?—I have never been a fisherman myself, but I have a smack engaged in cod-fishing.

21,083. Then you can speak from your own personal knowledge to the fact whether it is becoming a more profitable fishing than it used to be?—It has been more profitable to the town because there has been a larger number of vessels visiting the harbour, and of course as a natural consequence a larger sum of money has been spent in the town than would otherwise have been.

21,084. Are the vessels of the same tonnage and size as those which used to come here in former years?—Yes, they are of various sizes.

21,085. What is the average tonnage?—Some of them will be 50 tons, some 60, and some 70 tons.

21,086. Are you able to say whether vessels of the same size and tonnage now catch as large a quantity of fish in the same length of time as the vessels engaged in the fisheries 10 or 15 years ago?—I think they even catch a larger quantity. I know that a great deal more fish is caught now than was caught 20 years ago.

21,087. They make a better fishing now than they used to do?—Yes.

21,088. Do they find more fish upon the fishing grounds than they did in former years, or does the increase arise from other circumstances?—I believe they find more fish on the grounds.

21,089. Are the fish of as fine a quality?—Yes.

21,090. Then there has been no falling off, as far as your experience goes, either in the quantity or the quality?—No, and I have been a fishmonger in Harwich now for 26 years.

21,091. (*Mr. Lefevre.*) What has been your line of fishing mostly?—Principally cod-fishing and shrimping.

HARWICH.

T. Denny.

7 March 1864.

21,092. Have you been engaged in trawling in the rivers?—I have not fished much in the rivers. I have no boats that trawl in the rivers. They go after other fish.

21,093. (*Mr. Caird.*) I understood you to say that you have had an experience of the shrimp-fishing here?—Yes.

21,094. Has that fishing increased or diminished of late years?—It has increased.

21,095. Has it increased much?—Yes, very much.

21,096. Is it increasing year by year?—Yes, year by year.

21,097. I presume that it has therefore been found more profitable by the fishermen themselves?—It has no doubt been found more profitable during the last 20 years.

21,098. How many boats were engaged in it 20 years ago?—Twenty years ago there were only two boats that went from Harwich catching shrimps.

21,099. How many are there now?—There are about 70 in the course of the season.

21,100. (*Mr. Lefevre.*) Does that number include those which come from Lea?—Yes, from Lea and other places. From Feversham in Kent and Strood and other parts.

21,101. (*Mr. Caird.*) Do those 70 boats now work upon the same ground that two did 20 years ago?—Yes.

21,102. Then there must be a vast deal more shrimps caught now than were caught 20 years ago?—Yes, certainly. There are more caught now in one week than were caught, 20 years ago, in the course of a year.

21,103. Yet there does not seem to be any diminution in the supply, notwithstanding that there has been such an enormous increase in the quantity caught?—At times they are somewhat scarce. There are more some times than at others.

21,104. But on the whole the fishermen make a very good business of it?—The men manage to make a living out of it generally.

21,105. They do not appear to have fished the shrimps out and exhausted them?—No.

21,106. The working of that excessive number of boats does not seem to have led to any diminution in the quantity of shrimps?—No, but they may have found different spots of ground to go to.

21,107. Do they catch a great quantity of small and immature fish?—They catch very few indeed in the shrimp nets.

21,108. Young soles and so on?—Very few.

21,109. No very large quantity?—No, no large quantity.

21,110. What do they do with them when they catch them?—The chief of them are thrown overboard. It is in the summer time when they catch them principally, and they have no use for them. If there are any among them that are at all sizeable and fit for sale they sell them; the rest they chuck overboard.

21,111. Are they alive or dead when they are thrown overboard?—Alive.

21,112. Then in your opinion the fishermen even when they catch these small fish do not destroy them?—No, I think not.

21,113. Do you not think that there is a very large quantity destroyed by the shrimp nets?—I never saw a great quantity caught. As a general rule they only catch what is saleable.

21,114. Those which are saleable are brought ashore and sold?—Yes.

21,115. What sort of market do they go to?—Different people buy them.

21,116. Do they go among the poorer classes for consumption?—Yes, principally.

21,117. Is there a large quantity of that description of fish sold to the poorer classes in the shrimp season?—Yes, there is a largish quantity sold then.

21,118. What does it principally consist of?—It consists chiefly of what we call river plaice. It is not the large plaice but a very small fish.

21,119. Are they sold at a low price?—Yes.

21,120. Do they go into consumption in Harwich and in the immediate neighbourhood?—Yes.

21,121. And that takes place principally in the summer months?—Yes, generally in the summer time.

21,122. Are any of them sent to the London market?—No.

21,123. None of them?—No.

21,124. Do they form a principal portion of the food of the people at that time?—Yes, they can buy as little as two or three pennyworth.

21,125. Then the poor profit by it?—Yes.

21,126. Do a large number of the poorer classes make use of this description of fish at that time?—Yes.

21,127. (*Mr. Lefevre.*) Then so far as the poor are concerned they would not like to see any regulation established which would put a stop to the catching of these fish?—No, I think not. If it were put a stop to many persons would be hindered from earning a few shillings and the poorer classes would not be able to get them as food. That would no doubt be felt as a great injury by the poor as well as by the persons engaged in catching the fish.

21,128. And perhaps you would not catch them when they got of a larger size?—The fish of which I am speaking are river plaice and they never grow large.

21,129. What is the principal ground upon which the shrimp fishing is carried on?—The principal ground is a clear ground; "Rossy" ground we call it.

21,130. Is it outside the river?—Outside?

21,131. Yes; you do not catch the shrimps inside the river?—No.

21,132. Where does the fishing ground run?—Right up from Cowan down to Harwich and as far down as Orford Head.

21,133. Where is Orford Head?—A few miles from Landguard fort below Felix Cliff. They go down as low as Woodbridge Haven.

21,134. From Orford Ness down to Woodbridge?—From Carn bar at the mouth of the river Carn upwards towards the Thames as far as the Colne.

21,135. What distance will that be altogether?—I suppose it will be about 22 miles.

21,136. How far out at sea do they catch them?—Sometimes as much as four, five, and seven miles.

21,137. In what depth of water?—In four, five, or six fathoms, and sometimes as little as three. The depth of water varies.

21,138. Is there much shrimping by hand?—None at all, scarcely.

21,139. It is carried on entirely by boats?—Yes, almost entirely by boats.

21,140. Have the fishermen any recognised season for going after the shrimps?—They begin generally about the latter part of the month of April.

21,141. And do they go on from April all through the summer?—Yes, they go on through the summer until the latter part of October. Sometimes some of the fishermen will continue shrimping until the winter, but the shrimps run very small then, as that is the time they spawn. The net is a very small one, and if a large body of them get into it they choke it up and when it is hauled in they are all dead. They are like the sprats; they run into the bottom of the net and there they get choked and die.

21,142. Is there any sprat-fishing here?—Yes.

21,143. Is it a considerable fishing?—There is not so much of it here. It is carried on to a greater extent more towards the Kentish coast and away in that direction.

21,144. Do you not catch shrimps in the Orwell and in the Stour?—A few, but not very many.

21,145. Is it not worth while to follow it as a business?—No.

21,146. Are there many caught in Handford water?—There are a few caught there. They are mostly large shrimps.

HARWICH.

T. Denny.

7 March 1864.

21,147. Are there any caught up the Blackwater?—I cannot speak with regard to that.

21,148. Do you yourself follow the shrimping in the season?—No; but I have boats that go to it.

21,149. How many have you?—Three.

21,150. Do they pay you well?—Sometimes they pay middling.

21,151. How long have you had them?—I have had boats for the last 20 years.

21,152. I suppose that you began as a fisherman?—Yes.

21,153. And having saved money you bought these boats?—Men engaged in fishing have what they can earn; they work by the share.

21,154. But you yourself saved money and bought these boats?—Yes, to some extent. I got them by various things; a little out of one thing and a little out of another. I am a fishmonger as well, and I have also a cod smack.

21,155. How many men go in these shrimpers? Two or three?—Two and a boy generally.

21,156. What wages do you pay them?—Sometimes they will earn 25*s.* a week; sometimes 30*s.*; and at other times only 10*s.* or 12*s.*

21,157. Are they paid by share?—Yes, there is no regular pay.

21,158. What share does each get?—One share.

21,159. Each man gets a share?—Yes.

21,160. How much does the boat get?—Only one share, unless it is a large boat, and then it gets a share and a quarter.

21,161. How much does the boy get?—They pay the boy between them; perhaps 5*s.* a week.

21,162. Are the men mostly from Lea, or are they Harwich men?—Lea men belong to Lea boats, and Harwich men to the Harwich boats.

21,163. How many of the shrimp boats belong to Harwich?—About 20.

21,164. And the men go out to other kinds of fishing in the winter?—Yes.

21,165. (*Mr. Caird.*) Within your experience as a fish salesman has the price of fish increased on the average or diminished during the last 10 years?—The price has increased in Harwich on account of the railroad. The opening of railway communication has tended considerably to increase the price of fish.

21,166. Have you not had railroad communication from Harwich for more than 10 years?—The railroad opened in 1854.

21,167. And since the opening of the railroad the price has increased?—Yes.

21,168. Has it kept steadily increasing?—It has been about the same since the railroad opened.

21,169. (*Mr. Lefevre.*) I suppose that the railroad has made the shrimping here?—Yes.

21,170. There was none before the railroad came here?—There was scarcely anything at all, and now I send a great quantity to London, sometimes as many as 400 gallons a day.

21,171. Do your boats catch that quantity?—No.

21,172. You buy them then?—Yes.

21,173. Do they go up to London by the fast train?—They go by the fish train, which runs at 9 o'clock.

21,174. They go up to Billingsgate?—Yes.

21,175. (*Mr. Caird.*) Are there many turbots brought here?—There are a few brought from the North Sea and the coast of Holland, but they are very few.

21,176. (*Mr. Lefevre.*) Are the shrimps caught off here better shrimps than the shrimps caught in the Thames?—I cannot answer that question; I have not seen the shrimps caught in the Thames and therefore I cannot say. We get considerably more of the red shrimps than we used to do 20 years ago. At one time they would scarcely sell in London, and now they sell very well and realize a great deal of money.

21,177. (*Mr. Caird.*) Has the opening of the railroad been a great inducement to fishing vessels belonging to other places to come here and land their fish?—Yes.

21,178. It has considerably increased the number of vessels frequenting Harwich?—Yes.

21,179. Do they pay harbour dues when they come in here?—Yes, they have to pay harbour dues now.

21,180. Do all the boats that come here pay harbour dues?—Not all; only those of a certain tonnage.

21,181. What is the limit of tonnage that renders a vessel liable to pay the dues?—The limit of tonnage is I think 30 tons.

21,182. Everything above 30 tons pays the dues?—Yes.

21,183. Does anything below 30 tons pay?—Nothing below 30 tons pays; but the fishing vessels which come here are all above 30 tons.

21,184. Is the same rate of dues charged on fishing vessels as upon other vessels?—Yes; at one time fishing vessels did not pay any dues at all.

21,185. How long is it since the dues were first charged upon fishing vessels?—Since the passing of the Act of Parliament—the Harbour Act. There were no dues levied upon fishing vessels before.

21,186. Is the imposition of those dues felt by the owners of the fishing vessels as a grievance?—Yes, they regard it as a great grievance. They complain of it because this is the only place in which they are charged. The fishermen have never been called upon to pay harbour dues anywhere else.

21,187. They pay none anywhere else?—No.

The witness withdrew.

EDWARD CHAPMAN called and examined.

E. Chapman

21,188. (*Mr. Caird.*) You are acquainted with the subject referred to by the last witness, namely, the harbour dues levied upon fishing vessels?—Yes.

21,189. You are, at Harwich, an exception to all other harbours in that respect, I believe?—Yes.

21,190. (*Mr. Lefevre.*) Can you quote the section of the Act under which you claim the right to charge fishing vessels with harbour dues?—All vessels are subject to a general clause. There is no exemption whatever except in the case of vessels under 30 tons. Here is a copy of the Act.

21,191. (*Mr. Caird.*) This is the Act of Parliament under which you levy the dues?—Yes. The Act is carried out by a Conservancy Board, consisting of five members nominated by the Government and four by the localities, namely, two by Ipswich, one by Harwich, and one by Mistley and Manningtree.

21,192. Do you not think that the imposition of these dues upon the fishermen is likely to operate injuriously upon the interests of the harbour here?—I have no doubt of it; and the fishermen themselves are very sensitive upon the subject of paying dues. A very few shillings imposed upon them, especially if they think it unjust, will drive them away to other harbours where they have no dues to pay.

21,193. Then is it politic on the part of the corporation to charge those dues?—It is not in our power to act otherwise.

21,194. How is that?—The Conservancy Board, as I have already stated, is composed of five members appointed by the Government, namely, two by the Board of Trade, one by the Trinity Board, one by the Treasury, and one by the Admiralty; and then four appointed by the localities, one by the corporation of Harwich, one by the corporation of Ipswich, one by the dock owners of Ipswich, and one by the ratepayers of Mistley and Manningtree.

21,195. What is the amount of the dues levied by the board?—One penny per ton on all vessels ex-

HARWICH.

E. Chapman.

7 March 1864.

ceeding 30 tons burden, but with power to exempt vessels with the sanction of the Board of Trade.

21,196. How many ports does the Act of Parliament embrace?—Harwich and Ipswich.

21,197. Then it bears more hardly upon Harwich than Ipswich?—Yes.

21,198. Inasmuch as no fishing vessels go to Ipswich?—Yes.

21,199. Are you in a position to say that the corporation of Harwich desire that all fishing vessels should be exempted from the payment of these dues?—Decidedly. We should be very glad to see the fishermen relieved from all liability to pay the dues.

21,200. Cannot you prevail on the other members of the Conservancy Board to exempt them on the ground that fishing vessels in all other ports are exempt?—Our representative at the Conservancy Board has strongly urged upon the board the advisability of exempting the fishing vessels, and I believe that the board is inclined to entertain the proposition, but the Board of Trade will not sanction it at present.

21,201. (*Mr. Lefevre.*) Are you quite sure that under this Act fishing vessels above 30 tons burden must pay these dues?—I am certain that under the Act all vessels above 30 tons must pay them. There is no exemption.

21,202. I understand that fishing vessels claim a right by custom to exemption everywhere from all harbour dues?—But this is an Act of Parliament passed recently which overrides everything.

21,203. If the Act does not specially mention that fishing vessels are to be liable to the charge, would not the custom which has always prevailed hitherto hold good?—It would have held good prior to the passing of this Act, but in my opinion this Act overrides everything.

21,204. Does it mention fishing vessels in so many words?—It says "all vessels."

21,205. Perhaps it would be well to ascertain whether there is anything in that point?—I think there is not. I know that strong representations have been made upon the subject, and the whole question has been discussed at the Conservancy Board, and by the Conservancy Board with the Board of Trade. The Conservancy Board have been particularly desirous of exempting fishing vessels.

21,206. (*Mr. Caird.*) I suppose that the dues are only payable by the large well-smacks?—All the large well-smacks are above 30 tons.

21,207. Do the dues vary?—No; it is 1*d.* per ton.

21,208. Are they levied every time a vessel comes into the harbour?—Yes.

21,209. (*Mr. Lefevre.*) That may fall very heavily upon some fishing vessels?—Yes, it does fall heavily upon many of the vessels.

(*The witness Thomas Denny.*) My vessel has been in three times during the last three weeks, and has had to pay the dues on each occasion.

21,210. How many tons burden is your vessel?—Thirty-one tons.

21,211. (*Mr. Caird.*) Then it has paid 2*s.* 7*d.* a week?—Yes.

21,212. (*To Mr. Chapman.*) The fishermen look upon the payment of these dues as a great hardship?—No doubt they do. If they were only required to pay a shilling they would run anywhere if they could to avoid it.

(*Mr. Harrison.*) With regard to the oyster fisheries, perhaps you will allow me to say that the harbour is greatly used by vessels from the Colne and other parts, which employ themselves in dredging the spat of the oysters and carrying it elsewhere. If it were not disturbed it is thought that the fisheries would be greatly improved. That is thought to be a very material point, and I believe that any fisherman who has been employed in oyster dredging can give you any information you may desire upon the subject.

21,213. Has that taken place in the Orwell?—Yes, and in the whole of Harwich harbour as well. The spat comes down the rivers into the harbour.

T. Denny.

THOMAS DENNY recalled and examined.

21,214. (*Mr. Caird.*) Can you give us any information in reference to the destruction of spat in the harbour of Harwich?—Yes, I think I can.

21,215. What is the system of dredging adopted, and what is the point of which you complain?—We complain that a great number of boats come here from Colchester, Whittlesea, Wivenhoe, and other places, and that they dredge all the spat from Harwich all over the port. They take away all the spat that ought to be left for replenishing the beds here, and they carry it away to other places.

21,216. Does that take place in the summer time?—In the summer time and all the year through.

21,217-8. Do they get much spat?—About 4,000*l.* worth, taking one year with another.

21,219. Is there no means by which the authorities here would of themselves be enabled to put a stop to that?—I cannot say. Perhaps Mr. Chapman will tell you that. He is acquainted with it better than I am.

21,220. (*To Mr. Chapman.*) Have the authorities any power to put a stop to these proceedings?—The Conservancy Board have only power to stop them as far as they interfere with the navigation of the harbour. The corporation of Ipswich claim a jurisdiction over nearly the whole of Harwich harbour.

21,221. (*Mr. Lefevre to Mr. Harrison.*) Cannot the corporation of Ipswich put a stop to this?—Some years ago the corporation of Ipswich used strictly to prohibit other vessels from taking spat, brood, and culsh from the harbour; but that prohibition has now fallen into disuse, and the regulation has not been strictly enforced. It is now thought necessary for the protection of the fisheries that it should be re-established and rigidly enforced.

21,222. Mr. Denny informs us that spat to the value of 3,000*l.* or 4,000*l.* has been taken away?—Yes, I believe that is true; but if it was left in the harbour, probably it would not produce more than that.

21,223. Is there a greater stock in the harbour than it will bear?—There is a large amount of surface in the harbour from which the spat might be constantly dredged and removed to the rivers here by the fishermen employed by the corporation. In that case, both rivers, the Stour and the Orwell, would derive an advantage.

21,224. Am I to understand that what you do not like is the notion that other people are allowed to come here from a distance and carry the oysters off to their own rivers?—Yes.

21,225. As far as the public are concerned it would not much matter whether the young oysters are fattened in the Stour or in the Orwell, or in any other river?—There is probably more than is necessary to supply the harbour.

21,226. (*Mr. Caird to Thomas Denny.*) What would become of that spat if it was not taken away?—It would be taken up into the rivers Orwell and Stour and laid down.

21,227. Was it ever so taken up?—No; but we never had regular oyster beds there until now.

21,228. Cannot you take it up those rivers now?—I suppose we can.

21,229. If these persons had not come from Colchester and other places and taken it away it would have been lost?—Yes.

21,230. (*Mr. Lefevre.*) There is nothing to prevent you from dredging it now and selling it to these people?—No.

21,231. Then why not do so?—Some do, but we had nobody to buy it before.

21,232. In point of fact you did not think of it until other persons came here and carried it away?—Now we have oyster beds here, it will be of benefit if

HARWICH.

T. Denny.

7 March 1864.

the persons who have the beds employ persons to dredge the oysters in the harbour and place them upon the beds.

21,233. (*Mr. Harrison.*) The corporation do occasionally take out culsh in the river and lay it on the beds.

21,234. (*Mr. Lefevre.*) You have more spat than you will require for your own river?—No, there is very little now.

21,235. In a good year there may be more than you want?—Yes, a very great deal more.

21,236. (*Mr. Caird.*) Do the Colchester people contend that they have any right to come here?—Yes, no doubt they do claim a right.

21 237–8 (*To Mr. Chapman.*) Have they a right?—That is a question I should not like to answer.

21,239. Have they been in the habit of coming here for any length of time?—Yes, for a long while now. They come principally from Colchester and Handford Water.

21,240. (*Mr. Lefevre.*) There may be some doubt whether your charter enables you to prevent them from coming?—There may.

J. Folley.

James Folley called and examined.

21,241. (*Mr. Caird.*) Can you add anything to what has been stated already on the part of the corporation of Ipswich with regard to the Orwell?—Yes, I can show you what the decrease of fish in the river has been.

21,242. (*Mr. Lefevre.*) The decrease of oysters?—No.

21,243. (*Mr. Caird.*) Of what kind of fish then?—Flat-fish and soles. We should have very good ground here for those kinds of fish if they were not caught when so very small.

21,244. Where are they caught?—From Pinwell down to the lower part of the river.

21,245. Has the catch decreased?—Yes.

21,246. Between what years do you draw a comparison in order to show the decrease?—There has been a decrease during the last 10 or 12 years.

21,247. Who is it that catches these small fish?—The fishermen in the river.

21,248. Do you yourself fish in that way?—Yes.

21,249. Cannot you catch now as many of those fish as you used to get?—No.

21,250. What do you attribute that diminution to?—To the trawl fishermen.

21,251. In what way have they brought it about?—When they catch these small fish instead of putting them overboard again they save them for bait.

21,252. For what sort of bait?—For crab bait.

21,253. Can you tell us anything about the oyster fisheries?—I have been in the habit of dredging for oysters before the Act was passed which prohibits us from doing so.

21,254. In your opinion is that new Act likely to increase the supply of oysters?—Yes.

21,255. Do you think it will increase the supply considerably?—Yes, if one thing is put a stop to.

21,256. What is that?—The practice adopted by the large Kentish boats of coming here to dredge in the river and carrying everything away.

21,257. Do they go over this ground?—Yes. I have seen as many as 12 boats shooting away right through the lower reach, and they have been continually at work throughout the whole day.

21,258. What have they been fishing for?—They were fishing for shrimps then.

21,259. Was that during the close time of the oyster fishery?—Yes, I have seen them there the whole season round.

21,260. (*Mr. Lefevre.*) We have been told that they do not shrimp much in the river?—I have occasionally been on board when they have hauled up their trawls, and in the latter part of the season I have seen small oysters a little bigger than my thumb smashed all to pieces in the net. They are taken up before they have any substance in them, and before the shell has properly become the shell of an oyster. I have seen thousands of those small things destroyed.

The witness withdrew.

T. Denny.

Thomas Denny recalled and examined.

21,261. (*Mr. Caird.*) Has the number of vessels fishing on the Galloper and on those banks which lie principally off Harwich increased within your recollection?—Yes, very much.

21,262. And the supply of fish on those banks has not diminished?—No.

21,262*a*. Has it increased?—It has increased materially.

21,263. Then the greater extent of fishing does not appear to have been followed by any diminution of the annual supply of fish?—Certainly not; it has increased materially.

21,264. Do you find now that your fishing vessels going from Harwich can get fish nearer home than they did formerly?—Yes. They are at work now off the Galloper.

21,265. Notwithstanding the great increase in the number of vessels which now come down the Thames for the supply of the London market, you find that you can get more fish nearer home than you used to do?—Yes; there are a large number of vessels at the present time on these banks.

21,266. Are there any engaged in trawling on the banks now?—Yes, both trawling and line fishing.

21,267. Can the two modes of fishing go on together without injury to each other?—Yes; but I am sorry to say that the Frenchmen are fishing there, and they steal our gear and buoys. I lost last week as much as 5*l*. or 6*l*. worth.

21,268. (*Mr. Lefevre.*) Cannot you ascertain the number of the vessels that commit those depredations?—It could be done if we were near enough, but very frequently our people are a good way off hauling in the lines when they cut the gear. The lines extend over a distance of some miles, and the Frenchmen go to one end of the gear and steal it while the fishermen are hauling in at the other. They are away before we can get at them.

21,269. If you caught them you would stop them?—We could not do that. They have as many as 12 hands on board their vessels.

21,270. (*Mr. Caird.*) What depth of water is there on the Galloper where you fish?—From 12 to 25 fathoms.

21,271. Is that about the same depth as the water on the Dogger Bank where you get the cod-fish?—There is as little as ten fathoms there, and from that to 12 and 20 fathoms.

21,272. It is about the same depth?—We fish at various depths.

The witness withdrew, and the inquiry was adjourned until Monday the 28th of March at Polperro.

Polperro, Cornwall, Monday, 28th March 1864.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

POLPERRO.

JONATHAN COUCH called and examined.

J. Couch.

28 Mar. 1864.

21,273. (*Professor Huxley.*) I believe that you have resided here for a long time, Dr. Couch?—Yes, for a long time.

21,274. For how many years have you known Polperro?—I can go back for 50 years. I have made notes here for the last 50 years.

21,275. And you have been intimately acquainted with the condition of the people of Polperro for that length of time?—Yes, intimately.

21,276. I believe that you have made the subject of the fisheries and fishes a special inquiry of your own?—Yes, particularly.

21,277. Can you tell us what the population of Polperro is at this moment?—We generally estimate it at 1,000. Up and down there may be about that number.

21,278. And out of that population what is the proportion of persons engaged in fishing?—I hardly know what the actual number engaged in fishing is. We have here somewhat more than 30 boats, and perhaps three persons will be engaged in each of them, at one time or another. I have never counted them, but I should say that there are perhaps 100 actually engaged at sea in fishing. Of course those who are concerned in the fishing here will considerably exceed that number.

21,279. Is there any population here, of importance, besides the persons who are actually engaged in fishing or concerned in it?—No, I think not.

21,280-1. So that Polperro may be regarded as a fishing place altogether?—Yes.

21,282. And what is the average crew of each boat?—In the mackerel season the larger boats will carry four hands each. The seiners required more men when we had seines formerly. They would carry about 16 or 18 men. The small boats carry from two men and a boy to three men.

21,283. May we take it that on the average there are three fishermen to each boat?—Just so. That is about it.

21,284. Are the boats used here open boats, or are they decked?—Some of them have a partial deck.

21,285. A sort of little forecastle deck?—Yes, more or less. There is not more than a third or a fourth part of any of them decked, and the larger number of the boats have no deck at all.

21,286. What, upon the average, is the tonnage of these boats?—The average will be about nine or 10 tons to a boat.

21,287-8. What is the average cost of each boat when rigged and ready for fishing?—I think the average cost of the mere boat itself in the first instance will be about 100*l.*

21,289. Is that the hull of a boat?—The hull and rigging. A rigged boat will cost about 100*l.*, leaving the fishing gear out of the question.

21,290. What addition to the cost will the fishing gear make?—Perhaps that will add 100*l.* more.

21,291. Then I shall be right in saying that the average cost of one of your fishing boats fit for its work is about 200*l.*?—Yes, I think that is about the cost. You may take the average to be 200*l.* for the boat with its fittings and fishing gear.

21,292. When you first knew Polperro, Dr. Couch, was there the same number of fishing population?—I think there was just about the same number.

21,293. And about the same number of boats?—The number of boats has fluctuated, I believe, from 25 up to 35.

21,294. Then the average number has remained about the same?—Yes.

21,295. Have the boats continued to have about the same build and make?—Yes, about the same build and make, except that now we cannot reckon among our fishing boats the seine boats which formerly existed There were several here in years gone by, but there are none now.

21,296. You refer to the seine boats for the pilchard fishery?—Yes, the pilchard seine boats; they were much larger than the boats that are used here now.

21,297. When you first knew Polperro how many seine boats were there?—We had several seiners, which worked according to the regular rule—that is, three boats to each seine. I think there were at one time three seines here.

21,298. Pilchard seines?—Yes.

21,299. (*Mr. Lefevre.*) Were they seines that were dragged up on to the shore?—No.

21,300. The boats which carried the seine nets were simply rowing boats?—Yes, they were entirely rowing boats. I have been present at the pilchard seine fishing, and have seen the boats at work.

21,301. (*Professor Huxley.*) Has the supply of fish brought into Polperro remained the same during your experience, or has it perceptibly increased or diminished?—It has been very far from what it used to be.

21,302. What has been the difference?—There has been a very great diminution.

21,303. Has that diminution occurred of late years, or has it been going on gradually?—There has been a gradual diminution for almost the last 30 years.

21,304. In what kind of fish has the falling off principally taken place?—Generally in codfish, whiting, and that class of fish.

21,305. The long-line fish?—With us there is but very little long-lining carried on. The mode of fishing adopted here is almost always by hand-lines used from the boat.

21,306. Will you be good enough to explain the nature of the gear commonly used in the fishing-boats?—They generally use lines—long hand-lines. Each man will at least employ two, with a heavy piece of lead attached to each of them. The lead sinks the line in mid-channel.

21,307. What is the nature of the hooks?—Each line has a large single hook.

21,308. How many lines does each boat carry?—There are six or seven lines to each boat. Every man employed in one of these boats is in the habit of using two hand-lines at one time; but they will probably carry more altogether in the boat, inasmuch as they might lose some of those with which they were working.

21,309. They carry spare lines, you mean?—Yes, generally.

21,310. I presume that the whole of the fishing gear of each boat will amount to something more than that, and include an entire set of nets? Is that not the case?—Yes, but when the fishermen are engaged in using the hand-lines, they do not commonly use the nets. When nets such as those for mackerel or pilchards are used, they are frequently only used to occupy the vacant time. They will go out 10 or 12 leagues from the land with the hand-lines which I have described, for the purpose of catching conger, cod, ling, and haddocks.

21,311. What are the different fishing seasons here? We will take for example the fishing season at the beginning of the year?—There are two classes of fishing then.

21,312. What are they?—One is the mackerel-fishing by nets in the beginning of the year. It commenced on the 2d or 3d of January this year, I

believe. The boats went out then, and caught mackerel, and they continued at that fishing until they were interrupted by the weather.

21,313. You are speaking now of the drift-net fishing for mackerel?—Yes.

21,314. How long does the mackerel drift-net fishing continue?—It continues as long as the fishermen find themselves able to catch the fish.

21,315. But how long does it continue, on the average?—Up to the month of June or July. Then succeeds the mackerel or seine fishing, but that is more practised at Looe than here.

21,316. What are the boats which employ themselves in fishing for mackerel here?—The drift-net boats, but the fishermen catch a large quantity with lines. The principal fishing, however, is with the drift-nets.

21,317. Do the drift-nets go out principally in June and July?—Yes.

21,318. Is that fishing confined only to the larger boats?—There are four only here.

21,319. Then what do the smaller boats do during that time?—They are fishing with lines.

21,320. Are they the hand-lines you were speaking of just now?—Yes.

21,321. Then during the first six months in the year the fish brought into this place are principally mackerel, conger, and ling?—Yes, mackerel, conger, ling, whiting, haddock, and so forth. As soon as the weather gets mild we get a kind of bream.

21,322. That is in the latter part of the time?—Generally in the beginning of the month of August the attention of the fishermen becomes principally directed to the pilchard.

21,323. Are all the fishermen here employed in the pilchard fishery?—Yes, or at any rate the large majority.

21,324. Do they fish for pilchards with drift-nets?—Yes.

21,325. With drift-nets only?—Yes.

21,326. Then have you no pilchard seines here now?—No.

21,327. Are the nets you use of the same kind as those you use in catching mackerel, or are they different?—They have a different mesh.

21,328. How long does that kind of fishing last?—It lasts until it is interrupted by the weather. There are some remarkable things which alter the nature of the fishing—in regard to pilchards more particularly. They will frequently catch pilchards in December, and I have known them to be caught in January in large quantities. They are then devoted chiefly to the supply of the home market, and are not exported. They are not so good then, and they are chiefly employed as bait. They are considered to be excellent bait.

21,329. Then in the latter part of the season does the hand-line fishing begin again?—Some of the men who cannot afford nets go in the hand-line fishing all this time, so that one class of boats change their mode of fishing according to the season, from mackerel to line-fishing, and then to drift-net fishing for pilchards, while there are others which keep at hand-line fishing throughout the whole of the year.

21,330. Then I take it that mackerel, pilchard, cod, and ling are the principal fish you catch?—Yes, with haddock, whiting, and bream.

21,331. In what particular description of fish has the falling off been principally noticed?—There has not been so much falling off noticed with regard to the pilchard, and I will explain afterwards how that is. The falling off has been noticeable particularly in the whiting, cod, ling, haddock, and that class of fish which seeks its food near the bottom, and feeds from the ground mostly. In the conger also the same falling off has been observed.

21,332. Then it is the hand-line fishers who suffer?—Yes, they suffer greatly.

21,333. Has there been any remarkable falling off in the mackerel?—The mackerel is so very capricious a fish that only once in a few years there will be a successful fishing. On the whole, perhaps, there will be no falling off.

21,334. Has there been any falling off in the pilchards?—No, there has been no falling off, but the catch in different seasons will vary a great deal.

21,335. Is it the opinion of the fishermen in general that the falling off in the yield by the hand-line fishing is to be ascribed to any particular cause?—Yes, I think so.

21,336. Then what is the cause?—I am acquainted with an individual who, as a boy, served his apprenticeship on board a trawler in the latter part of the last century. He informed me that at that time there were only three trawlers at Plymouth.

21,337. There are a good many more than that now?—Yes, very much more. How many there are there now I do not know, but the number has greatly increased. There are nearly 100 there now, I think. We often see them here in large numbers, and we ascribe the falling off in the fisheries to the influence of their trawls upon the ground.

21,338. Do the trawlers trawl habitually off your coast?—Yes.

21,339. Is it their common trawling ground?—Yes.

21,340. How far do they work east and west?—The extent over which they trawl is unlimited. They trawl from Polperro Point right away to Bolt Head.

21,341. (*Mr. Lefevre.*) At what distance from the shore do they trawl?—Here we have rocks which prevent them from trawling within a couple of miles, but they trawl anywhere beyond that at any depth.

21,342. (*Professor Huxley.*) Is there a smooth bottom beyond two miles from the shore?—Yes, there is, I think, upon the greater part of the ground.

21,343. (*Mr. Lefevre.*) Do they habitually trawl as near as within two miles of the coast?—I am not aware of the exact distance, but there are fishermen here who can tell you. The reason why I ascribe the falling off in the catch of fish to the trawlers is this:—I will leave out of the question the destruction of the young fish. It is generally thought that young fish in large multitudes are upon the ground when the trawls are principally in action. They are accustomed to go in towards the land from long distances to places where there are a considerable number of flexible corallines to be found. In such places as that the fish I refer to seek to deposit their spawn. It is, therefore, not simply the young fish which are destroyed, but that which attracts the fish to the spawning ground is also destroyed. In studying natural history I have been accustomed to obtain specimens from the bottom of the sea here, and I have found immense quantities of these flexible corals. I believe the fish are guided to a great extent in the selection of their spawning ground by the food which is to be found upon it. They will not come in and spawn upon mere barren ground, and the removal by the operation of trawling of the food upon which they formerly relied, and the destruction of the feeding grounds, are in my opinion the causes why the fish have forsaken the ground.

21,344. (*Professor Huxley.*) Did you ever find any dry spawn among the specimens of which you speak?—Very little.

21,345-6. Then you think that the destruction of the spawning beds is owing to the operation of the trawlers, and that that is the cause of the diminution of the fish?—Yes; there is also another thing which I may mention. I have frequently been in the habit of opening the stomachs of the fish when they have been caught and brought in by the liners, and I have often found a vast variety of fine specimens of crustaceous animals, such as small crabs, in them.

21,347. What fish do you refer to?—Cod, whiting, haddock, and ling. From the ling perhaps not so much, but from the stomach of a cod I have often taken as many as 50 crabs of all sizes. Probably there would have been 50 cod caught at the same time, and if I had examined the stomachs of the whole of them, I should in all likelihood have found that there was not one that was deficient. When that

POLPERRO.
J. Couch.
28 Mar. 1864.

food is destroyed the fish will not come in. These crabs assemble about the flexible corals. That is their harbour, and when the corals are destroyed the consequence is that the crabs cease to frequent the place. It is not the common crab of which I speak, but a large number of crabs of a smaller description.

21,348. You are aware that the trawlers have trawled over this ground for a great many years?—For the last 50 or 60 years they have been trawling there, but 60 years ago there were only three trawlers at Plymouth. They could hardly have done much harm, but it was very different when they reached up to 100 in number. Brixham and other trawlers also come down here in immense fleets, so that they can hardly be counted. Seeing the great extent of coast which they must sweep, I think they must have had an influence such as I have described.

21,349. Are you of opinion that there is any other cause which has led to the falling off in the fish?—I am not aware of any other cause in particular. Of course if a very large number of small fish—the newly-bred fish—be destroyed, that must diminish the general number. It would diminish not simply the number of small fish that would have grown up into large fish, but the number of breeding fish also.

21,350. Have you ever seen the contents of a trawl when it has been brought up?—Not at the time of its being brought up, but I have had the contents of a trawl net brought to me.

21,351. Have you ever seen spawn in the contents of a trawl?—No, I have never seen the trawl actually brought up.

21,352. When the contents of a trawl have been brought to you, have you noticed spawn in them?—No.

21,353. Can you give us any idea of the quantity of fish brought in here in favourable weather? What will be the average yield per boat?—I have known the conger, which forms a material part of the profit of this place—I have known the conger brought in here in as large a quantity as 20 cwt. at a time.

21,354. Do you mean 20 cwt. per boat?—Yes, per boat. Perhaps, taking every day, that would be a very large quantity, but I have known 5, 6, and 8 cwt. frequently brought in. There would often be a conger which alone would weigh from 30 to 40 lbs. They would be 8 or 9 feet long, and as large round as an ordinary sized man. I have frequently seen them from 30 to 40 lbs., and one of 60 lbs. was not at all uncommon. There has been a very great falling off, however, and one weighing 20 lbs. would be a very large one now.

21,355. What do you think would be a fair estimate of the quantity of cwts. of all kinds of fish now brought in per boat?—From 4 to 6 cwt. would be an average quantity per boat in a favourable season.

21,356. (*Mr. Lefevre.*) Is that with the liners?—Yes.

21,357. (*Professor Huxley.*) Of course it is quite apart from the pilchard and mackerel fishing?—Yes, simply line-fishing.

21,358. Then what becomes of that fish when it is brought in here?—There are certain fish—for my own part I think they are the best in the sea—which they do not carry to market at all. The fishermen eat them and preserve them for the winter. People in the neighbourhood are frequently supplied with them, and occasionally they may be carried to Liskeard.

21,359. (*Mr. Lefevre.*) What fish are they to which you refer?—Ray fish, and fish of that class. The people here eat dog-fish, and think it a very favourable fish for eating.

21,360. (*Professor Huxley.*) Is that the spotted dog-fish or the spine-dog?—It is the common spine-dog.

21,361. What is the ordinary market for fish from this place?—A large quantity since the railway was opened goes to London, and a large quantity is sent off two or three times a week to Liskeard, Tavistock, Callington, and other places.

21,362. How do you get it to the railway station?—It is sent up by carts. If there is a large catch of fish, such as mackerel, or of expensive fish from which they hope to get a good return, our fishermen will run into Plymouth without coming here at all.

21,363. Do they think that by doing so they are able to get a better market for it?—They can sell it quicker there.

21,364. I presume that the great proportion goes to London?—Almost all of it goes to London.

21,365. Is the price of fish here at all within your knowledge; I mean its price now as compared with what it was 50 years ago?—Many years ago there was a contract here for sending the fish to Bath. I have known 4*d.* a pound given for good fish then, and now if they can get 1*d.* per pound they think they have got up to the top price.

21,366. Then the price of fish here to the fishermen is less by a great deal than it was formerly?—That has been so here, except since the railway has been opened. The opening of the railway has had the effect of bringing up the price again. The question, however, is one of which I have very little personal knowledge. There are persons here who will be able to give you much better information on such points than I can.

21,367. From your knowledge of the fisheries here are you able to say whether the difference in the price has been such as to compensate the fishermen for the falling off in the take of fish?—In my opinion it has not at all been sufficient to compensate them.

21,368. Then the fishing business must have fallen off very much?—Yes, it has; at one time there was a trade here which is now quite forgotten.

21,369. What trade was that?—I have seen large quantities of conger preserved here dry without salt, and exported to Spain and Portugal. The Spaniards and Portuguese would give 5*s.* or 6*s.* a cwt. for them, and in that way there was a very considerable trade which we have since lost altogether. The conger douce it used to be called.

21,370. Has that falling off arisen in consequence of the scarcity of the conger?—Yes.

21,371. Is there still a demand for it?—I do not know whether there is or not. Perhaps there may be a better demand for conger in the country. Part of the population are very fond of buying conger.

21,372. Then with the falling off you describe I am afraid that the circumstances of the fishing population here have become much worse than they were in former times?—I think so. Within my remembrance it was a common practice for immense quantities—many hundred weights—of whiting to be brought into this place. If they were sold for 6*s.* or more a cwt. they went to the "jolters," as they called the people who carried the fish away and sold it. If it did not reach that price then there were fish carriers who took it regularly, and in that way there were many hundredweights of fish falling into the hands of the carriers every day, or at any rate two or three times a week. Now nobody thinks of it.

21,373. How is that?—On account of the scarcity.

21,374. It has become very scarce?—Yes, very. We cannot get a hundredweight in the course of a month. In former times it was one of the most common things for a family to lay in a little stock of dried whiting for roasting for breakfast. No one thinks of doing that now. In point of fact it would be impossible to do it.

21,375. You do not think that the scarcity of fish here or the market here depends on the draught away to London?—No, I do not think that has anything to do with it.

21,376. So far as I understand your evidence you are of opinion that the scarcity of hooked fish arises entirely from the trawling?—Yes, that is my opinion.

21,377. On the ground that the trawling operations have destroyed the breeding ground?—Yes.

21,378. You were speaking just now of the pilchard fishery, and there was some reservation which you made with regard to it. What was it?—I have records of the pilchard fisheries from the time of

Queen Elizabeth, which have fallen into my hands from traditionary accounts and from the statements of old men who have been engaged in the fisheries. In the early part of my recollection the season at which the pilchards were caught was different from what it is now. There has been a change in the time of carrying on the pilchard fishery from summer to winter. About 30 or 40 years ago the principal fishing for pilchards was in August and September. Since that time it appears to have dropped back again into October and November and perhaps December and January; and so it appears to have been in earlier times. There were intervals of between 30 and 40 years of that sort of transition. There are records of such a transition having taken place two or three times over. I was somewhat surprised a short time since at a fact which was brought to my notice with regard to the herring fishery. I have just been writing the history of that class of fish—the herring, pilchard, and kindred fishes—and I find that there are records of the same kind of transition in the herring fishery.

21,379. Is there any herring fishery here ?—The fishermen here catch them, but not to any considerable extent.

21,380. What time of the year do the herring make their appearance here ?—They may be caught all the year round. They are found in the pilchard nets and are those that are too small to have been stopped by the mackerel seines. They go through the mackerel nets. It is only the very fine large ones that can be caught in that way. We got them here about a foot long. The other day the whole of them that were caught were of that size. I do not suppose, however, that all the herrings on the coast are of that size. Some time ago I got some herrings from Lynn to compare with them, and ours were giants in comparison.

21,381. (*Mr. Lefevre.*) Do you know whether the fishermen here have nets specially for herrings ?—Yes, I believe they have in the large boats.

21,382. (*Professor Huxley.*) Do the herrings come here at any other period ?—They come again at the fall of the year—in about the months of September and October.

21,383. Are they then in more abundance ?—Yes. We never lose them altogether, but they are more abundant in the months of October and November. I waited a good while the other day to get specimens for dissection.

21,384. Have you any January and February herring here ?—Yes, there are some to be had then. Last season I think I was able to get them in those months.

21,385. With respect to the pilchard what is the condition of the fish when it visits this shore ? Is it a full fish ?—The pilchards caught in the months of July, August, and September are in the best condition.

21,386-7. Are they full fish ?—Yes.

21,388-9. In what month particularly are they full? —In the month of October.

21,390. At what other time of the year are they full ?—They are full of roe about March and April—April more particularly.

21,391. Then the pilchard like the herring has two spawning seasons ?—I have no doubt that it has.

21,392. Do they assemble in the early spring months in large numbers ?—I have known in the month of February 50 hogsheads caught at once in a shoal. I may add that they spawn further from the land in the spring than in the autumn.

21,393. Do you account in that way for there not being a regular pilchard-fishing in the spring ?—The fact is that they are so thin in the spring that nobody will eat them. The difference in the quality of the fish caught in one season is very great as compared with those caught in another. In August and September they are very fine, but that is not the case when they are caught in the spring.

21,394. But notwithstanding the fact that they are so thin they are full fish ?—They are full of roe, but our men go and catch them principally for bait. The success of the other fisheries depends in a great measure upon their being able to get good pilchard bait.

21,395. Do you think that the pilchards are here all the year round ?—No doubt there are some to be found here all the year round, but they do not assemble. It is only the straggling fish that are caught all the year round.

21,396. Do you believe that the pilchards migrate ? —I believe that they are so far migratory as to go to a greater depth of water—perhaps 40 or 50 leagues from the shore.

21,397. (*Mr. Lefevre.*) Are they always off the coast ?—Yes. I positively believe that the sardine is on our coast at times in some years.

21,398. (*Professor Huxley.*) Do you hold that there is any difference between the sardine and the pilchard ?—I hold it to be a different species. I have not, however, been able entirely to satisfy myself upon the point, but the preponderance of my opinion is in favour of the sardine being a different species.

21,399. You know that M. Valenciennes thinks to the contrary ?—Yes, and Cuvier also thought to the contrary, and he was a capital authority, but I have noted some marked points of difference. I have already detailed some of them. They do not come every year, and there have been some years in which a particular sort of fish has been here that nobody could make anything of at all. Now I believe that they have been the sardines. I have tried to get a real specimen of the sardine from the Mediterranean but I have not yet succeeded, so that I can only compare our own fish, without knowing whether they are what would be called sardines in the Mediterranean.

21,400. Have you noticed any difference in the size or appearance of the spring pilchard and the autumn pilchard ?—There is a difference.

21,401. What is it ?—The autumn pilchard has its fat—the oily part—mixed with the muscle. In the spring pilchard there is no fat mixed with the muscle. There is a very little bit of fat at all, and what there is is in the entrail.

21,402. In the mesentery ?—Yes.

21,403. Does the difference to which you refer in the case of the spring pilchard and the autumn pilchard depend, as in the case of the herring, on the amount of food it gets ?—Not altogether, I think. I have no reason to think that there is any difference in the food they get in the spring; but there seems to be something in the nature of the season, as the thinnest fish in the autumn have a great deal of fat mixed up with the muscle.

21,404. I presume that in the course of your experience you have dissected a great number of pilchards ?—Yes.

21,405. When the fish are full do you ever find any fat in the mesentery ?—Yes, in the mesentery and in the muscle too.

21,406. When they are full ?—Yes, our people when they preserve the pilchards take the entrails out. I have frequently examined them to look for ova, and I always found a clump of fat mixed up with it.

21,407. When the herring is full do you not find that the fat has gone from the mesentery ?—Yes, but they are a different fish. They are not half so good as a pilchard.

21,408. Are your spring and autumn pilchard of the same length as the herring ?—They are of the same length but not of the same bulk. A herring will always weigh down a pilchard of the same length. The other day I put a herring and a pilchard in the scale opposite each other, and although the pilchard looked the larger fish the herring was the heavier.

21,409. (*Mr. Lefevre.*) Is the mesh of the net used by the fishermen here for catching the pilchard the same as the mesh of the net used in catching the herring ?—No, the meshes used are different.

POLPERRO.

J. Couch.

28 Mar. 1864.

21,410. Which is the largest?—I am quite sure that the whole box of herrings I received from Lynn the other day were smaller than any pilchards which I find commonly caught here. They could only be caught by the use of a very small mesh. According to an account published lately, especially with regard to the herring, it would seem that in almost all the districts in which the herring is caught they get a different size and appearance of fish. That might make some difference and prevent a uniform mesh being used. All the herring caught here are as long as this (*measuring*).

21,411. (*Professor Huxley.*) Have you carefully examined the herrings with regard to their spawning?—That is a point upon which I cannot speak so confidently.

21,412. At what time of the year are they full fish here?—This very year—but whether it is an exceptional year or not I do not know—they have all been very large with spawn throughout the winter. In December, January, and February they were quite large. I had a letter from Lynn stating that the same thing had occurred there, but it seems to have been regarded as an exceptional circumstance.

21,413. Do you get full fish here in August?—I can scarcely say. The herrings here then are not full. There is nothing in a herring in August.

21,414. (*Mr. Lefevre.*) Did you notice that the falling off in the fish to which you have referred, namely whiting, cod, ling, and so on, took place all at once or was gradual?—There has been a gradual falling off for the last 50 years. Of course there are variations in all kinds of fishing. One year will be much better than another, but taking the long run of 40 or 50 years the falling off has been gradual.

21,415. And during the same length of time I understood you to say that you had observed an increase in the number of trawlers?—That certainly has been the case, but whether the two things together are to be considered as cause and effect, or as a mere accident, I cannot say—still the fact is so.

21,416. Are you aware that the trawlers do not complain of any falling off in the quantity of fish they catch?—I am not aware.

21,417. I think we may fairly assume that their numbers would not have increased if there had been any falling off in the fish they catch?—The person I spoke of was a person of strict veracity, and his statements were not made to me with any idea of finding fault. He was one of the Coastguard at the time.

21,418. Do you think it is not possible that the trawlers now catch fish which used formerly to be caught by your own fishermen?—I do not think that that is the probable cause. I am much rather inclined to impute it to the destruction of the breeding grounds.

21,419. Do the trawlers off this coast catch the same kind of fish as the line fishermen?—I think not, and I will give an explanation. Sometimes no doubt they catch the same sort of fish as those which our men catch. I understand, for instance, that they catch immense quantities of hake. So far they catch in common, but the remarkable point is that they take the hake in by thousands at a time when our men cannot catch one. The hake loses its appetite when going to spawn. It is a most voracious fish nearly all the year through, but it loses its appetite in January and February, and then is the time that the trawlers catch more than at any time of the year. They carry them into Plymouth.

21,420. Do the hand-line fishermen fish at the bottom of the sea? Is the bait on the bottom?—It is near the bottom, perhaps within a fathom. They draw up the hand-line a little more, but the fish are near the bottom.

21,421. So that the trawlers get the same fish occasionally?—They do not catch the same fish as those who use the hand-lines. For instance, the trawlers take large quantities of soles, but I never knew more than one or two soles caught by a hook and line.

21,422. Are turbot caught by the line-fishermen?—Turbot we have more frequently, but not in any considerable quantity. In fact the sole feeds by night and in bays. If our men go out to a long distance where the trawlers fish they will not catch soles. They use immense large conger hooks.

21,423. Too large for the sole?—Yes; that may be one reason our men fish by night.

21,424. The trawlers in this part mostly fish by day?—Unfortunately they do not. They frequently run across the nets without caring what becomes of them.

21,425. The Plymouth trawlers mostly go into harbour by night, do they not?—No, and when they commit damage by night our men are unable to convict them because they cannot see their numbers.

21,426. Is it not the rule for them to go in at night?—If they have a cargo of fish they will run in with it, but I hear complaints continually that the trawlers get among the men by night. With regard to the pilchard-fishing there is one subject upon which I should be glad to make a remark. I have received a letter from some fishermen at Mevagissey calling my attention to certain grievances of which they complain, and in the answer I returned to them I requested them to appear there before the Commissioners. It seems that there is a quarrel there between the seiners and the drift-net people which originated several years ago. They accuse each other of destroying the fishing. The law is, as you are probably aware, that by an Act of Charles II. the drift-net fishermen are not allowed to come within a league of the land, which is considered very oppressive, particularly as no seine can be shot on a good deal of our rocky coast here. The consequence is that the pilchards may come here and yet the drivers are not allowed to go in after them, and the public are the losers, because the drivers can catch fish when the seiners cannot. I am told that the Government, in consequence of some representations that were made to them, issued some order to the Revenue cruisers directing them to take possession of all drift-boats fishing within the distance mentioned in the old Act of Parliament I have referred to. The consequence was that a correspondence was entered into and meetings were held. I was chosen by the fishermen to be their president, although I had no interest whatever in the fishing. I had a correspondence with Lord Eliot, the present Earl St. Germans, who was then member of Parliament for this division of the county, on the subject, and in consequence of the representations which were then made, the order was withdrawn, and the drift men were permitted to fish within a mile of the land except where the seiners were engaged. I have a copy of the whole of that correspondence at home, and shall be happy to place it in the hands of the Commissioners if it is likely to be of service.

21 427. It does not affect this place I understand?—Yes, it does, very materially. It applies to the question of the pilchard fisheries generally.

21,428. I thought you said there was no seining on the coast here?—There are seines at Looe. This letter was sent to me on Saturday requesting me to say something about the matter. The disputes were all ended with us in consequence of the new regulation permitting the fishing within a mile of the shore. I thought that the whole grievance had ceased to exist all along the coast, and that it was dead and gone, but it seems that I was mistaken. This letter has been sent to me, and I beg to hand it to the Commissioners.

21,429. (*Professor Huxley.*) Do you put it in as evidence?—Yes.

21,430. (*Mr. Lefevre.*) Is the gentleman who writes to you likely to give us evidence at Mevagissey?—Yes. I think so. I requested him to make his appearance there.

21,431. (*Professor Huxley.*) I understand, from what you have stated, that any regulation that would have a tendency to put down driving for pilchards

here would be injurious to the place?—Yes, it would be the ruin of the place.

21,432. It would be utterly disastrous to the fishing population here?—Yes.

21,433. For the simple reason that it is impossible for you to seine here?—Yes, quite so. Besides we frequently hear a great deal said of the exportation of pilchards. Now the average extent of exportation from this country is 30,000 hogsheads a year. Sometimes it is much more, but no account is taken of the quantity consumed by the people in the country. It is the common food of which the labouring people, farming people, and townspeople lay in a stock, so that they may have something to eat when the boats cannot go out to sea. All this is derived from the drift fishery, and if it were not for the supply provided by the drift boats many of the lower classes would starve. The mining population and nearly all the lower classes have their stock of pilchards, and not only those but respectable people do the same, for their servants and families. There is not a child here who would not be satisfied with having a roasted pilchard for breakfast.

21,434. Do you think that the seining would not supply the people here?—I do not think it would.

21,435. Upon what ground do you arrive at that conclusion?—Because they have found it unprofitable to go seining at all. If the seines had paid well and proved profitable the owners would not have got rid of them, and instead of having decreased they would have increased in number.

21,436. Why did they have seines at all when they had no use for them?—Because the fishery at that time was principally carried on in the winter, and now it has changed from a summer to a winter fishing.

21,437. The fish, then, have changed their season for visiting this coast?—Yes. The fish which formerly were so abundant that from 500 to 600 or 800 hogsheads were caught at one single shoot of the seine in the months of July, August, and probably September, and sometimes the first half of October, now visit us very much later. In fact those fish which we used to take in these months do not now come here at that time.

21,438. Why should they be able to use the nets at one time of the year and not at another?—I do not know why, but I know that from some cause or other the fish have undergone the transition that I have described.

21,439. But why is it not possible to catch them in the seines at one time of the year as well as at another?—Perhaps you are not aware of the mode in which they act in the seine fishing. When the seine is shot, if the enclosed quantity of fish amounts to 40 or 50 hogsheads, they put the tuck seine under it and take the fish out. Two boats, which will be sufficient to take the fish when they amount only to 30 hogsheads each, find it impossible to take up from 100 to 500 hogsheads. It is necessary, therefore, to let the seine be moored with the fish still enclosed in it, and if a gale of wind came on in the night in all probability it would destroy the nets and ruin the fishermen. You must bear in mind that a net of this description costs the fishermen 800*l*. I have heard of instances in which the fishermen have been engaged a whole week in taking out the fish after they had been enclosed in the nets. If anything happened to injure the nets or to destroy them, it would have been the ruin of all the parties concerned.

21,440. (*Mr. Lefevre.*) I suppose that in the fine weather in the summer you can allow the nets to remain out with safety?—Yes, there is very little danger then. I have heard an instance in which after the seine was shot and the fish enclosed the fishermen found that they had no salt; they therefore sent a ship down to the Bay of Biscay to bring up a cargo of salt. They brought up the salt and managed to save the cargo of fish afterwards.

21,441. (*Professor Huxley.*) Then it is not on account of the nature of the bottom, but because the time when the fish visit this coast has changed to a much later part of the year, that the pursuit of seine fishing is in your opinion attended with hazard?—Exactly so.

21,442-3. (*Mr. Lefevre.*) At what distance from the shore do the fishermen set their drift nets?—At all distances. You will see one long line of drift nets from Mevagissey right across for six or seven miles.

21,444. (*Professor Huxley.*) How far out can seine nets be used?—Only a very little way. There used to be 40 seine boats at Mevagissey and four drift boats, but now they have only 14 seine boats and 40 drift boats.

21,445. Can the seine boats work out at sea?—No; they might be used within a certain distance of the shore.

21,446. (*Mr. Lefevre.*) Do they often shoot the drift nets within two miles of the shore?—Yes; they shoot them wherever there is any chance of taking fish.

21,447. Does it often happen that the pilchards are found within such a short distance of the shore?—Yes.

21,448. Then in your opinion would any regulation prohibiting the use of drift-nets within a short distance of the shore be disastrous to the fishery here?—Yes; but there are certain parts eastward of Looe where there is clean ground. They never draw the seine nets ashore. From the Land's end to Plymouth they never draw the seine nets ashore.

21,449. To the northward do they draw the seine nets ashore?—It is only very rarely they do. The land is so very steep here that they could not warp the seine in.

21,450. (*Professor Huxley.*) Are you aware that in various parts of Cornwall complaints have been made, especially on the other side, by the seine fishermen of the mode of fishing adopted by the drift-net fishermen?—Yes.

21,451. It is asserted by the seine men that the drift-net fishermen destroy the fishing?—Yes, I believe it is.

21,452. Can you tell us anything about it?—I do not believe that they do as much injury as they are said to do. Of course if they were to shoot their nets where the seine men are fishing it would be wrong and ought to be prevented. There are only certain places on the coast where the seine can be shot, and in those places there are regulations now observed. There are certain spaces along the coast which are called turns; the regulation is that the first seine which arrives at that spot shall have exclusive possession of it for a certain length of time. No other seine is allowed to intrude there for the space of 24 hours unless the fishermen in possession of the turn happen to get a catch of fish, and then their turn is ended.

21,453. Does the next in order take possession of the turn in that case?—Yes.

21,454. Then are we to understand that the coast is divided into these turns?—There are only certain places where the seine can be shot, and these parts are called turns. The seiners themselves are not permitted to go among those who are there; if one goes out to wait his turn he will drop his anchor outside, and although he may see the fish there he is not to proceed to shoot among them until his time arrives for taking possession of the turn. I think that the drift men ought not to be permitted to go near the turns, and I see no reason why all the real seining ground where seines would be eligible should not be divided into turns.

21,455. What distance do you think the drift fishermen ought to be kept from where the seines are used?—I think that if there were a regulation enforced that no drift fishermen should come within two miles of the ground divided into turns that would be quite sufficient.

21,456. Are you aware that it is stated by the seine fishermen that the mere fact of drifting at all breaks the shoals of fish and disperses them?—That is the

POLPERRO.

J. Couch.

28 Mar. 1864.

very point upon which I had a correspondence with Lord Eliot. The question is who shall really catch the fish, whether one is to be allowed to break the shoal or the other to catch the whole of it.

21,456*a*. But as a matter of fact do you agree with the opinion expressed by the seine fishermen that drifting breaks the shoal of fish?—I do not believe that it does. I have seen the shoal of fish within half a mile of the land visibly rippling upon the surface of the water; I have seen the drift-net fishermen cut across that shoal, and I have seen the pilchards on the lee side just as perfect. They must have gone under or over, but without being stopped at all by the shooting of the nets.

21,457. Then that is positive evidence that under certain circumstances the shoal is not broken?—Yes.

21,458. (*Mr. Lefevre.*) Have you any suggestion to make with regard to the trawlers? Do you think that there are any regulations affecting the trawlers that ought to be imposed?—I think that the trawling has now become far too wide an interest to be interfered with unnecessarily. They catch an abundance of fish which no one else would catch; they therefore form a very valuable interest, and one which ought to be supported. The trawl boats likewise form an excellent school for the training of sailors. Under these circumstances anything that I could say as to imposing restrictions upon their fishing must be taken with the utmost reserve. At the same time I think that if they were prevented from trawling by night it would be satisfactory. Of course the distance from land within which they may fish should be observed as it now exists. They ought not to be allowed to come close in-shore.

21,459. (*Professor Huxley.*) What distance would you keep them off the shore?—I am not prepared to say.

21,460. Are there not rocks within two miles of the shore?—They cannot come in here, and they cannot come in to the north-east of Looe. In Lantivet Bay, between this and Fowey, the trawlers can go in very close, indeed they can run in and out of that bay easily, and I think they should be prevented from trawling by night.

21,461. Why do you think they should be prevented from trawling by night?—I think so for a double reason. In the first place, because if they commit any infringement of the law they could not be convicted. Nobody could see the numbers of the boats, and therefore whatever they did it would be impossible for them to be detected.

21,462. Such a regulation as the one you propose, namely, preventing them from trawling by night, would do very well in a place like Plymouth, but how would it affect the trawlers generally?—If they were trawling by day, and did anything contrary to the law, it would be easy to see who they were, and they would be convicted, but now they can do as they please without running any risk of detection.

21,463. Is there anything you wish to add to the evidence you have already given?—Nothing.

21,464. (*Mr. Lefevre.*) On the whole do you think that the wages of the fishermen have fallen off?—They have no wages.

21,465. Has what they make by share fallen off?—Of course it must, if a large proportion of their profits has fallen off. The plan they adopt here is for the men to go shares in all cases.

21,466. How do they divide the shares?—The boat has a share, and the nets also.

21,467. It is divided into shares?—Yes, but I think they are not all equal shares. The fishermen, however, will tell you much more about it than I can. The old seining plan was to pay by wages, but no fishing will ever prosper where the men depend upon wages only.

21,468. Taking the last 50 years, do the men make on the whole less now than they did formerly?—Yes, considerably less.

21,469. Notwithstanding the advantages they now possess in having the railroads?—Yes, the profit is so much smaller than it used to be. In the winter time they suffer most. Perhaps this year has been an exceptional one. For six months now they have been hindered from going to sea, but taking them as a whole the profits of these men are considerably less than they were in former years. As a proof of this, I am aware that a large proportion of them, as soon as they get sickly or aged, are obliged to go to the union.

21,470. Does the surplus population go off to other places?—We have a large number of men from this part in the navy and in the mercantile service. During the late war with Russia there were 70 persons there belonging to these parts, and the greater part were serving in the fleet.

21,471. I think I understood you to say that the population has remained about stationary during the last 50 years?—Yes.

21,472. Then what becomes of the surplus population?—It has gone eastward and westward. We do not lose many by drowning. It is rather remarkable the few losses we have in that way.

21,473. Do you think that the surplus population have gone to Plymouth and other fishing places?—They are scattered all over one hardly knows where. There are a great many in the mercantile service, and a great many in the navy.

The witness withdrew.

GEORGE BRINE, R.N., called and examined.

G. Brine.

21,474. (*Professor Huxley.*) You are, I believe, the Inspecting Commander of the Coastguard here?—Yes.

21,475. Are you anxious to make some statement?—All I wish to say is that I consider the drift-net boats are absolutely necessary for keeping up the supply of pilchards to the population of Cornwall. If it were not for the fish caught by the drift-boats the people here would absolutely starve on many occasions. They could not exist for a month in the winter time without the drift-boats. The seine boats belong principally to the wealthy proprietors, such as Messrs. Fox of Falmouth, and a few others. The fish they catch in these large seines they salt down, and export abroad. The fish caught by the drift-boats is used for the support of the population. To my knowledge there are people now in Mevagissey who in consequence of a partial failure in the pilchards have almost exhausted their supplies. They are, in point of fact, half starved, and are living from hand to mouth on what they can get. If the drift-boats were stopped altogether these people would be placed in a very unfortunate position. As I have already stated, the seine boats are in the hands of a few parties at Mevagissey and other places, but the drift-boats are very differently situated. They bring in a very large supply of fish, and everything they bring in is sold for consumption here; but what the seiners bring in is salted down in the cellars, and afterwards exported abroad to Spain and Portugal.

21,476. Then do I understand you to say that the drift-boats are the principal support of the fishermen, and that what fish they obtain is supplied as an article of food for the people?—Yes, it is the principal support of the miners. I see them frequently going through St. Austell. They bring their fish from the northern parts of the country, each having his cask of pilchards laid by for a supply of food in the winter.

21,477. I presume that they would not be able to get that if the drift-net fishing were put a stop to?—They would not be able to get it at all. Last year the Mevagissey people did not get enough in their boats to supply the population. I was down there looking on at the time, and saw the only haul they had. Perhaps the drift-boats interfere a little with the seine-boats. If they start from here, for instance, and run across the bay, there is a probability that

POLPERRO.

G. Brine.

28 Mar. 1864.

the fish would become broken and the net would separate.

21,478. Do they interfere with the seine-boats more than one branch of trade generally interferes with another?—I do not see that the drift-boats interfere much with the pilchards. I may say that at Mevagissey, where they formerly used to have a great number of seine-boats, and a small number of drift-boats, they now have 40 drift-boats, and not more than five or six seine-boats.

21,479. You know the Convention which exists between this country and France?—Yes.

21,480. Do your instructions as Inspecting Commander on this coast oblige you to look sharply after the enforcement of the regulations laid down in that Convention? Do your instructions oblige you to see that those regulations are carried out?—No, not here. They have a cutter here. There is no regular Revenue boat here, but they have a kind of Revenue vessel attached to the Coastguard service. I have a little tender, but no regular crew.

21,481. Do you consider that you are bound to examine any of the nets?—There is an officer on the Looe station whose duty it is principally to look after the river fishing.

21,482. I am not speaking of the river fishing now, but only of the sea fishing?—I have no instructions with regard to that.

21,483. Is it not a fact that the Convention is practically a dead letter so far as you are concerned?—Yes, with the exception that we have been spoken to once or twice, and asked why we do not put a stop to the drift-boats, and make them go further off the coast.

21,484. Who are the persons who have complained of the drift-boats?—The complaints have been made by persons connected with the seine-boats.

21,485. The Convention would give you no power to do that?—No, but these people have an idea that the drift-boats ought to be stopped. I declined, however, to interfere with them.

21,486. (*Mr. Lefevre.*) How far does your station extend?—From Blackrock two and a half miles the other side of Looe down to the Falmouth side of the Deadman Point.

21,487. Is there any other fishing village besides Looe between Polperro and Plymouth?—There is a place called Wrinkle, but I should not think there is much fishing carried on there.

21,488. Is that in Whitesand Bay?—Yes.

21,489. Then there is nothing between Cawsand and Looe?—No, I think not. On the other side there are two steamboats belonging to a man named Nichols at Fowey, but they did not catch fish last year.

21,490. What place is there between Fowey and Mevagissey?—There is Polkerris. There are one or two seine-boats there, I believe, and a little trawling-boat; it is only a small punt.

21,491. Where is Polkerris?—It is near Fowey.

21,492. You say there is nothing at Fowey itself?—No.

21,493. What is there westward of that?—There are one or two seine-boats at Charlestown, and then Mevagissey is the next place. You need not go to Gorran Haven. At Mevagissey I think there are a good many fishermen.

21,494. Between that place and Falmouth is there any fishing of importance?—I believe they have a few seine-boats at Porthloe.

21,495. (*Professor Huxley.*) Have you ever had any complaints of the trawlers having fallen foul of the drift-net men?—No, I have never heard any complaints whatever made about the trawlers.

The witness withdrew.

JONATHAN COUCH recalled and examined.

J. Couch.

21,496. (*Professor Huxley.*) You wish to make some addition to your evidence?—Yes, I wish to add a word or two. One reason of this particular feeling of enmity between the seine fishermen and the drift fishermen is this. When it was found that the seiners began to fall off in the catching of the fish, and that the profits consequently became less, a large number of the most regular fishermen left the seine-fishing, and went to the drift-nets. The seine men have not been able to get their services back again. The consequence has been in some cases that the seine-boats have been left without their proper crews. A large portion of the men who go with the seine-boats are tradesmen—shoemakers, masons, and others, who only follow the business of fishermen during two months or so, while the seine-fishing is on; therefore they are not proper seamen or fishermen at all. The seine owners, however, endeavour to obtain the services of a certain number of regular fishermen to manage their boats. When they found that these men could not be obtained, an additional feeling of ill-will was created.

The witness withdrew.

CHARLES WILSON RILEY called and examined.

C. W. Riley.

21,497. (*Professor Huxley.*) You are a captain in the navy, I believe?—Yes.

21,498. Have you been long residing at Looe?—For the last 20 years.

21,499. Are you intimately acquainted with the population there?—Yes.

21,500. I believe you are anxious to make some remarks in reference to the fishing interest there?—Yes, I only wish to make a remark or two in reference to what has fallen from Captain Brine. He said if the drift-boats are stopped it would be the ruin of the fishermen. Now I beg to add a word to that, and I wish to say that if they are materially interfered with they would be ruined. It is not the stopping of them alone, but any material interference with them would be the ruin of them, and also the ruin of their families.

21,501. In what way should they not be interfered with?—There should be no interference with them regarding where they should fish. I am in a position to know that they do not commit the amount of damage to the seine-boats which has been alleged now. In 1850 we had three seine-boats at Looe; there used to be five, but there are only three now. On one particular occasion they shot their nets, and enclosed about 1,000 hogsheads of pilchards; 300 hogsheads were landed that night, but before the night was over the seiner was moored, and two watch boats were placed in position to look after it. In the middle of the night the Plymouth trawlers came to the place. They were hailed by the Looe boats, and requested not to go over the net as there were 700 hogsheads of fish in it. They however made use of very blackguard language, and got quite across the net. They tore it, and the whole of the fish went away. Now, if it had been a number of drift-boats that had done this they would have obtained the names of the fishermen. I wrote to the Admiralty about it, to the Secretary of the Admiralty, and requested that a revenue cutter might be sent down immediately, and the crew was off and on for two months. The trawl-boats kept out then, but all the mischief had been done.

21,502. The persons who committed this damage were amenable to the common law, were they not?—Yes, but what the fishermen said was this: If we go to law we shall only sustain a greater loss. There is some law I know about the drift-boats not being allowed to come within two miles of the bay; but if

POLPERRO.

C. W. Riley.

28 Mar. 1864.

the law were strictly adhered to our men would lose the greater part of their season.

21,503. Can you tell me where the law you speak of is to be found?—There is a law about the boats not coming within a certain number of miles. I believe it is that they shall not come within two miles of the headlands, and if that were carried out it would be very injurious to the interests of the fishermen.

(*Dr. Couch.*) I believe the law which Capt. Riley refers to was passed in the reign of Charles II.

21,504. (*Professor Huxley to Capt. Riley.*) Is it not an obsolete Act?—No, I think not. But if that Act had been carried out to the letter our fishermen would have made no season whatever last year. They had been out for a month, and then they laid their boats up for a fortnight when their fish struck in. The drift men took from 20,000 to 30,000 fish the very night the seiner was laid up, all of which would have been lost but for the drift-boats.

21,505. One of the special points for us to inquire into is whether there are any legislative restrictions in existence which, if carried out, would be mischievous to the fishing interest. I understand from you that if this enactment were carried out it would be injurious to that interest?—Yes, it would destroy all our fishing altogether if our drift-boats were obliged to keep outside certain limits. The whole of the fishing interest here would be ruined.

21,506. Then is it your desire that you should not be meddled with?—Yes; when the seine-boats are out the drift-men are careful not to go and interfere with them; but the seine-boats only shoot their nets by day.

21,507. Are you aware of the trawlers having done any mischief to the drift-men?—Yes, frequently. We used to have a good salmon fishery at Looe.

21,508. Do you mean a sea salmon fishery?—Yes, and river also.

21,509. The river fishing we have nothing to do with.—The mines here have utterly destroyed that.

21,510. (*Mr. Lefevre.*) I believe you live at Looe?—Yes.

21,511. How many fishermen are there there?—About 180 I think.

21,512. As many as 180?—Yes.

21,513. How many boats have you?—Twenty-one large boats and seven open boats.

21,514. Have you paid much attention to the fishery for several years past?—I cannot say that I have, but I have taken an interest in it for the sake of the fishermen.

21,515. You cannot tell us what the increase or decrease in the fishing has been of late years?—I think I might give you some information on that. Really and truly the fish appeared to me to have very much fallen off. Ten years ago I could always have a whiting on my table for breakfast, now we can seldom see one. In point of fact the fish appear to have fallen off very much.

21,516. How is it then that the number of fishing boats has increased in many of those places?—The fishing has been kept up, I believe, because the price the fish will fetch in the London market has become so much larger. The railroad now takes them all away. We used to be able to get lobsters for eightpence each, now we are obliged to give half-a-crown for one. They all go to London.

21,517. Is the decrease you have observed mainly noticeable in such fish as mackerel, cod, whiting, and ling?—Our hook-boats do not think they bring in one-half the fish they used to bring in formerly, but the fishermen will be able to give you better information on those points than I can.

21,518. Are there any Looe fishermen here?—Yes.

The witness withdrew.

R. Little.

RICHARD LITTLE called and examined.

21,519. (*Professor Huxley.*) Are you a fisherman at Looe?—Yes.

21,520. How long have you been fishing there?—25 years.

21,521. Is the population of Looe almost entirely a fishing people?—I think about one-third of the population of Looe are engaged in fishing.

21,522. What is the employment of the rest?—There is a great deal of shipping; they ship the copper ore and coal. There are two Looes, East Looe and West Looe, and we have altogether a population of 2,000.

21,523. I am speaking now of both Looes. How many fishermen are there there altogether, do you think?—About 120 who are connected with the fishing at one period of the year, and about 200 at the other period of the year.

21,524. How many boats are there there?—There are 21 pilchard drift-boats.

21,525. Are they of the same make as that of the boats here?—Yes, about the same.

21,526. About the same tonnage?—They will average about 15 tons. There are some of them 18 tons.

21,527. What would be the cost of a boat of that sort?—About 240*l.*

21,528. Do you mean fitted with gear and all?—Yes.

21,529. Has the number of boats increased to any extent since you have been fishing there?—Yes.

21,530. How many were there there 25 years ago?—There were then about 12 pilchard boats, and they were smaller than those they have now.

21,531. How many were there of other kinds?—I should think there were about nine or ten hake boats.

21,532. In what has the increase been? Has it been chiefly in the pilchard boats?—Yes, in the pilchard boats.

21,533. (*Mr. Lefevre.*) Are the pilchard boats not used during the hake season?—They are only used during two months of the year, namely, April and May.

21,534. (*Professor Huxley.*) You are a practical pilchard fisherman?—Yes.

21,535. What is the length of your fleet of nets?—Half a mile.

21,536. Are they mounted like herring nets?—Yes, just the same.

21,537. With buoys, head-lines, and so on?—Yes.

21,538. What is the size of the mesh of the net?—It will run from 38 to 40 to the yard for pilchards.

21,539. Is there any regulation as to the size of the mesh? Can you have it as large as you like or as small?—No, we could not catch pilchards if we did that.

21,540. But are you by law allowed to use any sized mesh you please?—Yes, I think so.

21,541. You have nobody to interfere with you?—Not that I ever heard of; but I have heard that there is somebody trying to interfere with us, and that is partly why we have come here.

21,542. Do you mean to interfere with your pilchard nets?—Yes.

21,543. On what grounds?—They say that we catch too small pilchards.

21,544. Has that agitation been going on for some time?—I have only heard of it for the last 12 months.

21,545. Do you fish for herrings?—Yes.

21,546. What sized mesh do you use for them?—35 and 36 to the yard.

21,547. Have you heard of any regulation limiting the size of the mesh of the herring net?—No.

21,548. You have never heard of a law to that effect?—No.

21,549. Nobody interferes with your nets?—No.

21,550. Do you shoot your nets for herrings in the same way as you do in the pilchard fishing?—Yes, quite the same.

21,551. Do you go out during the day, or do you fish during the night?—We follow the night fishing; we generally shoot when the sun is going down.

21,552. For what reason do you do that; is the take better?—Yes, we should not catch the fish by day.

21,553. Then you pursue the same course as with herrings?—Yes.

21,554. And you fish much in the same way?—Yes, just the same.

21,555. What is the length of a fleet of pilchard nets?—It is half a mile.

21,556. How many nets are there in a fleet?—21 nets.

21,557. How many fathoms do they hang down vertically?—Seven fathoms if we let them hang, but they are about five fathoms, being gathered in a little.

21,558. Do you let them drift all night?—That is according to the manner in which the fish go in after dusk; we try them, and if there are fish in them we take them on board, if there are not we let them remain down longer.

21,559. Do you have your boats lighted at night?—Yes.

21,560. What kind of lights do you carry?—We carry a large square lantern, 15 inches one way and 11 inches the other; and we also carry a flare-up.

21,561. Have you one light above another?—We have only one fixed light; if a vessel comes too near then we show the flare-up.

21,562. Then you do not carry two lights one above the other?—No.

21,563. Have you ever heard of this regulation: "In order that boats fishing with drift-nets may be "easily recognized at night, the masters of these boats "shall hoist on one of their masts two lights, one "over the other, three feet apart. These lights shall "be kept up during all the time their nets shall be "in the sea between sunset and sunrise." Did you ever hear of that?—No.

21,564. Did nobody ever try to enforce it?—No.

21,565. Were you not aware that that was the state of the law?—No.

21,566. And that you might be brought before the magistrates for not doing so?—No.

21,567. Do you think it practicable to enforce that regulation?—No.

21,568. Do you carry any particular kind of vanes on your mast?—No.

21,569. You never trouble your heads about that?—No.

21,570. Did you ever hear of this regulation: "For "the purpose of distinguishing by day drift-net fishing boats from trawl-boats, both shall carry at the "masthead vanes which shall be at least eight inches "in height and two feet in length; the colours of "these vanes shall be for British trawl-boats red, "for French trawl boats blue, for British drift-net "boats white and red, and for French drift-net boats "white and blue. It is understood that the vanes of "the drift-boats shall be divided vertically into two "equal parts, of which the white shall be the nearest "to the mast." Did you ever hear of that?—No; something was said about it three or four years ago, but it never came to anything.

21,571. Everyone then does as he pleases?—Yes, pretty much so.

21,572. Do you fish for herrings?—Yes.

21,573. Do you keep up any particular kind of lights when you are herring fishing?—No.

21,574. Did you ever hear of this regulation: "The "meshes of all nets used for herring fishing shall not "be less than one inch square from knot to knot along "the line." Have you ever heard of that?—No.

21,575. Nobody has tried to enforce it?—No.

21,576. Do you think any good would result from enforcing it?—That is about the size we use.

21,577. You adopt that size because you can catch the largest quantity of herrings in nets with such meshes?—Yes.

21,578. Are your herring-boats decked?—They have what we call a cudos.

21,579. Do any of the decked herring-boats come amongst you?—Some of the Mounts Bay boats do.

21,580. Are they decked?—I believe they have about 50 of them decked.

21,581. Do they drift faster than the undecked boats?—I think it makes a little difference. We generally fancy that the Mounts Bay men drift faster than we do. They generally shoot a little athwart the wind.

21,582. (*Mr. Lefevre.*) Are they larger boats?—Yes.

21,583. What is the difference in the size?—Their boats will be about 30 to 35 tons.

21,584. (*Professor Huxley.*) If the Mounts Bay men come up when you are going to shoot your nets do they shoot theirs among yours?—Yes.

21,585. Where they like?—Yes.

21,586. And when they are fishing do you go amongst them?—We never go to Mounts Bay fishing.

21,587. But do you do that in your neighbourhood?—Yes.

21,588. You shoot among them as you like?—Yes.

21,589. Then have you never heard of this regulation: "Whenever decked herring-boats and undecked herring-boats shall commence shooting their "nets at the same time, the undecked boats shall "shoot their nets to windward of the decked boats, "except they should prefer going to leeward to a "distance of at least half a mile to shoot their nets. "The decked boats on their parts shall shoot their "nets to leeward of the undecked boats, unless they "prefer going to windward to a distance of at least "half a mile to shoot their nets." Have you never heard of that?—Yes, I have heard of that law, but I do not know that it has ever been put in force.

21,590. In point of fact nobody pays any attention to it?—No, they shoot when and where they think proper.

21,591. Do you think it would do any good to enforce that regulation?—No.

21,592. Are you of opinion that no advantage would be derived from observing that regulation?—Yes.

21,593. You do not practically interfere with each other?—We get foul sometimes, and then we do the best we can.

21,594. The undecked boats get foul sometimes?—Yes.

21,595. You do not get foul more frequently because of there being decked boats among you?—No, I do not think that that makes any difference.

21,596. You spoke of the interference of the trawlers?—Yes.

21,597. Have you ever had your nets destroyed by the trawlers?—Yes.

21,598. That has occurred in your own case?—Yes.

21,599. How long ago?—Two years.

21,600. Will you state what happened?—We went off Plymouth with 300 sail of boats at the hakeing time in the month of October. When we came to haul in we found that the trawlers had trawled over our nets, and had cut them right in two.

21,601. Were you fishing for hake with nets?—We were catching pilchards for bait for the hake.

21,602. And they trawled after you?—Yes.

21,603. Had you your lights up?—Yes.

21,604. Did they know you were there?—They could see our lights.

21,605. Did they know you had your nets out?—Certainly, they could not help knowing it.

21,606. Do you think the damage was done simply because they would not take the trouble to haul up?—Yes.

21,607. Has that happened when you were fishing for herring and mackerel?—No, we have no mackerel drift-nets at Looe. It is mostly confined to the seining boats.

21,608. Did you ever hear of this regulation: "Trawl-fishing is forbidden in all places where there

POLPERRO.

R. Little.

28 Mar. 1864.

" are boats engaged in herring or mackerel drift-net " fishing ?"—No.

21,609. Were you not aware that that was the law? —No, I never heard of it.

21,610. Would that regulation meet your views with respect to the injury done to your nets ?—Yes, I have known sometimes, and the trawlers knew it well, that boats were drifting, and if they were not going to trawl under other circumstances they would set down their trawls, and I have known them drift foul of our nets during the night. I have sometimes seen a vessel almost on the nets. We have hailed her to haul in, but she took no notice. When we came to examine our nets we found that the trawler had hauled off a piece 9 or 10 fathoms long.

21,611. (*Mr. Lefevre.*) Did you lose it altogether? —Yes, at another time we had another portion of our nets all torn to pieces.

21,612. Could you not take the number of the trawler who did that ?—No, not at night, and you might as soon ask them for anything as their number if you could not see it yourself.

21,613. (*Professor Huxley.*) You are aware that you could have punished them if you could have got their number ?—Yes.

21,614. Did you ever hear of this regulation : " Trawl-boats shall always keep off a distance of " at least three miles from all boats fishing for her- " rings or mackerel with drift-nets ?"—No, I was not aware of that.

21,615. You are not aware that you could appeal to that as the law ?—No.

21,616. If that law were enforced could the trawlers do you any damage ?—It would certainly keep them out of our way at night. They would not come in contact with our nets at night.

21,617. Apart from the injury done by the trawlers getting foul of your nets, do you think that they do you harm by destroying the brood of fish ?—I should think they do.

21,618. Have you any good reason for thinking so ? —They catch a good many hake.

21,619. (*Mr. Lefevre.*) I suppose you mean that they catch fish that you would otherwise catch ?—The quality is not as good when they catch them as when we do.

21,620. (*Professor Huxley.*) You say you have not heard of the regulations which I have read to you ?— No.

21,621. Here is another one : "Whenever herring or " mackerel boats shall commence drift-net fishing in " any place whatever, the trawl-boats which may be " already fishing in such places shall depart there- " from, and shall keep at a distance of at least three " miles from the said drift, herring, or mackerel " boats." I suppose you never heard of that ?—No.

21,622. That compels the trawler to get up his nets and be off ?—Yes.

21,623. If this regulation were enforced would that effect all that you wish with regard to the interference of the trawlers with you ?—It would be of very great benefit to all the drift-net men.

21,624. I think you said that you had no particular mackerel-fishing at Looe ?—No, except shore seining.

21,625. But that is quite a different occupation from pilchard seining ?—Yes.

21,626. You haul the nets on to the shore ?—No, we haul them into the boats the same as we do in the pilchard seining.

21,627. Have you two-oared boats ?—Yes.

21,628. Is your beach rocky ?—Yes, it is a very rocky shore indeed.

21,629. Is there anything with regard to your fishing at Looe upon which you wish to make a remark ?—No, I think not.

21,630. Is there anything that wants remedying ? —I think it would be of great benefit if the drift- boats were allowed to go anywhere to fish. I have known, since I have been drifting at Looe, boats to catch 14,000, 15,000, 16,000, and 20,000 fish, when the boats were but half a mile from the shore, when the seiners would not have been able to catch them. Now if the drift-boats are to be kept two miles off the shore, we should have no fish at all. The seiners could not catch them, and we should not be allowed to catch them.

21,631. (*Mr. Lefevre.*) How many pilchard seiners are there now at Looe ?—Two.

21,632. How many used there to be there ?—There used to be five.

21,633. (*Professor Huxley.*) You spoke of some regulation preventing the drift-men from fishing within two miles of the shore. Have any of them been prosecuted for that ?—Not for a great many years. One of the Looe men was prosecuted for shooting his net within the limits.

21,634. Has there been any prosecution within the last 10 or 15 years ?—No.

21,635. But I presume there have been a great number of cases in which the drift-net men have shot their nets within two miles ?—Yes.

21,636. But none have been prosecuted ? —No, none have been prosecuted, but many have been threatened.

21,637. (*Mr. Lefevre.*) They did not pay any attention to the threats, I suppose ?—No.

21,638. (*Professor Huxley.*) Then you do not know whether they could be enforced now or not ?— No.

21,639. Have you any crab or lobster-fishing at Looe ?—Yes.

21,640. What is the mode of fishing you adopt ? Do you use the ordinary crab-pots ?—Yes.

21,641. Have the fish increased or diminished of late years ?—They have diminished.

21,642. To what do you ascribe the falling off ?—I do not know what the cause of it is.

21,643. Has the take diminished ?—Yes, we cannot get half as much as we used to.

21,644. Do the trawlers at all interfere with the crab-fishing ?—No, the crab-pots are shot in the rocks, and they cannot trawl there.

21,645. Has the lobster-fishing fallen off ?—They have been very scarce this year.

21,646. Have the trawlers anything to do with that ?—I do not know. All I know is that we have not been able to catch many lobsters this year. They have been very scarce indeed.

21,647. You heard what was stated by other wit- nesses respecting the sale of fish to the poor by drift- net men ?—Yes.

21,648. Do you agree that that is the case ?—Yes, I have sold 26,000 on the beach in one day to the country people.

21,649. Did you sell them to the hawkers ?—Yes, and they carried them into the country.

21,650. Do any London dealers come down to buy your fish ?—No, there are certain men who buy fish at Looe to send to the markets, but they do not take the pilchards. The pilchards are sold about the country.

21,651. (*Mr. Lefevre.*) Is there any export of her- rings from Looe ?—No, there is very little round this part of the country.

21,652. Is there any by sea ?—No.

21,653. (*Professor Huxley.*) Is there any regula- tion here as to the size of the crabs caught ?—No.

21,654. Then you can catch any size you like ?— Yes.

21,655. Have you been in the habit of catching any small crabs to any great extent ?—I do not know that I have.

21,656. I suppose you know what a berry lobster is? —Yes.

21,657. Have they been caught here to any great extent ?—Yes.

21,658. Do the fishermen catch them whenever they can ?—Yes.

21,659. (*Mr. Lefevre.*) Do they fetch a better price in the market than the others ?—Yes, they generally put them on the top of the package when they send them to London.

21,660. (*Professor Huxley.*) Do you think that the catching of these berry hens has anything to do with the falling off of the lobsters ?—I have no doubt that if the berry lobsters were thrown away the increase in the quantity would be much greater ; but at times, if they throw away all the berry lobsters, they would have very few for the market.

21,661. Has the crab and lobster fishing increased of late years, that is to say, have the number of people engaged in the fishing for them increased ?—Yes, of late years.

21,662. Then do you think that over-fishing has anything to do with it ?—Perhaps it may have.

21,663. Are your pots of the same construction as they are elsewhere ?—Yes.

21,664. Do you use trunks ?—No.

21,665. You merely use pots then ?—Yes.

21,666. (*Mr. Lefevre.*) Are you yourself the owner of a boat ?—Yes.

21,667. How do you pay your men ?—They are all paid by the share.

21,668. How many shares are there ?—There are nine shares in the pilchard fishery.

21,669-70. How do the shares go ?—Four men get one share each. The boat takes one share, and the nets take four shares.

21,671. Are you yourself the owner of the nets ?—Yes.

21,672. Do they generally belong to the owner of the boat ?—Yes, in our place, but in Mounts Bay they go differently, I believe.

21,673. Are the pilchard boats fitted with the herring nets ?—Yes.

21,674. Do you ever use the pilchard nets for herrings ?—No.

21,675. Do you find that you do not catch the herrings with them ?—Yes.

21,676. Is the mesh too small ?—Yes.

21,677. Then are not the meshes of 36 inches to the yard the proper size for herrings ?—Yes.

21,678. And it would not answer to have a smaller mesh ?—No, the net shrinks by curing.

21,679. What do they shrink to ?—They shrink up to 40. I have known some of them to shrink up to 41.

21,680. Do you think that the simple difference between 36 and 38 meshes to the yard is sufficient to make all the difference ?—Yes, from 38 to 39 and 40 is generally the rule for pilchard fishing.

21,681. Would the nets of 35 and 36 meshes to the yard be too large for the pilchards ?—Yes, we should never catch any pilchards with nets of that description.

21,682. Have you observed any great increase in the number of herrings during the last few years ?—No, we think that the herring is a fish which visits at a certain place for five or six years, and then takes its departure, and goes to another place. At Plymouth, where we now go herring fishing, they have only come in during the last few years, and at Torquay they have all gone.

21,683. Are you aware that there has been a great increase in the herring fishery at Plymouth during the last few years ?—Yes, there has been a very great increase there.

21,684. How long have you been fishing at Looe ?—For the last 12 years.

21,685. Did the herring fishing commence then for the first time ?—Twelve years ago, when first I went to Looe, we used to go to Torquay. I believe that boats from Polperro had been out there before that. Latterly we have only been to Plymouth.

21,686. What is your season for the herrings ?—November and December.

21,687. Was it formerly in only those months of the year ?—Since I have been engaged in the trade the herring fishing has generally been in those months, and sometimes at the end of October.

21,688. Is the pilchard fishing your harvest time ?—Yes.

21,689. That is, you make more money of the pilchards than of anything else ?—Yes, that is our principal fishing.

21,690. Do you find, taking the year round, that you make as much money now as you did 15 years ago ?—Do you mean in the pilchard fishery ?

21,691. I mean in all the fisheries together ?—Some years we do well, and some years we do badly. Fishing is all a speculation. I do not think there has been much difference, taking it altogether.

21,692. Is the price of pilchards less, or about the same ?—It is less.

21,693. Then the price of pilchards has gone down?—Yes.

21,694. How do you account for that ? Are there more pilchards caught off the coast ?—We have a better mode of catching them.

21,695. Are there more caught ?—Yes.

21,696. By the drift-boats ?—Yes, at Looe now we have all cotton nets, and they catch three fish where one was only caught before. We have also larger boats, and we carry longer nets.

21,697. Do you make more money by the pilchards than you did formerly ?—There is sometimes a difference, taking one year with another.

21,698. Taking the average of years, do you make as much ?—I do not think I have ever known the pilchard drift-boats to increase faster than they have done during the last three or four years. At our place drift-boats seem to be coming up every month.

21,699. And the seiners are going down ?—Yes.

21,700. Do you think the seine-net fishing is not found as profitable as it used to be ?—Yes.

21,701. Do you account for that in the same manner as Dr. Couch has done ?—Yes, something in the same way.

21,702. Namely, that the season has altered for seine fishing ?—Somehow or other it appears that they do not catch as many fish in them. As regards the season, we have caught shoals of fish which have come along in the middle of the summer, but they have caught very little of them, not having really first-rate fishermen to direct the work.

21,703. Do you fish for hake ?—No.

21,704. You go to the pilchard and herring fishing ?—Yes, and to the mackerel fishing also.

21,705. Do these three descriptions of fishing take up the whole of your time ?—Yes, at this part of the year we take two months to repair our craft, and some of our boats go spring pilcharding for about two months.

21,706. You take the pilchards then for bait ?—Yes, and for the market when we send them to London.

21,707. We have been told they are very poor fish at that time of the year ? — Yes, they are poor fish then, but still they fetch a price at Plymouth.

21,708. Is any of the bait you speak of for the market ?—Yes, for the market. The Frenchmen come over and buy some of these pilchards for bait.

21,709. Do many Frenchmen come over here to fish with the hook and line ?—They come into the Channel, but not much where we are. They come to Plymouth to buy their spring pilchards for the long-line fishing.

21,710. How many hake-boats are there at Looe ?—Not more than six.

21,711. Has the number fallen off of late years ?—There is very little difference. There are only a few who attend to the hake fishing about this time of the year. It is left to a few old men who are too old for other fishing, so they go a-hakeing. Perhaps in the spring of the year, after we have done with the pilchard fishing, in April or May, some 12 or 15 of our large boats may get out.

21,712. Have you observed whether the hook-and-line fishing is not as profitable as it used to be ?—As regards the large boats they never used to go out hakeing until the last few years.

21,713. Formerly the hake fishing was carried on close in-shore in open boats ?—Yes, we do not carry on hake-fishing at Looe as they do at Polperro.

POLPRERO.

R. Little.

28 Mar. 1864.

21,714. Of late years have the hake-boats not got as much as they did formerly?—They cannot catch anything like it.

21,715. To what do you attribute that?—We think it is because the fish are not there. I cannot exactly state what is the cause.

21,716. Have you observed any great increase of trawlers off your shore?—Yes.

21,717. Do they catch the fish you formerly caught?—I have no idea. They destroy a great deal of spawn.

21,718. Have you yourself seen spawn taken up by the trawlers?—I was never on board a trawler. I have seen them heave it overboard with the shovels for a long time.

21,719. What have they thrown overboard?—The stuff they have taken out of the sea.

21,720. Have you observed whether that was spawn or not?—No.

The witness withdrew.

E. Pengelly.

EDWARD PENGELLY called and examined.

21,721. (*Professor Huxley.*) Are you a fisherman at Looe?—Yes.

21,722. Did you hear the evidence of the last witness?—Yes.

21,723. Do you agree with it generally?—Yes, I agree generally with what he proposed.

21,724. And you concur in the statements which he has made to us?—Yes. I think the statements he has made are very good statements.

21,725. Is there anything that you wish to add?—I do not see that there is anything I could say different from what he has stated already. I agree altogether in the remarks which he has made.

21,726. Do you ever experience any difficulty in getting bait at Looe?—I do not require any. I have not been in the habit of going out hooking now for some years past. Some of our men go hooking in the season, and they have to provide themselves with bait, but that is a line of fishing which I do not follow.

21,727. Have you ever heard any complaints on the part of the fishermen who do follow it as to a difficulty in obtaining bait?—No, I never heard any complaint.

21,728. Is there any dredging for oysters carried on about your place?—No, there is no oyster-dredging nearer than Falmouth.

21,729. Is there anything that occurs to you which you would like to add to the evidence of the last witness?—I do not think there is anything more that I need say. Perhaps I may be allowed to say that I have often been alongside the trawlers when they have been fishing, and I have noticed the way in which they fish.

21,730. What have you seen them do?—I have seen them take up the trawl, and after sorting out the good fish they have shaken the net out and thrown the small fish overboard.

21,731. Did you observe what there was in the trawl?—Yes; there were a good many small fish and a considerable quantity of spawn. It would be no service either to them or us to carry in such fish to the market. I have also been engaged in drifting for the last 30 or 40 years, and I have known cases occur frequently in which the trawlers have cut our nets away in the night time. I have lost a good deal of nets at different times in consequence of the trawlers fishing by night and trawling over them.

21,732. Do you carry lights on your drift-boats?—Yes.

21,733. Are the lights you carry like those described by the previous witness?—Yes, just the same.

21,734. You do not carry one light above the other as you are directed by the regulation laid down in the Act of Parliament?—No, we could not do that very conveniently.

21,735. Why could you not do it?—We are generally rolling about so much that we could hardly manage two lights.

21,736. Then you think that the regulation which requires you to hoist on one of your masts two lights, one three feet over the other, would be if enforced an inconvenient regulation?—Yes, I do most decidedly; for when we are engaged in the drift-boat fishing we could hardly keep two such lights at the masthead.

21,737. You say that the trawlers do injury to your nets in the night time?—Yes.

21,738. Do you think it quite impossible to identify the trawlers who do the damage?—All I know is that they do us a great deal of damage.

21,739. Cannot you get hold of them?—No, and yet they do us a great deal of injury.

21,740. Is it not to their own interest to keep out of your way?—There is ground further out where they could go and trawl, but they like to come in nearer to us, as they frequently get bait.

21,741. (*Mr. Lefevre.*) Do they sell you the bait?—No, they steal it from our nets.

21,742. They steal it?—Yes, and they know that we have no small boat with us, and that therefore we cannot get up to ascertain their name or number.

21,743. What have you lost in that way?—I have lost many pieces of my nets in consequence of their trawling at night.

21,744. Were they of any great value?—Yes, at times I have lost portions of net worth several pounds.

21,745. (*Professor Huxley.*) You have never been able to get the number of the boat which committed the injury?—No, we cannot get at them, and they know that very well. If there is any chance of our getting up close to them they will drop a piece of tarpauling over their number.

21,746. What distance from the shore are they trawling at the time of which you speak?—Perhaps they may be six or seven miles from the land; sometimes more and sometimes less. Sometimes a shoal of fish will come in to within half a mile of the shore, and at other times they will be six or seven miles out at sea.

21,747. What is the character of the shore off Looe; is it rocky or sandy?—It is rocky except in Whitesand Bay.

21,748. You have sandy ground in Whitesand Bay?—Yes, it is a clean sandy bay for a few miles.

21,749. Is there any seining carried on at Wrinkle?—No; there are no seines at Wrinkle. In point of fact seining has almost come to nothing along our shore.

21,750. (*Mr. Lefevre.*) Do you agree with the last witness that any regulation that would interfere with the pilchard drift-net fishing would be injurious?—Yes, I believe that any interference with the drift-nets would do a great deal of harm. The Cornish coast would be worth nothing to the fishermen if the drift-net fishing was interfered with. The fishermen have now got the nearest scale they can use for catching good fish, and they catch none that are not fit for the market.

21,751. How long have you been engaged in fishing?—I have now been drift-net fishing for the last 39 years.

21,752. Are you the owner of a boat?—Yes.

21,753. Have you more than one?—Yes.

21,754. How many?—I have three.

21,755. Do you find, on the whole, that you make less for your fishing now than you did in former years?—Sometimes the fish fetches the price it did 18 or 20 years ago, and then when we get very large catches the price becomes lowered again.

21,756. You do not find, however, that the value of your fishing has diminished very greatly of late years?—No, there is not much difference that I see.

The witness withdrew.

WILLIAM LAUGHRIN called and examined.

21,757. (*Professor Huxley.*) Are you a native of this place?—No, I am not a native, but I have been here some time.

21,758. How long have you known it?—For about 25 years.

21,759. You have heard what has been stated by Dr. Couch and the other witnesses?—Yes.

21,760. Do you agree generally with the opinions which they have expressed?—There are several things upon which I wish to make a remark. Perhaps I had better take the trawling first.

21,761. Then let us begin with the trawling. What have you to say in reference to that?—The fish off here have got scarce for many years past, and I put it down to the trawling.

21,762. Do you think that the operation of trawling destroys the spawn in the way in which it has been described?—I believe that the trawlers destroy the food of the fish. I consider the bottom of the sea as a sort of forest, full of crustacea of different sorts which supply food for the fish. There are two sorts of crustacea, one the stalk-eyed and the other the sessile-eyed, and they are to be found among the coralline sponges. The fish have been in the habit of coming in to the shore to feed upon these beds, which were almost like a forest of well-cultivated ground. The trawlers, however, have almost entirely destroyed these grounds, and as the fish can no longer find food when they come in they have ceased to frequent the shore. Perhaps I may be allowed to draw your attention for a moment to another matter. We have all along the coast what are known as marks. How is it called a mark? Why should it be called a mark? Because it is a series of rocks where the coralline sponges have been well cultivated, and as a consequence these crustacea abound among them.

21,763. What do you mean by "a mark"? Do you mean a fishing mark?—Yes, a fishing mark with plain ground probably about 30 fathoms from it. The grounds all round have now been cleaned, and there are no fish to be found upon them, but the trawlers cannot come near the marks.

21,764. You attribute the destruction of the grounds near the marks to the trawlers?—Yes, the trawlers have come in, and they have swept them quite clean. Our boats can now come to an anchor on those places, and they are frequently able to catch five or six cwt. a boat, but they would not be able to do that if the ground was not of such a nature as to prevent the trawlers from going close in.

21,765. Do you mean that that is a piece of ground which the trawlers cannot sweep?—Yes.

21,766. Where are there such places?—Just off to the westward of our land. To the south-west of this place there are different rocks where our boats go and where they can always find fish.

21,767. There are particular places where your fishermen can go and always catch fish?—Yes.

21,768. Where all around they cannot catch fish?—Yes; on these marks they always find fish, while on the plain ground within a short distance of it they may catch a straggling fish or so, as they are always ranging round for food, but nothing more; they may catch a fish or two, but nothing to pay them. They live on the crustacea, which supply food for the fish and are likewise the scavengers of the sea.

21,769. Before the trawlers commenced their operations off this coast, were you able to get fish in the intervals between these marks?—I believe so.

21,770. Do you know that as a fact within your own knowledge?—Yes; I have examined the coral lines brought in by our boat's men. Here is a representation of a nest of them; I have sent off some to scientific men.

21,771. A nest of what?—Of the sessile-eyed crustacea.

21,772. Is that Mr. Spence Bates' book?—Yes.

21,773. You are of opinion that the trawlers in sweeping up the corallines have swept away the food of the fish?—Yes, it destroys the food of the fish.

21,774. The fish have not been able to find food there since the trawlers came?—No; I have examined the stomachs of the fish, from the mackerel down to the herring; I have examined those of the cod, haddock, ling, and conger; I cannot find crustacea in the conger. I have here a list of the crustacea which have been found in the stomachs of different fish.

21,775. The cod takes what it can?—Yes, it will eat other fish, but it prefers crustacea to any other kind of food.

21,776. The cod-fish will eat a great number of herrings, will they not?—Yes.

21,777. They are found abundantly in the stomachs of the cod?—Yes.

21,778. You think that the trawlers by destroying the ground where the crustacea flock destroy the food and prevent the fish from going there?—Yes, they scrape the bottom of the sea day after day. Sometimes there will be as many as 40 or 50 sail of trawlers sweeping the ground at once, and they scrape it as clean as that table; they allow no time for it to become replenished.

21,779. (*Mr. Lefevre.*) Do you not think that the first persons to observe the decrease in the fish would be the trawlers themselves?—They would not say anything about it.

21,780. (*Professor Huxley.*) Why do they go over the same ground week after week if there are no fish to catch?—They get the straggling fish.

21,781. But we have had it in evidence that a whole fleet of trawlers has been trawling over the same ground for weeks, and they have caught the same quantity of fish at the end of that time as they did at the beginning?—No doubt the fish are constantly ranging all over the ground for food.

21,782. (*Mr. Lefevre.*) But if they did not find food they would cease to frequent the place?—No; they keep ranging about. I can give you an instance that occurred within my own knowledge. I had an idea that it would be better to use gut instead of twine, but I lost my hook altogether, and yet a man who lives here caught a fish with my hook in it; when he got the fish there was my gut, he knew it was mine; that will show you how the fish range about. They are constantly ranging about after food.

21,783. (*Professor Huxley.*) If, as you suppose, the operations of the trawlers have so completely destroyed the food of the fish that they do not now come here, it would surely be impossible for the trawlers to go on for six or eight weeks catching fish on one and the same ground. Whatever may be the motives of the fish they must go there or the trawlers would not be able to catch them?—Certainly they do; but if you kept the trawlers from coming within the bays you would have some reserve where fish would always be plentiful.

21,784. (*Mr. Lefevre.*) How do you account for the increase in the number of the trawlers if the fish have ceased to visit the coast?—I believe that trawling has been found to be a very profitable occupation.

21,785. That must have arisen from the quantity of fish they are able to catch?—They catch that description of fish which always brings the best price, such as turbot, brill, and soles.

21,786. (*Professor Huxley.*) Do any of your fishermen here catch turbot with the hook and line?—Sometimes they will bring in seven or eight turbots.

21,787. I believe that you have been a good deal accustomed to hooking?—Yes.

21,788. Do you ever catch soles with the hook?—Never.

21,789. Then it would be altogether impossible to supply the market with soles by hooking?—Yes, it could not be done by the hook and line.

POLPERRO.

W. Laughrin.

28 Mar. 1864.

21,790. Do not the soles form a large proportion of the fish the trawlers catch ?—Yes, and plaice.

21,791. Have you ever been on board a trawler ?—Yes.

21,792. Have you seen the quantity of fish they bring up ?—I was never on board a trawler when the trawl was taken up.

21,793. You know that they do catch large quantities of fish ?—Yes.

21,794. Do you think it would be possible to send the same quantity of fish into the market if trawling were put a stop to ?—Perhaps not.

21,795. And they catch you say the best description of fish ?—Yes.

21,796. Do they not supply the market with the greatest quantity of good eatable fish ?—No ; I think the hookers beat them in good eatable fish.

21,797. Do they exceed them in quantity ?—In the quantity of good eatable fish I am sure they would. They catch much better fish—much better than are caught by the trawl.

21,798. But I am speaking of the quantity required to supply the London market ; you are aware that that is exceedingly great ?—Yes ; some people follow the trawling, and some people take to fishing with the hook and line. The quantity of fish caught for the supply of the London market would depend in a great measure, if there was no trawling, upon the number of hookers that would go to sea ; there are not enough hookers now to compete with the trawlers. Perhaps there may be 60 out of Plymouth, and I believe that some of them have failed in that business ; they are hurting themselves to some extent.

21,799. Then it is clearly your opinion that trawling very much injures the hook-and-line fishing ?—Yes, I believe it does.

21,800. Do you think that the injury to the hook-and-line fishing is so great that trawling ought to be put a stop to ?—No.

21,801. Then what would you do with it ?—I think the trawlers ought to be kept a certain distance from the land ; they ought not to be allowed to come into the bays.

21,801*a*. Why should they not be allowed to come into the bays ? Do you think that they destroy the young fish there ?—Yes ; very small fish come into the bays. I have myself seen turbot caught in the harbour no larger than a half-crown piece or a shilling.

21,802. How close do the trawlers come into the bays here ?—They get into the bays in the night time, and get out again in the morning.

21,803. Do they get so much fish in the bays that it is a matter of interest to them to go there ?—Yes. For instance, they go into Whitesand Bay, on the other side of Looe, and I believe that they catch a great quantity of small fish there.

21,804. Do you think that they would do any harm if they were kept well outside ?—No, I do not think they would do much damage in that case.

21,805. What distance would you keep them outside ?—They ought to be kept from every headland.

21,806. How far would you keep them off the headlands ?—I would require them to keep out two or three miles beyond every headland. I think that that would give fair play to all.

21,807. You heard the passages I read just now from the articles of the Convention ?—Yes.

21,808. You are in the Coastguard, I believe ?—Yes.

21,809. Did you ever know an instance in which any of these regulations were enforced ?—I never knew of their being enforced with regard to the trawlers.

21,810. Have they ever been enforced in any other respect ?—Yes, I think they have.

21,811. Will you state in what way they were enforced ?—When we had a cruiser here some time ago I remember that one of the drift boats was seized and brought into Polperro. I believe that the nets were seized and put into the watch-house.

21,812. What were they seized for ?—I believe it was for being too close in-shore.

21,813. Were the persons who had committed the offence brought before the magistrates ?—Yes, I believe they were.

21,814. Were they fined ?—I forget whether they were fined or not, but I know that their nets were taken in the first instance.

21,815. How long ago is that ?—I think it must be about 20 years ago now.

21,816. Is it your impression that there was a conviction ?—No, I do not think there was a conviction, and I believe they got their nets again. It will be more than 20 years ago now, and I do not distinctly remember the whole of the circumstances.

21,817. You do not recollect whether or not a conviction took place ?—No, I do not, but I rather think that there was not a conviction.

21,818. Is there any other point on which you wish to say anything ?—No, I think not.

21,819. Do you agree generally with the rest of the evidence which has been given ?—Yes.

21,820. Do you think that any interference with the drift-net fishing by any sort of regulation would be likely to be injurious ?—I think if they were prevented from going where they go now to fish it would be very injurious to them.

21,821. Then you think it would be better not to meddle with them ?—Yes. Our coast here is a very bold coast, and altogether unsuited in most places for pilchard seining. They could not shoot their seines round our rocks.

21,822. They cannot go where the drift-net boats can ?—Just so. If there are any fish in-shore the drift-boats can go close up to the rocks, and shoot the nets when the seiners would find it impossible to shoot their seines.

21,823. When you had seine-nets where were they shot ?—We used them down the bays about here, about four or five miles off. Ours is too bold a coast generally for seining. A seine could not be shot, although the drift men can shoot their nets easily. If there were 10 shoals of fish in here a seine could not shoot, and the fish would all escape. No seine could take them.

21,824. But the drift-nets could ?—Yes.

21,825. Do you agree with what has already been stated as to the value to the poor of Cornwall of the pilchard fishery ?—Yes, the pilchard is a most valuable fish to the poorer classes here. I believe that the rich also are very fond of them. We often send them away to different parts. I have even known them sent to Australia.

21,826. (*Mr. Lefevre.*) Is there any export of pilchards from this place ?—No ; we do not cure any quantity for exportation.

21,827. Do the boats take any great proportion of the pilchards they catch to Plymouth ?—Yes, when they have a large shoal here they send them to Plymouth. They get a better market for them there. The boats are sometimes taken into Fowey, a few miles from here, by Mr. Fox's cutter.

The witness withdrew.

R. Hicks.

ROBERT HICKS called and examined.

21,828. (*Professor Huxley.*) Are you a fisherman here ?—Yes.

21,829. Have you been for many years a fisherman here ?—Yes.

21,830. Have you practised fishing with drift-nets and with the hook-and-line as well ?—Yes, and seining as well.

21,831. When you practised seining whereabouts did you shoot your seine ?—Up at Shalborough and Bigbury Bay. I have used the pilchard seine there.

POLPERRO.

R. Hicks.

28 Mar. 1864.

21,832. In speaking of seining you mean pilchard as well as mackerel seining?—The pilchard seine I mean is what they use in-shore in the bays. The boats do not go out to shoot them.

21,833. Why have you left off pilchard seining, and taken to drifting for pilchards?—My parents and my grandfather before them had a part share in a seine, and many a time when they have used it they have caught small fish which they were obliged to cart away for manure. The mesh of the seine is very small indeed, and it will catch anything. It will even catch a shrimp. We drew it ashore, and the fish in it was so small that people would not buy it.

21,834. You found it unprofitable then to continue seining?—Yes; the fish were so very small that we could not get enough for it to pay the wages of the men employed in catching it. It was only used for about six or ten weeks, and then the crew were all paid off, with the exception of my father and myself. My father acted as master of the seine, and we were perhaps occupied for 40 days longer in the months of October and November. That is what we call the after part of the first part of the seining. I have been out catching great quantities of fish at times, and bringing it to the shore, but for all that it was of very little value as it was so small. We found that seining would not do, and the consequence was that the seine went down.

21,835. You found that it did not pay?—Yes.

21,836. You could not catch enough fish?—Not enough good fish to make it pay.

21,837. Even when you used it late in the season?—No.

21,838. Then in your case it was not merely that the time for the coming of the fish had changed, but when they did come you could not catch a sufficient quantity to make it a profitable business?—Yes.

21,839. Have you anything to add to the evidence of the witnesses who have already been heard?—No, I think not, unless it is with regard to trawling.

21,840. What have you to say in regard to trawling?—I think that trawling by night injures us a great deal sometimes.

21,841. Have you yourself ever been injured in consequence of the trawlers trawling by night?—Upon one occasion I lost a great deal of net. It was cut away, and it was picked up by some other vessels.

21,842. Where did that occur?—It was off here. The boat was a Mounts Bay boat.

21,843. Did you ascertain who it was that had done the damage?—No, I could not get a wind strong enough to enable me to go after him and find out his number. I believe that he hove his foresail over the number so that we should not detect him. We could not see the letters on the stern nor his number. We were obliged to cut away the nets. There was a rope attached to the bottom of the net to save it, but we had to cut six nets away.

21,844. The boat was a Mounts Bay boat?—Yes, but it put that night into Plymouth. I was very much afraid of the consequences when it occurred. I thought I should be ruined, and indeed I should have been very much injured if I had lost my nets. The next day, however, I fortunately got them again. They had been picked up.

21,845. Have you sustained any injury on any other occasion?—Yes, but not to the same extent. Several times the trawlers have trawled across my nets and cut them away.

21,846. Do you think there is no remedy short of putting down trawling by night?—I do not know.

21,847. Is it absolutely impossible to provide any means by which you might be enabled to identify the persons who commit the damage?—All I know is that they interfere very much with our pilchard-fishing and also with our mackerel-fishing.

21,848. Do they injure you in any other way than damaging your nets?—Yes.

21,849. In what way do they interfere with you?—We cannot shoot our nets in less time than two and a half hours, and sometimes it will take us five or six. Sometimes directly we have got our nets out a number of trawlers will shoot their trawls and come down right among a fleet of boats.

21,850. You know that that is illegal?—Yes, but they do it constantly, and when we find they are among us, every one of us has to haul in his nets as fast as he can in order to get clear of the trawlers. We think that a very great hardship. We are compelled, if nothing worse happens to us, to lose our fishing.

21,851. Do you think that no kind of regulation would be sufficient to protect you short of putting down trawling by night altogether?—I think that trawling in the night time should be put a stop to. I do not think that trawling altogether should be prevented, but something should be done to prevent them from interfering with us when we have our drift nets out. They pay no attention to us at all, and in the night time they do not care where they trawl. We have sometimes actually seen them go over the nets, and if we were near enough to hail them they would swear that they had never seen us, and that they had not touched the nets at all. Yet when we have hauled the nets in we have found them all torn, and the fish that were in them gone.

21,852. You have heard that the Convention says that trawl-boats shall always keep at a distance of at least three miles from all boats fishing for herring or mackerel with drift-nets?—Three miles from any boat! I am afraid that they call it a long three miles or a short three miles as they like to have it. Sometimes some of them will be three miles off, and there will be others that will hardly be three fathoms off.

21,853. Is there anything else connected with your interests as a fisherman upon which you wish to make a remark?—I have nothing to say further than what other people have said. As to the lights we carry when we are out drifting, we have a large lantern such as Mr. Riley mentioned. It is fixed upon a stand. We keep it up when we are shooting. If we have calm weather we may keep it below, but generally it is up while we get our nets up.

21,854. How high is it up?—I think about six feet, but as soon as we see any sail or steamboat, or anything of that sort coming, we light up a large flare-up with a big bunch to it. That gives a very good light. I have hauled it up, and have been able to see a vessel with all her crew for a considerable distance, perhaps a quarter of a mile. The flame will light up all round for that extent. It gives more light than four lights in lanterns.

21,855. Do you think it is impossible to comply with the Convention?—I don't know.

21,856. The Convention says that the masters of drift-net boats shall hoist on one of their masts two lights, one over the other, three feet apart?—Yes.

21,857. You do not comply with that?—No.

21,858. Do you think it is impossible to have two lights hoisted one above the other?—I do not see how we could have any but the one we generally use, unless it is the flare-up.

Captain BRINE recalled.

Capt. Brine.

21,859. Are you of opinion, Captain Brine, that the two lights required by the Act of Parliament to be hoisted could be kept up one over the other?—Yes, they might be kept up easily.

21,860. I confess that I do not see any difficulty myself. It does not strike you that there would be any difficulty?—Certainly not; but in the night time, if they have them, they are scarcely ever known to use them. I believe they refrain from doing so solely for the sake of economy. They would be put to a greater expense; but it is my opinion that if they showed the lights which they are bound to show, if

POLPERRO.

Capt. Brine.

28 Mar. 1864.

they comply with the Act of Parliament, there would not be one-half of the accidents which occur now.

21,861. (*Mr. Lefevre.*) Do you think that in consequence of their not complying with the Act there is nothing to warn the trawlers where these drift-boats are?—No doubt there are instances in which the trawlers might get out the way if they wished to do so, but I have known other cases in which it would be very difficult to see the drift-boats. In fact the trawlers do not see the lights until they are almost down upon them, and I believe the neglect is chiefly committed on the part of the drift men for the sake of economy. Of what real use can a little lamp and a dirty bit of candle be? and they too for half of their time are at the bottom of the boat.

21,862. Then I presume you are not surprised that they do occasionally lose their nets?—Not at all. The only wonder to me is that they are not frequently run down.

R. Hicks.

ROBERT HICKS (examination continued).

21,863. (*Professor Huxley.*) Do you keep your mast up when you are fishing?—No.

21,864. That makes the boat ride easy?—Yes.

21,865. Do you hoist the light you use upon a stand-up?—Yes, we have a large stand made on purpose, and all the east country men do the same. The lantern goes into it, and is fixed up on a large rod of iron.

21,866. How high will it be up above the level of the boat?—About eight feet.

21,867. Why could you not have a second light three feet below the first on the same stand-up?—I don't know why we could not have one, but it would be necessary that we should have a different kind of thing made on which to place the lights. I don't think that a second light in that position would show as much light to be seen as far off as the flare-up we now use.

(*Captain Brine.*) Perhaps you will allow me to remark that the flare-up is never used by fishermen except when a vessel is almost right upon them.

21,868. (*Professor Huxley to witness.*) The law is quite explicit on the point that there should be two lights. What I wish to get at is whether there is any practical difficulty in the way of carrying these two lights. I can't see why, if you are required to have a stand-up at all, you should not have one that would carry a second light three feet above the first?—We could not do that now.

21,869. I understand you to say that you have a light eight feet up?—Yes.

21,870. Then why is it not possible to put one three feet below that, as the law requires?—I don't know; there is no room on the stand-up to put a second light.

21,871. There is no room to hang a lantern three feet under the first?—No, the stand-up we have now would not enable us to do that. The light would not be secure.

21,872. Do you mean to say that the lantern is not more than three feet above the level of the gunwale?—Yes, it may be four or five feet above that.

21,873. I suppose it would not do to keep your mast standing up, it would make your boat work uneasily?—Yes, we should not be enabled to get in our nets, we should have to carry more hands, and that would not pay.

21,874. When you have struck your sail, does the boat work a good deal?—Yes.

21,875. Then you don't think you could follow out this regulation completely?—No, I don't think we could.

21,876. Because you see that this article of the Convention says that you are to hoist two lights on the mast, one three feet over the other?—Yes.

21,877. You think you could not do that?—No.

21,878. You can't do that because you don't keep the mast up?—No.

21,879. Would there be any difficulty in having an upright on which you could carry two lanterns, one three feet higher than the other?—I don't know where we should fix it. Ours is a very small boat, you must remember. It is not like a decked vessel.

21,880. (*Mr. Lefevre.*) Are you part owner of a pilchard seine-net?—My grandfather was at Bigbury Bay.

21,881. Did you yourself work for wages?—Yes.

21,882. What wages did you get?—From 8*s.* to 10*s.* a week; the master seiner would get a guinea.

21,883. How many men would there be employed in managing one seine?—Eighteen. Occasionally we may have an extra hand or two; probably we should employ two or three additional hands if the fish were plentiful.

21,884. Can you tell how many nets are used at this place now?—There are no pilchard seine-nets here now.

21,885. How many were there here formerly?—I believe that at one time there were three seine-nets.

21,886. (*Professor Huxley.*) How are your boats rigged?—They are lugger rigged.

21,887. That is you have two masts?—Yes.

21,888. A mizen?—Yes.

21,889. Do you unship your mizen at night?—No, we keep the mizen up.

21,890. Then if you can keep up that why not hoist your lights on the mizen?—It would be impossible for the lights to be seen if we did. The sail is continually flopping about the deck, and the boat is generally head to wind.

21,891. But if the boat was head to wind would it not be possible to see a second light round three quarters of the compass?—I don't see how you could fasten it up; it would be almost certain to be knocked down by the sail. I broke three glasses in my lantern the week before last. We are continually breaking lanterns, and of course if we had it fixed up higher there would be more waggling about.

(*Capt. Brine.*) They could hang up the lantern easily enough if they liked. There is no excuse for them not having a second light. All that they would have to do would be to run out from the mizen mast an iron stem with a little block. They could fix the lantern on that, and then it would hang up without any trouble.

(*Witness.*) I have seen the boat roll so that I have been obliged to hold on by the gunwale.

21,892. (*Professor Huxley.*) Have you anything else to add to what you have already stated?—No.

21,893. (*Mr. Lefevre.*) What is the furthest distance that you go out in your boats for pilchards?—Sometimes we go out for 15 or 20 miles. We have gone as far as 40 miles.

21,894. As the season goes on do you go further off the shore?—Yes.

21,895. Do you catch a large portion of your fish 20 miles off the coast?—Sometimes I have been catching 10,000 or 15,000 in a night four or five leagues off the shore.

The witness withdrew.

T. Holten.

THOMAS HOLTEN called and examined.

21,896. (*Professor Huxley.*) You have heard the evidence given by the previous witnesses?—Yes.

21,897. Is there anything you wish to add to their statements, or anything you desire to correct?—No; I can only confirm the accounts which have previously been given, especially with reference to the lights. I do think it would be a most inconvenient matter to require us to carry two lights in our small boats where we have so much motion.

21,898. You know that one light is to be above the other; that is what the law requires, and that would take no more room than having one light?—It is not

on account of the want of room that I object so much as on the want of security for the light itself.

21,899. But surely the second light would require less securing than the other one?—We cannot carry the stand up sufficiently high to enable us to have another light placed under it.

21,900. (*Mr. Lefevre.*) Has expense anything to do with the objection?—Of course a little expense would be incurred, but that would be a trifling consideration. My own opinion is that vessels out at sea that could not see one light would not be able to see two. Our lights I may tell you are very beautiful lights; they are large glass lanterns.

21,901. I presume that the intention of the legislature in saying that you shall have two lights was to enable persons approaching you in other vessels to know what the nature of the fishing you were carrying on was?—Perhaps so.

21,902. (*Professor Huxley.*) A trawler would have no hesitation in coming within hail of an ordinary vessel lying at anchor; but the object of the regulation laid down by Act of Parliament is, as Mr. Lefevre says, to enable other vessels to detect the drift-net boat, and thus ascertain the fact that drift-net fishing is being carried on?—Yes.

21,903. Is it for the interest of other vessels to get where you are sometimes?—No vessels ever bring up at anchor where we are.

(*Capt. Brine.*) Will you allow me to say that as by Act of Parliament these men are required to have two lights, if a trawler runs into a vessel he says he is not responsible so long as they have only one light up. His answer to any claim for damage committed by him is, "How was I to know that it was a drift "boat when it did not carry its proper lights?"

21,904. (*Mr. Lefevre to Capt. Brine.*) You think they have no right to complain of the trawlers if they don't take the precautions which the Act itself suggests?—Of course not.

(*Capt. Riley.*) What the fishermen mean to say is that they are placed in a very unpleasant position by the regulation contained in that Act. I believe it is their wish to convey to you that if the Board of Trade established any particular description of one light, the whole of the drift boats would feel themselves bound to carry it out.

21,905. (*Professor Huxley to Capt. Riley.*) The law does make a distinction already, but yet the fishermen don't obey it?—I must confess for my own part I don't see how they can obey that Act so long as they are fishing in this description of boat.

Examination resumed.

21,906. (*Mr. Lefevre.*) Can you suggest any light that would distinguish the drift-net boats from other boats?—I don't know that I can. The light we carry at present is a bright light.

21,907. (*Professor Huxley.*) Is there any other point upon which you wish to make any comment?—I only wish to confirm the evidence that has been already given, that the trawlers materially interfere with our mackerel fishery, which is a night fishery, and also with the pilchard fishery.

21,908. They interfere with both in the same way?—Yes.

21,909. By getting foul of your nets and catching them?—Yes.

21,910. (*Mr. Lefevre.*) Have you ever lost nets in that way?—Yes, I have lost part of my nets on several occasions.

21,911. Have you ever lost any of any great value?—Perhaps on the whole I may have lost 4*l.* or 5*l.* worth.

21,912. Within how many years have you sustained that loss?—It is now little more than 12 months since I had a really good net ruined.

21,913. How did that occur?—I was out fishing in a dark night when a trawler came down upon us. We had up our lights and he had none. He got foul of our nets, and he must have been there some time before we found him out. As soon as we did see him we began to haul our nets, and to get clear of him the best way we could, but we could not do so without doing considerable damage to our gear.

21,914. Was that a mackerel net?—No, it was a pilchard net. On one occasion a trawler came across us several years ago, and completely ruined five or six of our nets.

21,915. What is the length of your mackerel nets?—They will reach about a mile and ahalf in length.

21,916. Are they longer than the pilchard nets?—Yes, they are about three times the length of the pilchard nets, perhaps even more than that. They are a shallower and lighter description of net than the pilchard net, and hence they are enabled to reach further.

The witness withdrew.

JOHN PUCKEY called and examined.

J. Puckey.

21,917. (*Professor Huxley.*) You are engaged in lobster-fishing, I believe?—Yes.

21,918. And in the crab-fishing as well?—Yes.

21,919. You are engaged more in that description of fishing than in anything else?—Yes.

21,920. How long have you been engaged in it?—For ten years and more.

21,921. Have you noticed any diminution in the supply of crabs and lobsters?—I think that the trawlers injure our fishing a good deal.

21,922. What I want to know in the first place is whether there has been any diminution in the amount of fish you can catch?—I think the trawlers destroy the spawn.

21,923. We want to know in the first place whether you can catch less fish now than you did in former years?—Yes, we catch a good deal less fish.

21,924. For how many years has that been going on?—We have been catching less for the last 15 or 16 years.

21,925. Have you been catching less and less year by year?—Yes.

21,926. Has the number of crab catchers increased very largely?—Not here, but I believe in other places it has.

21,927. How is it with regard to the lobster catchers; are more persons engaged in that way than when you began?—I don't know that there is here.

21,928. Do you think that the fishing is carried on more throughout the year than it was in former years?—Yes; some go almost throughout the whole year in other parts, but not here.

21,929. Do they catch crabs of all sizes?—Yes, but none of them are big. There are none big now, or at any rate only a very few.

21,930. Do they catch lobsters in the same way, namely all they can get, great or small?—Yes.

21,931. Then do you not think that their fishing may have had something to do with that diminution in the supply?—I do not know that.

21,932. Then what do you think is the cause of the falling off?—I think it is owing in a great measure to the trawling off our place. The trawlers destroy the breeding places to which the crabs and lobsters resort. They breed generally on the sandy ground, but trawlers come in trawling over that and destroy the spawn.

21,933. I think that you find lobsters mainly on the rocky ground?—Yes, I think we do.

POLPERRO.

J. Puckey.

28 Mar. 1864.

21,934. Then what makes you believe that they go on the sandy ground to spawn?—I know they do.

21,935. Do trawlers catch lobsters in their trawls?—Yes.

21,936. Have you seen them catch lobsters?—Yes, they catch crawfish and all kinds of shell fish.

21,937. Have you seen lobsters caught in the trawls?—I have never actually seen the trawl heaved up.

21,938. How are lobsters sent to the market; are they sent from here to the railway?—Yes.

21,939. All of them?—Mostly all of them.

21,940. (*Professor Huxley.*) It is impossible that they should catch lobster or crab spawn unless they catch the she fish?—They do catch the she fish; we only get one or two in a season; they catch she crabs with spawn in them; they catch hundreds I believe.

21,941. Do you not catch lobsters when they are berry-hens to a great extent?—Yes.

21,942. Then are you not doing the same thing as the trawlers?—Yes, we destroy them no doubt the same as they do.

21,943. (*Mr. Lefevre.*) Has the whole quantity of lobsters sent to market from this place fallen off of late years?—Yes.

21,944. (*Professor Huxley.*) Are you engaged in any other kinds of fishing?—Yes.

21,945. Do you agree generally with what the other witnesses have stated?—Yes.

The witness withdrew.

C. Jolliffe.

CHARLES JOLLIFFE called and examined.

21,946. (*Professor Huxley.*) You are a fisherman here, I believe?—Yes.

21,947. Have you long been engaged in the fishing business?—I have not been fishing very much; I generally buy the fish.

21,948. Have you noticed any difference in the prices within the last 20 years?—Yes, there has been a great deal of difference.

21,949. Do you pay more or less for the fish now?—I don't pay half as much.

21,950. (*Mr. Lefevre.*) Are you speaking now with regard to pilchards?—Not of them in particular, but of all sorts of fish.

21,951. (*Professor Huxley.*) Do you mean that you don't pay as much per pound or per bushel?—What I mean is that I don't buy half as much in proportion as I used to do.

21,952. But what is the price; I wish to know if that is more or less now than in former years?—With regard to the price I think it is somewhat higher.

21,953. Owing to scarcity?—Yes.

21,954. You confirm what has been stated already, that the fish here have been growing scarcer?—Yes.

21,955. To what do you attribute that?—I think it is owing to the trawlers. At Plymouth I have sometimes seen as many as 200 turbots on one stall, which had been caught in Whitesand Bay, and for the largest of them the woman who had charge of the stall only asked 6*d*. I leave you to judge from that what the size of them was.

21,956. (*Mr. Lefevre.*) I believe that the hook-and-line men never catch many turbot?—They will sometimes catch one or two. With regard to the herrings, I don't think since Michaelmas up to the present time there has been three cwt. caught, and I have seen not long after Christmas more than that quantity caught by one boat in the course of a morning's fishing. The reason of that is that our ground has been dragged away by the trawlers. There is nothing to be found on it to keep the fish. Now I believe that in all the bays, wherever there is a sandy bottom, all sorts of fish come to it to spawn. My opinion is that the fish cast their spawn in the sand.

21,957. (*Professor Huxley.*) Do you think that keeping the trawlers out of the bays would be sufficient to prevent that mischief?—Yes.

21,958. Then you don't wish to put a stop to trawling altogether?—No; but I should like to see a stop put to this catching of small fish. I can assure you they frequently catch tens of thousands of little doreys no bigger than my thumb. I have known them to catch 9 or 10 upon a hook-and-line, capital fish for the table; but it is very rare to see that done now.

21,959. Are you aware that the trawlers catch a larger quantity of fish now than they did in former years?—Yes; if any person would go to Plymouth market he will see thousands of fish caught in a week not fit for food at all. In point of fact I don't know what use can be made of them; they have no size in them.

21,960. Are you aware that the trawlers have caught a large number of good doreys lately?—Yes; but I think they would get more if it were not for the course of fishing they are pursuing. I believe they acknowledge themselves that they are doing themselves injury by trawling in the bays.

21,961. Are you aware that they themselves don't complain of any falling off in the number of fish?—I believe they had a very good season this year, but in other years they have made bad seasons.

21,962. Has that not been rather on account of the weather than on account of any falling off in the fish?—There is plenty of ground for them to trawl upon without going into the bays and injuring the fishing of other people.

21,963. (*Mr. Lefevre.*) Then if a regulation were established that trawlers should keep out of the bays, would that satisfy you?—Yes, they ought to be kept out a certain distance; and as to trawling in the bays, I think they do great injury in that way. They go where our boats are riding, and using hooks and lines, and they tear them all away.

21,964. But if you ascertained their numbers, you are aware that they are liable to be prosecuted for doing that?—Yes, but they do it notwithstanding. There is also great difficulty in finding out who it is that does it. Three years ago they did considerable damage to a boat belonging to me off Deadman Point. That is like robbing a man's house; but they don't care what they do when they are trawling by night.

21,965. You are aware that if the number of the boat had been taken they could have been summoned?—Yes; but I don't suppose any of our boatmen can either read or write.

21,966. Have you been engaged in purchasing fish in this place?—Yes, for the last 40 years; that has been my principal means of living here for the last 40 years.

21,967. Do the fishermen here now take their fish into Plymouth more than they did formerly?—They do in some seasons, but we have a very good demand for fish here. We have some men who come from a distance of 30 or 35 miles for our fish.

21,968. Purchasers?—Yes, they buy of us all the year round.

21,969. But nevertheless the fishermen take their fish more to Plymouth than they did formerly?—Yes, for about two months in the year.

21,970. Have you observed the same falling off in the quantity of the pilchards as the other witnesses?—No; last year there were pilchards enough on our coast for all the world. That has been the case for the last three or four years.

21,971. Then is it chiefly with regard to hooked fish that you complain of a falling off?—When the pilchards strike in they strike in in great abundance.

21,972. Do you confirm what the previous witnesses have said as to the consumption of pilchards?—Yes. Last year Mr. Fox's seines caught pilchards in Mevagissey, but he would not let his men sell one to the poor in our country. All of them were salted and exported. You will see, therefore, that if the drivers don't catch fish to supply a quantity the poor people hereabout would starve.

POLPERRO.
C. Jolliffe.
28 Mar. 1864.

21,973. But you send off a great quantity of fish yourselves by the railroad?—Yes.

21,974. How long has the railroad been here?—Three years last October.

21,975. You send them to Liskeard?—Yes.

21,976. That is the station to which you send your fish?—Yes; there is one thing more about trawling. Some years ago a man here named Barrett, who has now been dead for several years, used to have a little net. What I am going to state will show that the trawling does injury. Perhaps he would catch as many as 80 surmullets in the course of the day. Now you will shoot 600 fathoms of net, and you will not catch 30 in a day and night. I shot 600 fathoms last year, and I believe I never exceeded 26. I have seen thousands of these surmullets at Plymouth not longer than my finger, and not worth a farthing. All these were caught by trawlers. They would have been worth 1*s.* apiece if they had been caught properly in the right season.

The witness withdrew.

JONATHAN COUCH recalled and examined.

J. Couch.

21,977. (*Professor Huxley.*) You wish to add something to your previous evidence?—Yes, I think I can account partly for the falling off in the crabs. I don't impute that falling off to the trawlers. I am not alluding to the small crabs which the fish eat, but to the common edible crab. I have noticed that in former years what is called the bun crab, which means the female crab, was sometimes caught by our old fishermen. They used to twist off the two best claws, and throw the crab back again into the sea alive. The consequence was that they were preserved, but now they sell the whole they catch. In regard to the lobsters, there are one or two things I should like to mention. For a number of years I have been engaged in making observations, and I have wished to obtain a young small lobster. I have offered any price for one, and yet I could never get one. I never saw one less than my little finger. I have offered a large price, and tried to make it the interest of the men who are engaged in catching them continually to obtain one. I have taken them when they have been breeding and have had young, when they have been emerging from the egg, but I never got one less than my finger, so that there is no destruction in any kind of way in that respect. I never found them less than that in the stomachs of any kind of fish. What is the cause of that I am not sufficiently instructed, and am therefore unable to say. I have a copy of the Act of Parliament before it passed.

21,978. What Act is that you refer to?—The Act that was subsequently passed to carry out the provisions of the Convention. I have a copy of it just before it passed. Sir Antony Perrier sent me a copy, so that I might make suggestions upon it.

21,979. How long is that ago?—When the Convention was entered into with France. It was laid down in the Act that lobsters should not be caught after the 1st of July. Now there is no earthly reason that I know why they should not be caught. There is not a single month in the year in which they don't breed.

21,980. There is nothing about it in the Act of Parliament as it passed?—Then that clause must have been omitted. The next remark I wish to make is this. Perhaps the Commissioners will not be aware of the fact that our men have mapped out the bottom of the sea as regularly as you have the land. They have certain places which they call their marks, and if they are outside of the land they know these marks by the bearing of the land. I have a copy of the whole of them, and it is those marks that are principally concerned in the operations of the trawlers. When they go off as they do sometimes out of sight of land for congers, they will catch the congers on the plain ground. These congers, by all I can ascertain, are accustomed to burrow into the bottom, and of course if the bottom is trawled away the congers must decrease. Close to our land there are a number of congers of a black colour caught among the rocks, but the larger ones always go away from the rocks to the plain ground; perhaps 10 leagues from the land.

21,981. (*Mr. Lefevre.*) Have you any reason to believe that the trawlers catch lobsters outside?—They can catch small ones; they breed undoubtedly within a quarter of a mile of the land. The small ones would have the same appetites as the large ones, and go into the same crab-pots, and yet as I have said I never saw one smaller than my finger.

21,982. (*Professor Huxley.*) Lobsters eat carrion, do they not?—Yes.

21,983. Is there anything else that occurs to you, Dr. Couch?—No, there is nothing more.

The witness withdrew, and the inquiry was adjourned until Tuesday the 29th March, at Mevagissey.

Mevagissey, Cornwall, Tuesday, 29th March 1864.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

JOHN SAMPSON JAGO called and examined.

MEVAGISSEY
J. S. Jago.
29 Mar. 1864.

21,984. (*Professor Huxley.*) I believe, Mr. Jago, that you have known Mevagissey for many years?—Yes, I was born in Mevagissey.

21,985. How many years have you been acquainted with the fisheries here?—Ever since the year 1816; in point of fact ever since I returned from sea.

21,986. Are you able to inform us what the population of Mevagissey is?—It is about 1,900 and odd at the present time. I cannot say what the exact number is, but I know that it has gone back from 2,200 down to 1,900.

21,987. Then am I to understand that the population is diminishing, and has been diminishing ever since you have known the place?—I think during the first few years that I knew it it increased. The fisheries were very productive from 1816 up to 1818, and the population increased then.

21,988. Out of that population are the great majority of persons engaged in fishing?—Yes.

21,989. Is there any other branch of industry here of any importance?—No, none of any importance.

21,990. How many boats are there employed in the fishing?—I cannot say exactly; I believe 40 or 50 drift boats, and 11 or 12 seines went out this year. I was not down this year at the fisheries, but I believe that 11 or 12 went out. Some of the men here will be able to correct that if it is incorrect.

21,991. Has the number of boats increased or diminished?—The seines have materially diminished. In the year 1818 we had 44 seines. I do not believe there are more now than 14 or 15 belonging to this town.

21,992. Has any other mode of fishing increased as seining has fallen off?—The drift-boats have increased,—those boats which are engaged in driving.

21,993. Then taking the seine boats and the drift-boats together, has the total number decreased or increased?—If we put three boats to a seine there

MEVAGISSEY.
J. S. Jago.
29 Mar. 1864.

would have been 132 boats in 1818. I do not know exactly how many seines there are in the town now, but I believe there are about 14.

(*A fisherman.*) 11 is the number.

(*Witness.*) In taking three boats to each seine that would give 33 boats, but in seining there are about 50 drift-boats I believe; I cannot say exactly the number, but there are between 40 and 50.

21,994. Probably the number of persons engaged in fishing is about the same, they have only changed their mode of fishing?—I think not; because when we had 44 seines at sea we sent nearly 800 men and boys in the water in the evening. Then there would be 16 men and two boys to each seine; therefore you would have 44 times 18, which would make 792. Now we have only 11 seines here, which give employment to about 198 persons. Perhaps there are more seines in the town. My own opinion is that there are, but only 11 went to sea last year.

21,995. Can you account for the falling off in the seine-fishing?—Yes, I account for it by the absence of fish. They fall off every now and then. Sometimes they will fail for several years successively. They have frequently failed for six or eight years together. I have made a memorandum which will give you an account of the fishing for many years. It refers to the state of the fishing very many years ago. I wished to inform myself what the average catch of a seine was for a series of years, and I have prepared this statement purposely. If you will examine it you will understand what I mean when I say that for six or eight years successively there were no fish, and that they then returned again in large quantities. I have taken three independent seines and calculated the quantity of fish they have taken. Now in early days each seine averaged 375 hogsheads. The take varies very considerably; in one season a seine took at one catch as much as 1,400 hogsheads. During the next 10 years the average only came to 221 hogsheads; in the next 10 years there was a great falling off; it fell from 221 hogsheads down to between 80 and 90, that was between 1780 and 1790, and this year was generally considered a failure. In Mevagissey there was in consequence very great distress in the year 1790, and there was a severe fever which arose from poverty, distress, and one thing and another. During the 10 years beginning in 1780 and ending in 1789 the average was only 82 hogsheads; there were no driving boats then, at least if there were there were only one or two; I believe there was not more than one at all. Then we go from 1790 to 1799; and the average during those ten years, taking one year with another, was considerably above what it had been in the previous 10 years. In 1790, 680 hogsheads were taken in the fisheries.

21,996. Then there appears to have been a sudden recovery?—Yes, they came in in immense masses in 1790 and in 1791. That went on for some years. Then we go from 1799 to 1809; the total number of fish caught by the seines during the 10 years ending 1809 was 2,585 hogsheads, giving an average of 258 hogsheads per year. In 1810 and 1811 the seines caught nothing at all, but that was the time of the war. There were immense quantities of fish in at that time. I believe they could have caught what fish they liked but there was no sale for them; they could not send them abroad. The French had got hold of the Italian ports and altogether stopped the trade. Yet notwithstanding that nothing at all was done in those two years, the average for the 10 years commencing in 1810 and ending 1819 was 290 hogsheads each seine per year. In 1812 the catch per seine amounted to 1,400 hogsheads, while in 1818 it was only nine hogsheads. We had then 44 seines fishing, the fisheries had been very productive and the price was very high. People here speculated very largely in the fisheries and they built a new pier at Mevagissey. Then directly afterwards, from 1818, the fisheries began to fail, and even with their 44 seines they did not succeed in catching anything in 1818 or 1819, nor yet in 1820. In 1821 and 1822 there was only one seine which averaged 12 hogsheads.

21,997. Were there no fish here then?—No; and there were no drift-boats to speak of.

21,998. How many years was that after the first falling off; the first falling off was, I think, in 1790?—Yes, from 1788 to 1790 was the first falling off.

21,999. Then the second falling off would take place 30 years later?—Yes. In 1809 they were very scarce; there was hardly a fish caught in Mevagissey, but that might have arisen from a bad look-out having been kept.

22,000. When did the second falling off take place?—From 1818 to 1830.

22,001. That would be 30 years after the first failure?—Yes. In 1830 there was a large quantity of fish caught of very good quality, and the seines then averaged 495 hogsheads; but after that they began to lessen again as the drift-boats became more plentiful.

22,002. (*Mr. Lefevre.*) Were there still the same number of seines as in 1830, namely 44?—Very few went out. From the year 1818 they were owned principally by large speculators who could stand the rub. The fish that were caught then were sold for a mere song, and seines that cost 50*l.* and 60*l.* to make and keep up did not make 8*l.* or 9*l.* From 1840 to 1849 there were valuable catches. The average was 160 hogsheads each seine per year. There were, however, some failing years; for instance, in 1842 and 1845 there were none caught. The total catch was only 1,609 hogsheads. In 1830 what was called a travelling shoal came. We imagine that there is a difference between the travelling fish and the bay fish—that is the opinion of all the fishermen here.

22,003. (*Professor Huxley.*) How far does that record from which you have been reading extend?—It extends altogether up to 1862. From 1850 up to 1859 the total catch was 1,124 hogsheads, which makes the average 112. The years 1854 and 1855 were failing years, but there had been good years before; 1850, 1851, and 1852 were very good years, but 1854 and 1855 were bad; 1856 was a good year, but from that time up to the present there has been a constant failure with regard to the majority of the seines. In 1861 there were very few, and also in 1862; the next year they returned again in large shoals.

22,004. Were there large numbers this year?—I cannot give you this year's returns yet.

22,005. How much was there last year?—I do not know.

22,006. Do you recollect to have heard any cause assigned for the falling off in the year 1790 or thereabouts?—We cannot account for it. I believe myself that the fish all come from the south.

22,007. There is no positive evidence on that subject?—No, I think not.

22,008-9. (*Mr. Lefevre.*) Can you add to the list the number of seine nets each year?—I am not able to do so at present, but I can obtain the information and send it to you.

22,010. (*Professor Huxley.*) Do I understand that you cannot account for the increase of last year's fish?—The last year there was a large quantity of fish came on the coast; I believe they all came down from Brest. The captain of a merchant ship told me that in coming from Brest during the whole of the night the sea appeared as if it were on fire, and the fish appeared to be coming this way. I have been at Corunna and have seen them there; they are generally there at the end of April or the beginning of May. They are at Quiberon in July, and at Brest after that. I believe, however, that they fail there the same as they do here.

22,011. Has there been any remarkable change in the appearance of the pilchards on the coast?—They vary very much.

22,012. It has been stated to us that during the last 20 years or so the pilchards have been getting later in their appearance?—Within the last 20 years

I have known the fish here in July. The seines were shot here one year at the end of July.

22,013. We have been told that the falling off in the seine-fishing has been partly due to the circumstance that for the purpose of securing the successful use of the seine it is necessary to have calm weather; that during the early months of the summer when there was calm weather there were no fish, and that when the fish made their appearance in the latter part of the summer the weather was so bad that it was impossible to use the seines with advantage. If the fish had made their appearance as they used to do at a different period, we have been informed that there would have been large takes. It is said that when the fish have been here the fishermen have been unable to use their seines without the risk of losing them altogether, and that consequently there has been a falling off in the fish. I wish to know from you whether that is the case or not?—I do not think that it is. I have known large quantities of fish caught in a gale of wind when they came in in large bodies; generally when there is a heavy gale of wind it prevents the boats from getting out, but it does not arise in any way from the fish coming later in the season.

22,014. You do not think, for example, that the pilchards making their appearance off Mevagissey very late would interfere with the fishing?—No, because we should get fine weather here then, unless we had a strong easterly wind; that is the only thing that would prevent us in Mevagissey Bay from catching fish. Sometimes we have a strong wind from the north, but not often. I do not know that the weather has very much to do with the fishing here.

22,015. When the weather is good enough for using the drift-net boats can you also use the seines?—I should say that we could.

(*A fisherman.*) No.

(*Witness.*) A fisherman here says no, but I think we could.

22,016. What other kind of fishing is there besides the pilchard fishery at Mevagissey?—There are two small trawlers, I believe.

(*A fisherman.*) There is only one now.

(*Witness.*) They were very small; in point of fact they were only boats.

22,017. They were not vessels of any tonnage?—No, they were not of any size; they were merely open boats.

22,018. Is there any hook-and-line fishing here?—Yes.

22,019. How many boats are there that follow that?—I do not know how many boats there are now, but it is generally the privilege of the master of the seine who controls the seine-fishing in the season to have a boat all the year round, and he uses it in hook-and-line fishing.

22,019*a*. Then the same boats are used for hook-and-line fishing as in seine-fishing?—Yes; but in the seining time they drop the hook-and-line fishing and the master attends to the seine.

22,020. Do the drift-boats go hooking sometimes as well?—Yes, and very often they catch some fish with a hook while they are drifting.

22,021. Then what is the season for hooking here?—All the year round, but in the spring and winter they do not get quite so much.

22,022. You mean about this time?—Yes.

22,023. Do they use hand-lines or long-lines?—Hand-lines generally. Some few of them use long-lines.

22,024. Have you ever been possessed of a seine-boat yourself?—Yes.

22,025. What does a seining boat cost?—I bought last year a new one. Do you wish to know what the cost of the boat is alone, or the cost of the boat and the net.

22,026. Let us have the boat first?—About 15*l.*, that was what I paid for one last year.

22,027. Was that with the fittings of the boat?—No, I mean only the boat.

22,028. Without oars?—Yes.

22,029. What would be the cost of a boat with its fittings—the cost of the boat, the sails, oars, and the like, take it on the average?—Of one boat?

22,029*a*. Yes.—I think I could tell you better what the whole would cost.

22,030. Supposing you wanted to fit out a seine-boat with nets and everything that belonged to it, what would it cost?—It would cost pretty nearly 800*l.*, I should say from 700*l.* to 800*l.*

22,031. Then the principal cost would be for the nets?—Yes, nets and ropes are the great things. I have all the particulars at home, and can give you the exact cost of these things.

22,032. You are required to have three boats to each seine?—Yes, and some have four; they have a small boat attending upon them. The fishing-boats are rather too heavy for the purpose for which they use the small boat.

22,033. How long are your seines?—I believe they are about 220 fathoms. Some of them may be 205 or 210, but a few of them are larger than others.

22,034. What is the depth?—The depth will be about 14 fathoms.

22,035. What is the size of the mesh they use?—The Dungarvan mesh, but what the size of it is I really forget. I believe it is about 19 to the foot.

22,036. Nineteen to the foot?—Yes, we call it the Dungarvan mesh.

22,037. It is a very small mesh?—It is considered to answer the purpose.

22,038. What is the size of the mesh from knot to knot?—Here (*producing a piece of net*) is a portion of the net we use.

22,039. That is a half-inch mesh. Is the whole net made of meshes of that size?—Yes.

22,040. Is the net made with a pocket?—When they take in the seine they make a little belly in this way:—they shoot a large seine and enclose the shoal, and they then have a smaller seine which they put round. They use it for taking the fish up out of the larger seine. They make that with a kind of little belly; but its object, I imagine, is rather to hold in the fish when they are taking up the seine.

22,041. What is the length of your seine?—It should be 220 fathoms; some of them are 203 and others 210. They vary in length up to 220 fathoms.

22,042. Will you describe the mode of fishing. How many boats do you send, to begin with?—Three. In the first place there is the lurcher, which goes ahead of the other boats. If the man in charge discovers a shoal he makes a signal to the in-shore boats—to the two boats carrying the seine, to lay stern to stern. As soon as they receive the signal they separate, and if they are near enough the master seiner gets the seine out as rapidly as possible and they surround the shoal.

22,043. Then does one of your boats have the seine on board?—It is carried by two of them. One has the large seine, and that is called the seine boat.

22,044. How many men has that boat?—It has a crew of seven men.

22,045. How many men has the other boat?—Seven.

22,046. How many are there in the lurcher?—Two men and two boys.

22,047. I understand you to say that the lurcher looks out for the shoal?—Yes.

22,048. And signals the other boats to come to him?—Yes.

22,049. Then does the other boat that has not got the seine on board take the warp?—Yes.

22,050. And they pay it out round?—He takes the warp and runs it in-shore, and warps the seine in. The seine goes round the shoal, and the second boat runs away with the warp and pulls it in where the master seiner thinks is a fitting place for drawing the seine. That sometimes depends upon the depth of water, and whether they are able to draw it in, as sometimes they are forced to hold on.

22,051. They never attempt to haul the seine on shore?—No.

MEVAGISSEY.

J. S. Jago.

29 Mar. 1864.

22,052. They simply enclose the fish?—Yes, and if there is a quantity of fish that renders it worth while to moor the seine, they will moor it, and then they use the other seine for taking up the fish.

22,053. How do they manage to get the fish out? Do they haul the seine gradually in?—They get in where the master thinks there is shallow water, so that the net will be down to the ground and prevent the fish from escaping.

22,054. Then they take the fish out with the smaller net?—Yes.

22,055. What is the size of the smaller net?—It varies from 80 to about 100 fathoms.

22,056. Is that the net with the pocket?—There is a little belly which makes a sort of pocket. It is left a little slack merely to form a bag.

22,057. Do they haul in the slack from the bottom?—Yes; when they get a bottom the fish are in a kind of bag.

22,058. How long will the fish be enclosed in the principal seine without coming to harm or damage?—I have heard of their being there for a fortnight.

22,059. A large shoal has remained in the water as long as that?—I have heard so. I think in Mevagissey they took 1,500 hogsheads, and I believe they were a fortnight in taking them up.

22,060. Do the fish become damaged when they remain in the water so long?—We may get a small portion of them damaged—at least I have heard so—but not much.

22,061. Why have the people here of late years taken to the drift-net fishing?—I suppose they have found it more profitable to themselves.

22,062. Do they follow the mackerel fishery as well?—Yes, some of them.

22,063. Is it possible to work the seine far out at sea?—The depth of the seine is only 14 fathoms, and then they have to take into consideration the tide.

22,064. (*Mr. Lefevre.*) Can they fish with the seine in deeper water than 14 fathoms?—No.

22,065. (*Professor Huxley.*) That is the depth of the net?—Yes. If they were to shoot in a greater depth than that they would not touch the bottom of the ground.

22,066. Then if the pilchards don't come in-shore the seines cannot be used?—Of course not.

22,067. The pilchards come in-shore less of late years than they did formerly?—I don't think they have come in less, but the seine fishermen have been hindered by the drift-net fishermen coming in so closely. In former days they would not allow the hook-and-line boats to go and fish among them.

22,068. It would be to the advantage of the fishermen to catch them with the seine if they came in as they did formerly?—They do catch them with the seine still, but the fish are disturbed so much by the drift-nets coming so near the shore and in among the seines, that the seine fishing is not so good as it was years ago.

22,069. A drift-net costs very much less than a seine-net?—Yes.

22,070. I suppose you don't know the value of a drift-net?—No, but it is of considerably less value than a seine-net. It does not require so many hands to work it.

22,071. So that it is a less expensive mode of catching fish?—Yes. At the same time I believe it is a good mode if it don't interfere with the in-shore fishing. I think it would be a great benefit to the country that both should be protected.

22,072. You think that the drift-net fishing disturbs the shoal-fishing?—Yes, particularly the bay fish. There is very little doubt of that. I am speaking now not of what we call a travelling shoal, but of the bay fish. There are pilchards off this place now, I believe, but they are not fit to cure.

22,073. It is your opinion with regard to the bay fishing that the drift-nets very much interfere with the seine men?—They do at present, but they would not do so if they kept a sufficient distance away from them.

22,074. What do you think would be a fair distance?—Three miles; but they will now come within less than half a mile.

22,075. The Act of Charles II. lays down three miles as the distance within which they shall not come?—Yes.

22,076. Have any prosecutions taken place under that Act?—I believe they used to prosecute, but the lawyers can ride through that Act. I have known fishermen taken before the magistrates, and I have also known a conviction to take place.

22,077. You have known a conviction to take place?—Yes, at Truro.

22,078. How long ago is it since the last conviction took place?—I cannot say.

22,079. Is it 20 years ago?—I should think it is.

22,080. Are you acquainted with any case in which the Act has been put into operation during the last 20 years?—I don't know of any case within the last 20 years, but I think the last case was at Truro or Bodmin.

22,081. We are informed that there has been a good deal of bitterness between the drift-net men and the seine men?—Yes; the seine men consider that when the drift-net men come right in among them they disturb the shoal. I have no doubt myself that they have done a great deal of injury.

22,082. If the Act were really operative could not convictions be obtained?—I believe the expense is really the thing that has prevented that.

22,083. The expense of obtaining convictions?—Yes.

22,084. What is the cause of the great expense?—The lawyers, I imagine.

22,085. But the value of a shoal of fish taken by the seine is enormous, so that the expense of a prosecution, if the law really held good, could not have been anything to compare with it?—Yes, the takes are enormous.

22,086. Yet you think prosecutions have not been undertaken on account of the expense?—No doubt the expense has been one thing.

22,087. What is the value of the largest shoal you ever knew of?—I had charge of a set of seines once, and that set brought 3,300 hogsheads of pilchards in one catch.

22,088. What was the value?—At that time they would not be of so much value, but at present they are selling at from 40*s.* to 55*s.* per hogshead. The price varies very much according to the quantity caught. I have known them at 33*s.* a hogshead, and I have known them sell as high as five guineas a hogshead.

22,089. We have been told of 10,000*l.* worth of fish being caught in one seine. Have you ever known of a catch of that sort?—I think not; but it would depend very much upon the price.

22,090. You don't know of a catch of that sort?—No. The utmost I know of is the 3,000 hogsheads which I have mentioned. That catch occurred in Gerran bay. They considered that we had nearly 4,000 hogsheads, but the pilchard net gave way.

22,091. Do you think that 5,000*l.* would be a fair estimate?—That would depend upon how many hundred hogsheads were caught. In the year 1830 one seine here must have had 1,400 hogsheads. That is about the heaviest run we ever see here.

22,092. I ask you this because it appears to me that if the value of the contents of a seine is anything like what it is commonly stated to be, the cost of a prosecution would be very small in proportion?—I have shown you the average catch of a seine since 1760.

22,093. Do you think the cost of prosecution is too great to make it worth while to prosecute?—Yes, I have no doubt of it, when the fishery now is barely paying the interest of the money embarked upon it.

22,094. Do you of your own knowledge know much of the drift-net fishing? What becomes of the fish

they catch?—They sell some of it fresh, and a large portion is exported.

22,095. Do the population of Cornwall depend to a large extent for their food upon the pilchard?—The Cornish men will eat pilchards anywhere if they can get them; they value them beyond anything.

22,096. Do the mining and agricultural population habitually make pilchards a large part of their food?—I do not know whether they make it a large portion of their food, but they lay in some for winter stock. It is considered a great thing for the poor to have these pilchards.

22,097. When the fish are taken by the seine-nets in large quantities, is it the custom of those who take them to cure them all at once for exportation?—They cure as much as they can, and they sell some fresh.

22,098. I believe that the hauls of the seines only take place at comparatively rare intervals?—We commence generally in August.

22,099. But you may not get a haul once in a fortnight?—Sometimes they come in on several occasions, but we rarely have more than one or two catches. The seines will be shot two or three times if the fish set in for the bay.

22,100. Is it not the case that in the season you will get but two or three big hauls?—Yes, or small hauls, as the case may be.

22,101. So that seining would not furnish a regular supply to the population?—No, only in the season. We have had them up here in November. We had them caught here in November some years ago; we got a good deal in the bay adjoining here.

22,102. The supply from seining is occasional. Sometimes you get a large haul, and in the intervals you get none?—Yes; often we get them in November.

22,103. How many drift-boats go out from this place?—From 45 to 47, I believe.

22,104. How long does the season for drift-net fishing last?—They begin rather earlier.

22,105. In what month?—About the middle of July.

22,106. And they go on drifting till when?—They go on fishing as long as the fish are here.

22,107. But on the average how long will the fishing last?—Until Christmas; in November there is generally a great catch.

22,108. Is it the habit of the drift-net fleet to go out every night?—Yes, they go out every night, either hooking, drifting, or something.

22,109. During the season they go for pilchards?—Yes, except Sundays.

21,110. And they shoot their nets?—Yes.

22,111. Sometimes they get big catches, and sometimes very small ones?—Yes, they vary.

22,112. But they always bring in something?—I think very few fail to bring in something. I cannot speak, however, except by hearsay, but I think very few fail. I believe that some catch more than others.

22,113. You often go down to the quay here to see them come in?—I have not done so lately.

22,114. But you know that they always bring fish from repute?—I generally get a report brought me of what is going on.

22,115. Then under these circumstances I presume that during the season there is a pretty regular supply of pilchards brought into port?—Yes, more than they can sell fresh sometimes.

22,116. But their great market is the fresh market?—That has not been so of late years when they have caught any quantity.

22,117. What do they depend on for their steady remuneration?—They can almost make as much now by salting the fish as they did before by selling them fresh.

22,118. Do they sell them to the hawkers?—Yes, they supply the hawkers in the season when the seines are not out.

22,119. And the hawkers sell them all over the country?—Yes.

22,120. Does the permanent supply to the poor of Cornwall depend on the drift-net fishermen, and not on the seine-nets?—I rather think they get more from the seine-nets, because they get them ultimately at a cheaper rate.

22,121. (*Mr. Lefevre.*) I think you said that you yourself were owner of a seine-net?—Yes.

22,122. How long have you owned the seine?—I have had it since 1835, but my family have owned seines for the last 100 years.

22,123. Are the seine-nets mostly owned by capitalists, or by fishermen?—They have now got into the hands of a few of the principal men, but they used to be owned by sailors and fishermen.

22,124. The fishing-boats belonged to fishermen?—Yes.

22,125. Do you recollect the time before the bounty was taken off?—Yes.

22,126. Did that have any effect on the number of seine-nets?—I think it would have an effect on the profits of the seine-nets. They used to catch 250 hogsheads on the average in a season, and they would get 250 eight shillings. Eight and sixpence was what they got, but they kept back 6*d.* That went in paying the wages of the men.

22,127. Was there an important falling off in the number of seines after the bounty was taken off?—I don't think there was so much falling off in the number of seines as there was in the fishery. The failure of the fisheries and the coming off of the bounty occurred pretty much at the same time.

21,128. Was there an increase in the number of drift-boats after the bounty was taken off?—An increase did begin, but it did not go on very rapidly.

22,129. I see from the return you have prepared that there were in 1820 only two drift-boats, but that in 1830 there were 10?—Yes.

22,130. Was that owing to the taking off of the bounty?—I think not. Perhaps the failure of the fishery, and the fact that the drift-net boats could catch fish which could not be caught by the seine-nets, induced them to set up drift-boats.

22,131. You say the drift-boats are not altogether dependent on the pilchard fishery?—If the pilchard fishery fails they can take to the mackerel fishery, and if that fails they can go to the hook-fishing. They follow all three.

22,132. But for the time being the taking off of the bounty was a blow to the fishery here?—Yes, it was the ruin of many persons who were engaged in the fishery.

22,133. It fell principally upon the capitalists?—Yes.

22,134. Do you export your pilchards direct from here, or do you send them to Falmouth?—We export them from Mevagissey.

22,135. Do you export nearly the whole of the produce of the seine-net fishery?—Yes, and of the drift-net fishery too.

22,136. Is almost the whole of what the seine-net produces exported?—Yes, except what is sold to go into the country fresh.

22,137. What has been the average price of the pilchards during the last few years?—I think the return that I have prepared shows that it varies very much. For instance, in 1850 the average price was 44*s.*; in 1851 it was 39*s.*; in 1852 it was 32*s.*; in 1853, 38*s.*; in 1856, 47*s.*; and in 1857, 45*s.*

22,138. Then the price has risen lately?—Yes, but it is difficult to obtain the exact average. The prices of different classes of pilchards vary very much. Perhaps they may have for small fish 20*s.* a hogshead, and for large fish 40*s.* or 50*s.* In 1856 they sold for 47*s.* a hogshead.

22,139. On the whole has the average price fallen or risen?—I should say that the average price is better than it used to be.

22,140. How do you pay your men in the seine-net fishing?—When we had the bounty of 8*s.* the men got that 8*s.* a week.

22,141. Did they get any more when they engaged in the fishing?—Yes, they got a share when the

MEVAGISSEY.

J. S. Jago.

29 Mar. 1864.

bounty was taken off. An arrangement was come to that the fishermen should bear their proportion of the loss, so that they then got a third of the fish sold fresh, and a fifth if they were cured.

22,142. Was it a third of the price or bulk ?—A third of the price.

22,143. Was it the custom to settle with them at the end of the season ?—Yes.

22,144. What more did they make in the course of a season ?—That depended much upon the catch and the price.

22,145. Can you form any idea of what the average would be ?—I cannot say. I have heard that some of the seiners, when they have got a large catch, have paid 20*l.* a man, but of late years the men have hardly had anything.

22,146. Do you find that the men are more willing to go out in the seine-net fishing, or the drift-net fishing ?—Perhaps you will allow me to say that fish were taken by the seines in 1862 from August 27th until October the 30th ; in 1861, from October the 1st to the 7th ; in 1860, from September the 3d ; in 1859, from August 3d ; in 1858 there were no seine-nets shot ; in 1857, from August 27th ; in 1856, from August 13th ; in 1855 there was scarcely any fish got ; in 1854, from August 14th ; and in 1853, from the 31st July. They came in then from July up to August 24th. In 1851 they were taken from July 30th to October 29th ; in 1850, from August the 11th to the 31st ; and in 1847 and 1846, from August until the end of October. Between these dates the fish were taken to our cellars.

22,147. Are the men more ready to go out in the seine-boats, or in the drift-boats ?—There are many sailors who go in our seine-boats.

22,148. Do you find any difficulty in getting hands? —We have often not enough of men ; they are not as plentiful as they used to be. We have more countrymen than formerly when the fish was more plentiful.

22,149. Do you ever find any difficulty in getting a sufficient number of men to work the seine ?—I don't know that we ever had.

22,150. I think you said there was only one trawl-boat from Mevagissey ?—Yes, I believe there is only one.

22,151. Do the Plymouth boats come off here ?—I don't think they come further than Looe, about 10 miles off.

22,152. What is the nature of the bottom, is it rocky ?—There are splats of rock here and there.

22,153. Is the ground smooth or rocky generally ? —There are splats of rock where we go to fish upon. I believe that near those splats of rock there are good breeding grounds for the spawning of the fish. Years ago we had immense catches. I believe the Plymouth trawlers came there, and after that they said the men ought to be hanged who went there. They discovered that it was spawning ground for the fish and they took away immense quantities of spawn.

22,154. Do the drift men fish constantly within a league and a half of the coast ?—They seldom go much beyond that.

22,155. The drift-boats ?—Yes ; sometimes they may go 20 or 30 miles out.

22,156. But are they constantly fishing within a league and a half ?—Yes, they go wherever the fish are.

22,157. Are the fish constantly found within a league and a half of the coast ?—I should think not, but they follow them wherever they go.

22,158. I want to know if they are constantly found within a league and a half of the coast ?—No.

22,159. Are they often found beyond that distance ?—They are constantly found beyond that distance ; they are rarely found within it.

22,160. What did you say was the shortest distance within which you could fish with the seine-net from the coast ?—We can only fish with the seine-net in 14 fathoms of water. Perhaps half a mile.

22,161. You cannot probably use the seine-net beyond that distance ?—No, not further than from a quarter to half or the third of a mile. You may go out to the points of the head and you may seine about half a mile from the coast.

22,162. (*Professor Huxley.*) During the years that the seine-net fishing failed altogether was there any yield from the drift-fishing ; did they go on as usual ?—Yes, they went on as usual.

22,163. So that there were pilchards here although the seine men could not catch them ?—Yes ; there was one year, I believe, that the drift-net fishery failed ; that was the year 1830. There was no trade then for the sale of fish ; they had to carry them to Plymouth.

22,164. That was one of your travelling shoals ?— Yes.

22,165. When, in other years, the seines failed altogether in consequence of the shoals not coming to the shore, have the drift men got a fair supply ? —Their take has varied much.

22,166. Under those circumstances if the drift-net men had not existed you would have had no pilchards of any kind ?—We should only have had very few ; some years there has been no seine shot at all.

22,167. (*Mr. Lefevre.*) Would it be possible to get a return of the quantity of pilchards exported from this port during the last 20 years ?—Perhaps not from this port alone but from the county.

22,168. That would do as well, although I should like to have a return also from this port ?—This (*handing in a document*) is the quantity exported from the county.

22,169. Is there any quantity of fish sent by train from this place ?—They are getting into a trade in that way with hooked fish.

22,170. But no pilchards are sent away in that way? —No.

22,171. Pilchards are not sent to London generally ? —No.

22,172. Do they not send them out of the county ? —Yes, in some places, but not many.

The witness withdrew.

J. Ley.

JOSEPH LEY called and examined.

22,173. (*Professor Huxley.*) You are a pilot here, I believe ?—Yes.

22,174. How many years have you been hailing from the port of Mevagissey ?—About 35 or 40 years.

22,175. Have you been connected with the fishing all that time ?—Yes.

22,176. Have you yourself been a practical fisherman ?—Yes.

22,177. Or have you been more a pilot during that time ?—I have been piloting some part of the time, and sometimes I have been fishing.

22,178. What mode of fishing have you been in the habit of practising, seine-fishing or drift-fishing ?—I have been seining for some years and drifting also.

22,179. Then you are acquainted with both ?— Yes.

22,180. Did you ever have a share in a seine net yourself ?—I have been the master of one—of a stop seine.

22,181. Then you are thoroughly familiar with the working of the seine net ?—Yes.

22,182. But you have never been actually interested pecuniarily in one ?—Not as far as having a share in a seine net. I have been interested in the seine-fishing but I have never had shares.

22,183. You have heard the mode of fishing described by Mr. Jago. Do you agree with him in the evidence he has given ?—I agree with him in his evidence and also in the statement which he has read to you, especially with regard to the state of the fishing—about eight years before the year 1790. I have had that handed down to me from my father,

grandfather, and great grandfather, all of whom were fishermen. What Mr. Jago stated is quite correct. Eight years before the year 1790 there were no fish, and the green grass grew in our cellars. There was not a drift-boat in the place then with the exception of one in Charlestown.

22,184. At that time there were no drift-men?—Not one.

22,185. Was there any reason to believe that the fish were off the coast during those years when none were caught?—I have heard that the fish were off the coast.

22,186. But they did not come in?—No.

22,187. With regard to the mode of fishing and the kind of nets used, which have been described to us by Mr. Jago, do you agree with him as to the mode of shooting the seine and so forth?—Yes; when the seine is shot it goes right out on the warp and then they warp the seine in.

22,188. Do you seine more during the night or in the day?—We catch more in the day in general. I have nothing to say against what Mr. Jago has said, except that in most cases the men engaged in seining are taken from the country, except the master and perhaps a few other men.

22,189. The master and a few other men only are sailors?—Yes.

22,190. Are landsmen employed?—Yes.

22,191. No particular seamanship is required?—No, not if they have a few good men and the master is a sailor.

22,192. When did the drift-men within your recollection begin to increase here?—About the year 1817.

22,193. How many were there when you first recollect the drift-net fishing here?—There were only one or two at first. There were only three for several years and then they went down to one again. Then they got up to five or six, and so they have gradually grown up.

22,194. They have steadily increased ever since?—Yes.

22,195. They have steadily increased during the last 40 or 50 years?—Yes.

22,196. Within your recollection how long is it since there were 20 drift-boats here?—They must have reached that number about 1830 or 1835.

22,197. Then between that time and now the increase in the number has been more than double?—Yes; in 1843 there were about 40 boats.

22,198. And now how many are there?—I think there are 50 or thereabouts.

22,199. I presume that the men who use the drift-boats must be sailors?—Yes, they are all sailors in general, brought up to the fishing from being lads; they go on till they get a craft of their own; there are a great many of them who have fishing boats now, some of them are the sole owners.

22,200. Then it is within your recollection that a great many who began as boys have earned sufficient by following up the fishing business to enable them to save money and purchase boats on their own account?—Yes.

22,201. Does not that show that the catch of fish in their case has been pretty steady?—Yes; I think they can get more fish in the offing and near the land in the summer time.

22,202. Have you ever known the drift-fishing fail altogether?—It did a year or two ago, and I believe also in 1830.

22,203. What was the reason of the failure?—The fish did not come on the coast. The fish you are aware are like birds of passage, they come after their prey; some years there are none, or scarcely any at all, but at the drift-fishing we generally catch some. There has hardly been a year in which they have not paid for themselves well, with the exception of one year.

22,204. Then all the failure you can recollect is that one year; there was then a total failure?—Yes, there was a great falling off one year, but even then it was not a total failure.

22,205. Did you yourself go drift-fishing for any number of years running?—Yes, for 10 or 12 years.

22,206. Did you keep any account of the yield of your fishing during that time?—No, I never kept any account.

22,207. Did you ever hear from anybody here what his take of fish was for a series of years;—No, I think not.

22,208. It is not the habit of fishermen to keep accounts?—No, it is not. I recollect once getting 27*l.* for going out three times fishing.

22,209. But still it is within your recollection that the number of fishermen fishing with drift-boats has steadily increased?—Yes, and it is still increasing.

22,210. And within your knowledge a great number of them have become owners of fishing vessels from having been boys in the boats?—Yes.

22,211. What sort of net do they use in the drift-fishing?—Pilchard nets. This (*producing a piece of net*) is part of one of them.

22,212. How many meshes are there to the yard from knot to knot?—There are 40 bars to the yard.

22,213. (*Mr. Lefevre.*) Is that the number of meshes when they are ordered from the net maker?—Yes.

22,214. They shrink a little in curing?—Yes.

22,215. (*Professor Huxley.*) This one is about three-quarters of an inch from knot to knot?—Yes.

22,216. How long is your fleet of nets for pilchard-drifting for each boat?—About 250 fathoms, but it depends on the size of the boat.

22,217. They vary?—Yes.

22,218. What is the average?—About 250 fathoms; some have got a longer fleet.

22,219. How much will a boat with its fittings and nets and everything complete cost? Supposing you wanted to set up a pilchard boat, with nets and all complete, what would it cost you?—About 220*l.* or 230*l.*

22,220. Then it would cost you about a quarter as much as a seining vessel?—Yes.

22,221. And out of the profits of the earnings of the drift-net fishing you have known many instances in which drift-net fishermen have saved enough to set up boats of their own?—Yes.

22,222. They have saved a sufficient sum of money to enable them to do that?—Yes.

22,223. (*Mr. Lefevre.*) Do they not occasionally get a little help from the capitalists?—They may get a little credit, but they generally earn the price themselves.

22,224. (*Professor Huxley.*) Do they pay off such mortgages?—Yes.

22,225. Do you fish at any particular time? Do you set your nets at any particular time?—We shoot our nets in the offing just when the sun is beginning to drop down.

22,226. You shoot your nets just before sun-down?—Yes.

22,227. Why do you do that; is there any regulation about it?—The fish would not go to the nets if we were to shoot them earlier.

22,228. Do you use twine for the nets, or cotton?—Cotton is more commonly used now.

22,229. Do you think that cotton is better than twine?—Yes, it is more pliant and better for the taking of fish generally.

22,230. Do you find that cotton is increased in price lately?—Yes, but we are obliged to have it.

22,231. (*Mr. Lefevre.*) Do cotton nets last as long as the other nets?—Yes, but that depends on how you cure them.

22,232. (*Professor Huxley.*) Your mode of fishing is as similar as possible to the herring-fishing?—Yes it is quite similar.

22,233. Do you have your net made fast to a warp at the top?—Yes, and we shoot the net over.

22,234. You have the warp or head-line and buoys?—There is a small line about 15 ft. with cork on the

MEVAGISSEY.
J. Ley.
29 Mar. 1864.

surface, and we sink the net 15 ft. under the surface.

22,235. What do you call the line that goes at the head of the nets?—The head rope.

22,236. How many fathoms deep is your net?—About four or five fathoms, some have them as much as six fathoms; they vary.

22,237. You go out whenever you see signs of fish?—Yes; but sometimes we shoot when we see nothing, and we find an abundance of fish.

22,238. Do you drift all through the night?—Yes.

22,239. What time do you make for port in the morning?—As early as we can; we get the nets up as soon as ever the day breaks; we know that the fish will not go into the nets after that.

22,240. Who buys your fish in Mevagissey?—People from the country come here in carts and take it away.

22,241. Hawkers and pedlars?—Yes.

22,242. Does any merchant buy your fish for salting?—Sometimes, but in general they are sold to go into the country.

22,243. Do you salt them if you get a heavy catch?—Yes.

22,244. And the fish is sold all over Cornwall?—Yes, it is sold for 10 or 15 miles round, up to Bodmin.

22,245. (*Mr. Lefevre.*) Is it sold fresh?—Yes, fresh.

22,246. (*Professor Huxley.*) During the 10 or 15 years that you have been fishing have you found that the fleet of drift-boats fishing here has brought a pretty regular supply into Mevagissey?—Yes.

22,247. And does the price remain about the same?—Yes.

22,248. Has there been a constant demand for your fish so as to enable you always to get rid of them?—Yes, we have been able to get rid of them all.

22,249. Then during that time your pilchards have been a large article of consumption here, and an important article for the food of the poor?—Yes, just as Mr. Jago said, there are thousands in the country who depend on the pilchards, and the masters of vessels will buy them by thousands to carry to different parts.

22,250. Then you do not look to an export market for the fish that you catch with the drift-nets?—Yes; sometimes, for instance, if we get as much as 300 or 400 hogsheads we export some.

22,251. That is when the supply of them very much exceeds the demand?—Yes.

22,252. Are there any houses for salting the fish here?—Yes, all our fishermen have houses here of their own for that purpose.

22,253. Have the drift-fishermen houses of their own?—Yes, and they salt in the cellars.

22,254. I suppose they go in companies?—No, each man has one of his own. The owner of each boat has a cellar and salt for curing his own fish.

22,255. Does not that operation require rather a large space for carrying it on?—No, a small cellar about 20 ft. long is sufficient.

22,256. The fishermen here must be very well off; every man has his boat and cellar for salting his own fish?—Well, their situation is better than perhaps it ever was before in their lives; at one time I know that these men could hardly obtain a living in Mevagissey.

22,257. (*Mr. Lefevre.*) Was that before the drift-boats became common?—Yes.

22,258. Were they hard up and obliged to go elsewhere?—Yes, but that is not the case now, owing to their sobriety and industry.

22,259. (*Professor Huxley.*) Are not the people engaged here at fishing now more sober than they were at one time?—Yes.

22,260. Fishing people are generally rather thirsty, are they not?—They used to be, but they are altered now for the better.

22,261. Is there any herring-fishing here?—Yes.

22,262. Have you ever been herring-fishing?—Yes.

22,263. Do the same men go herring-fishing as go pilchard-fishing?—Yes.

22,264. What time does the herring make its appearance here?—About October.

22,265. How long does it last?—Till January or February. They come here till the early part of February sometimes.

22,266. What condition are the fish in when they come? Are they full fish?—Yes, they are very full when they first come.

22,267. Full of milt and roe?—Yes.

22,268. When do you begin to find that they are spent fish, that they have become shotten?—Some time after Christmas we find them so; they are not good for much after Christmas.

22,269. Do you find full fish in January or February?—No, they are generally full fish at the commencement of the season.

22,270. Then you do not find any spawning fish here in the month of February?—No, scarcely any.

22,271. How many fleets of herring-nets are there here?—40 or 50. Almost all the drift-boats have herring-nets.

22,272. Then they have two sets of nets?—Yes.

22,273. Do the herring-nets cost them a great deal of money?—Yes, in proportion to the others.

22,274. Then is there a considerable capital invested here in herring-fishing?—Yes, fully 12,000*l.*; and then we have the mackerel-fishing as well.

22,275. How do you fish for mackerel here?—We drift for them in the same way.

22,276. And set your nets as in drift-fishing?—Yes, only the nets swim on the surface.

22,277. Do you practise shore-seining for mackerel?—Yes.

22,278. You do that with the shore seine; that is not like the pilchard seine?—No, the meshes are larger.

22,279. You haul them on shore, do you not?—No.

22,280. Do you use the net for circle-net fishing?—Yes.

22,281. Like pilchard fishing?—Yes, we go round the shoal; the mackerel equal in their flight the pilchards.

22,282. (*Mr. Lefevre.*) Is the coast not fit for drawing the nets?—There is no beach, and we do not like that plan; it mangles the fish and makes them in a terrible state.

22,283. (*Professor Huxley.*) How large is the mesh of your mackerel seine?—About $1\frac{1}{4}$ inches on the bar.

22,284. Do you mean from knot to knot?—Yes; there is just a little of that in the bunt where we take them out. If we did not have that they would mesh in the net, and we should not be able to get them on board.

22,285. Is it common for the drift-net fishermen here to have three sets of nets, namely, pilchard-nets, herring-nets, and mackerel-nets?—Yes, that is very common now.

22,286. It is common for men to have three complete sets of nets?—Yes.

22,287. What would be the cost of these nets?—300*l.* or 400*l.*, supposing that everything was new.

22,288. And one boat does for all the nets?—Yes.

22,289. Of course they are not decked boats?—They are partly decked.

22,290. They are half-decked with a kind of forecastle-deck?—Yes, and we have one or two mackerel boats decked.

22,291. Do you line for mackerel at all?—Sometimes, but that has gone out for several years. In my youthful days we used to catch some thousands of mackerel with the hook and line, but we have not done much in that way lately.

22,292. Is it not worth your while now?—We do not find it to be very much so.

22,293. Are there less mackerel than there were formerly?—I don't think so. They come along in heavy shoals at times, both mackerel and pilchards. I recollect in the year 1849 there was an abundance of mackerel. We could catch them almost on the

beach by putting our hands out and taking them up. There were hundreds of thousands here for years. In 1862 they were very plentiful.

22,294. In what condition are the pilchards when they come in, are they full fish?—No, they spawn before that, about May and June, off the Lizard. If we shoot the mackerel nets, then we find them in the mackerel nets. The mackerel nets will take them because they are full of roe.

22,295. Then do the pilchards as a rule spawn in May and June?—Yes.

22,296. Are the fish that come in here in shoals shotten fish?—Yes.

22,297. They are fat fish?—Yes.

22,298. Have they no visible roe or melt inside?—Occasionally we may see some, but it is rarely the case; they are cured well after that.

22,299. But they have not much roe or melt in them?—When they have any roe in them they will not save well. They are in that condition in the early part of May, down to the beginning of June, and then they are not so good.

22,300. You do not find them in shoals then?—Do you mean in the early part of May and the beginning of June?

22,301. Yes.—No, they are then in the Channel.

22,302. (*Mr. Lefevre.*) Are they always somewhere off the coast?—Yes, I think so.

22,303. (*Professor Huxley.*) Then they are very different from the herrings?—Yes.

22,304. When you get herrings here in great shoals they are mostly becoming full fish?—Yes.

22,305. Do you think that the trawlers do you any harm here?—We fancy that they injure the spawn outside.

22,306. Do they get foul of you?—Sometimes in the offing they will get foul of the mackerel-nets.

22,307. Do they get foul of the pilchard-nets?—No, not near our place; but if any of our men go off Plymouth and down that way they are very dangerous then. I have heard of boats being run down by them.

22,308. Have you known anybody who has been engaged in fishing off Mevagissey hurt by them?—No, not hereabouts.

22,309. What sort of lights do you carry on your pilchard boats?—We are supposed by law to carry the single light when the nets are out at anchor.

22,310. What lights do you carry when you are herring-fishing?—Then we carry a single light, a bright light.

22,311. Did you ever know anybody interfere with you about that?—No.

22,312. Do the Coastguard or the Revenue people interfere with you?—No.

22,313. What is the size of the mesh for your herring-net?—About one inch and a quarter.

22,314. How many to the yard?—32.

22,315. Do you make it of any size you like?—No, it would not do to have it either too large or too small.

22,316. You are guided by that and not by any law upon the subject?—Yes.

22,317. If you wished to make it 40 to the yard you would do so if you liked?—Yes.

22,318. Did you ever have any Government officer here to examine your nets?—Some years ago there were some persons who came down and overhauled the nets with regard to the salmon.

22,319. But not your drift-herring nets?—No.

22,320. Then nobody meddles with you at all?—No.

22,321. Did you ever hear of any regulation of this kind: "The meshes of all nets used for herring-"fishing shall not be less than one inch square from "knot to knot along the line?" Did you happen to know that you would be liable to be brought up before the magistrates for using meshes less than that?—Yes, I have heard of that.

22,322. Now, with regard to the injury done by the trawlers, did you ever hear of this regulation: "Trawl-boats shall always keep at a distance of at "least three miles from all boats fishing for herrings "or mackerel with drift-nets?" Did you ever hear of that?—No.

22,323. Did you ever hear of its being enforced by anybody?—No, I never did.

22,324. Did you ever hear of any complaint being made by the drift-fishermen of damage done to them, and of the trawlers being punished under this convention?—No, I never heard of their being punished. I have heard of the trawlers injuring the nets, but I have never heard of their being punished for it.

22,325. Let me ask you a question with regard to the lights. Article 53 says, "In order that boats "fishing with drift-nets may be easily recognized at "night, the masters of these boats shall hoist on one "of their masts two lights, one over the other, three "feet apart." Did anybody ever take the trouble to do that?—I have taken the trouble to do it a few times, but not very often.

22,326. Did anybody ever meddle with you for not doing it?—No, I was never interfered with by anybody.

22,327. Did you ever hear of anybody trying to enforce the provisions of this Act, or taking any trouble about it here?—No.

22,328–9. How are your herring-boats rigged here?—They are lug-rigged. With a mizen and foresail.

22,330. Do you strike your main-mast when you commence fishing?—Yes.

22,331. How high is the mizen?—Thirty feet.

22,332. Do you keep the mizen set?—Yes.

22,333. That is done in order to keep the boat steady, is it not?—Yes.

22,334. Where do you hoist the light?—They have an iron fixed into the gunwale, six feet above the gunwale.

22,335. Is there anything to prevent you from having a second light three feet under the first?—I do not see how we are to do it.

22,336. The regulation is that you shall hang the second light three feet lower down?—Yes.

22,337. Is there anything to prevent that?—It would be difficult to do it unless we had an iron especially for it.

22,338. The light is nothing but a lantern, is it?—No; but it would be rather a difficult thing to do.

22,339. How is a trawler to distinguish between a hand-line fishing boat and a drift-net fishing boat by night, when they both hoist the same light up?—I know nothing about that.

22,340. Now you are a pilot. Supposing that you had the management of a trawler at night, and that you saw a single light upon a vessel at some distance, how are you to know whether that is a hand-line boat or a drift-net boat?—I should not be able to know.

22,341. Then it would be no great fault of yours if you ran over the drift-net man's nets?—I should keep to leeward of them, under the lee side.

22,342. But suppose it was more convenient for you to go the windward; if you did not know that they were drift-net men, why should you not do so? If the drift-net men do not have the distinctive lights they are ordered to carry by this Act of Parliament, the trawling-men are not to be blamed for running over their nets?—There is no reason why the drift-net men should not carry the lights according to the Act of Parliament.

22,343. Would there be any particular difficulty in having the second light under the first?—No, I think not; there would not be much difficulty.

22,344. Then why should you not obey the Act as there is no difficulty about it?—No, there is no difficulty. Of course we could put up two lights; but we do carry a flare-up.

22,345. But that is not in accordance with the regulation laid down by Act of Parliament?—No.

22,346. And you think there would be no particular hardship in enforcing this regulation?—No, I think not.

22,347. Are you at all troubled with Frenchmen coming here fishing among you?—No.

MEVAGISSEY.

J. Ley.

29 Mar. 1864.

22,348. Do you have any heavy decked boats here from St. Ives?—The Brighton and Hastings boats come down sometimes.

22,349. They are decked boats?—Yes, and they have large fleets of mackerel-nets.

22,350. And herring-nets as well?—It is a rare thing to find them here with herring-nets.

22,351. (*Mr. Lefevre*). Do the Yarmouth boats come here as well?—Yes, they come here occasionally to the mackerel-fishing.

22,352. Do they come drifting among you?—Yes.

22,353–4. And you go among them?—Yes.

22,355. Did you ever hear of this law? "Whenever "decked herring boats and undecked herring boats "shall commence shooting their nets at the same "time, the undecked boats shall shoot their nets to "windward of the decked boats, except they should "prefer going to leeward to a distance of at least "half a mile to shoot their nets. The decked boats "on their part shall shoot their nets to leeward of "the undecked boats, unless they prefer going to "windward to a distance of at least half a mile to "shoot their nets." Did you ever hear of that?—I do not recollect hearing of it before.

22,356. Have you heard of this further regulation? "When decked boats shall arrive on grounds where "fishing is already begun by other boats, amongst "which shall be undecked boats, the decked boats so "arriving shall shoot their nets to leeward of the "undecked boats, except they should prefer going to "windward to a distance of at least half a mile to "shoot their nets. When undecked boats shall ar-"rive on grounds where fishing is already begun by "other boats, amongst which shall be decked boats, "the undecked boats so arriving shall shoot their "nets to windward of the decked boats, except they "prefer going to leeward to a distance of at least "half a mile to shoot their nets." Did you ever hear of that regulation?—No.

22,357. Then it appears that nobody pays any attention to them?—No.

22,358. Do you think that any particular harm arises from the decked boats fishing among the undecked boats?—I never knew any harm result from it.

22,359. Then you see no reason for this regulation?—No.

22,360. The boats never do each other any harm?—No.

22,361. When does the pilchard-fishing begin here?—About July.

22,362. Do you find then that the fish are a great distance from the coast?—Yes.

22,363. As the season advances do they come nearer?—Yes, they draw nearer the land.

22,364. Do you often set your nets within a league and a half of the coast?—Yes, the fish will draw to the land as the summer comes on. They come in as the prey comes towards the land. It is my opinion that the fish come towards the land as the season advances.

22,365. Do you catch half your fish within a league and a half of the coast?—Yes, I think so, and more than that too.

22,366. More than half?—Yes.

22,367. Within a league and a half of the coast?—Yes.

22,368. Did you ever hear of anybody being prosecuted for setting his nets within a league and a half of the coast?—Yes, many years ago some old men were put in prison for it.

22,369. There has been no interference of late years?—No, we have gone on very peaceably of late; but 14 or 15, or perhaps 18 or 20 years ago, I believe there was some interference.

22,370. What effect would it have on the fishing if this law were carried out, and the drift-men were not permitted to fish within a league and a half of the coast?—In that case the drift-men would not be able to get their bread.

22,371. Would it destroy the fishing here?—They would not get anything. It would be injurious to all parties. The seine-men would be unable to catch the fish, and the drift-men would be prevented from doing so, and the fishermen would not be able to get their bread in any other way.

22,372. If that law were carried into effect the drift-men would not be able to earn a living by their fishing?—No.

22,373. Do the herrings come to within a league and a half of the coast?—Yes, they come close into the shore; they come within a quarter of a mile and nearer than that.

22,374. Are you able to tell me what proportion of your catch of herrings is caught within a league and a half of the shore?—Some boats will catch 5,000 or 10,000, and some boats only 4,000 and 6,000, while others will only get 2,000 and 3,000. It varies very much.

22,375. What distance do you find them when they are first off this coast?—They generally come to within a short distance of us.

22,376. You do not go out any distance after them?—No, they come close in; sometimes they are within half a mile of the shore, sometimes within a quarter of a mile, and sometimes even nearer than that.

22,377. Then you catch nearly all your herrings within a league and a half of the shore?—Yes.

22,378. How is it with regard to the mackerel?—The mackerel are sometimes close in, and sometimes they are out in the bay.

22,379. Are they generally caught rather further off the shore than the herrings?—The mackerel drift-boats generally go further off, but sometimes the fish are in the shallow water. We catch an abundance of fish in the mackerel season; sometimes 10,000, 15,000, and as much as 20,000.

22,380. Are you yourself the owner of a drift-boat?—Yes.

22,381. I think you said that you had not been out for some time yourself?—No, I have not.

22,382. How many men have you on board your drift-boat?—From three to four; they vary.

22,383. And a boy besides?—Yes.

22,384. How do you divide the take; do you pay the men by shares?—Yes, they have a share of what they take.

22,385. How do you divide the shares?—The boat and craft get half, and the other half is divided among the men.

22,386. One half goes between the boat and nets?—Yes.

22,387. The nets get an equal share with the boat?—Yes; the men get half, and the remaining half goes to the boat, nets, and craft.

22,388. Do you find that you make as much now by your boat as when you bought it?—Yes.

22,389. You do not find that you have lost anything by it, or that you do not make as much by it?—No, I do very well every year.

The witness withdrew.

J. Elvins.

JOSEPH ELVINS called and examined.

22,390. (*Professor Huxley.*) You are a fisherman of this place?—Yes.

22,391. How long have you been fishing here?—For 40 years.

22,392. What mode of fishing have you practised?—I was seining for 20 years, and then I took to hook-fishing.

22,393. Do you agree with what we have heard as to the mode of practising seining?—Yes, I do not think I should be able to get a living out of it. It would not pay me at all. I was obliged to be hauling for other people the first part of my time, and then I left that and went with nets. During the time I was filling that position I caught thousands and tens of

thousands of small fish, which were sold for manure, in order that they might be put upon the land.

22,394. Do you mean small fish caught by the seine?—Yes.

22,395. What kind of seine? The tuck-seine?—No, the stop-seine.

22,396. Is that the seine with which the pilchards are caught?—Yes.

22,397. And you say that you have caught large numbers of small fish in that seine?—Yes, I have been selling tens of thousands of chads, small pilchards, and other things caught in the nets. I have been drawing them on to the pier for manure, and then they have been carted away to be put upon the land; but I found I could not get a living by that sort of work, and I was obliged to leave it.

22,398. How was that?—I could not get any pay. Sometimes I would get 2*l.* or 3*l.* for my share, but not enough to support my family.

22,399. Do not the great catches make up for the poor ones?—No.

22,400. And that was the reason why you left off seining?—Yes.

22,401. You also state that it is within your experience that a large quantity of small fish is taken in the stop-seines?—Yes.

22,402. What kind of fish?—Small pilchards, small chads, whitings, and other things.

22,403. I believe that the mesh of the pilchard-net is so small that it would confine every kind of small fish?—Yes.

22,404. What is the smallest fish you have seen taken up in the pilchard-nets?—I have seen little bits of small mackerel, very small indeed, about the length of my finger, and thousands of small chads. In point of fact every kind of fish you could mention.

22,405. Were there any small turbots among them?—Yes, small turbots, and every kind of flat-fish. We used to take immense numbers of small fish, tens of thousands.

22,406. Then, besides taking pilchards in the seines, you destroyed an immeuse quantity of small fish of other descriptions?—Yes, we destroyed thousands of fish of other kinds.

22,407. Was the proportion very large compared with the whole take, or was it after all only insignificant?—I do not understand what you mean.

22,408. When you had a take of fish of that description in the seine, I mean a quantity of small fish mixed up with the pilchards, did that form a large proportion to the whole take?—Yes, it did; there was a sight of them.

22,409. Were the proper-sized pilchards picked out from the rest and the remainder left as refuse?—I have sometimes seen 5,000 or 6,000 small fish put into one hogshead, while the fair-sized fish would only run 2,800 in a hogshead.

22,410. In fishing with the drift-net does the net itself pick your fish for you?—Yes, we only take proper-sized fishes then.

22,411. The small fish go through the net?—Yes.

22,412. Then, under these circumstances, do you consider that the mode of catching pilchards by the seine-nets is a destructive and wasteful mode of fishing?—Yes, the poor man cannot get at a good shoal to do any good for himself. I have seen a poor man have a small seine, and wish to fish with it, when those who own the large seines have turned him off the position, and have then shot round the shoal themselves.

22,413. Is there not some agreement about the places where the seines shall be used?—I believe there was a law made by our forefathers long ago, that a man should have a seine a certain length before he should be entitled to have a turn.

22,414. What is a turn?—The meaning of a turn is this: a man with a seine must go out and ride his turn for 24 hours. Without that he could not get a turn, and was not allowed to shoot at all.

22,415. Who was to prevent him from shooting?—The seine-owners, both masters and men. They are more powerful than he is, and would prevent him.

22,416. Would they prevent him in the teeth of the law?—Yes, they would.

22,417. After you gave up seining what did you do?—I went driving after that, and since then, thank God, I have been enabled to bring up my family, and to pay my way. I am now going to have a larger boat built. I paid 127*l.* some years ago for the one I have got, and now I am going to have a larger one for my sons.

22,418. Is the regulation in reference to having special stations for the seine-nets a matter of agreement among the men?—Yes.

22,419. Can anyone take any station he likes?—No, the small seines cannot hold a turn at all.

22,420. Suppose you went out and took up a station, and held it for 24 hours, could the long-seine men force you to take up yours?—Yes, our seines are not considered long enough to hold turns.

22,421. Must you have the seine a certain length before you can hold a turn?—No man can hold a turn unless he has a seine 230 fathoms long and 14 fathoms deep.

22,422–3. Upon what law is this regulation based?—I cannot tell. I think it is a very hard law, and so do many of the fishermen; but what it is derived from I cannot say. I believe it is a private law.

22,424. So that practically the poor man, or the man of small capital, is excluded from the seine-fishing?—Yes, they could not get on at all.

22,425. They could only be employed by others?—Yes, and they could not bring up a family with that.

22,426. When did you begin the drift-net fishing?—I began in 1824; that is the first year I went drifting. I was with Messrs. Fox's concern for several years.

22,427. Did you begin as a member of the crew?—I began as the owner of an old boat. It was given to me, that is the keel, for supporting my mother. I supported her through life after my father died, and I got on in that manner.

22,428. Did you find that drifting answered so well that you were able to get on by it?—Yes.

22,429. Since you have been able to practise drift-fishing on your own account it has been of great benefit to you?—Yes.

22,430. (*Mr. Lefevre.*) Have you kept any account of the money you have taken for a series of years?—No, my missus takes the money. She never puts it in a book, and perhaps when we have sometimes made a good catch she may have been a little hasty with it.

22,431. (*Professor Huxley.*) Have you been engaged in the herring-fishing as well as in the pilchard-fishing?—Yes, I have a small boat of my own.

22,432. You have been able to set up your own boat?—Yes.

22,433. And your own nets?—Yes.

22,434. Does that all come out of pilchards?—Yes. In the beginning of my time I had to pay a guinea a year for a net.

22,435. Have you been engaged in hooking as well?—Yes, I have been all my life engaged in fishing in one way or another. I never did a day's work on the land in my life.

22,436. What sort of fish do you catch?—Every sort of fish.

22,437. Congers?—Yes, and hake, and every other kind of fish calculated to take the hook. I catch them all.

22,438. Do you catch whitings?—Yes.

22,439. How long have you been hooking?—Perhaps I may have been at it on and off for 40 years.

22,440. (*Mr. Lefevre.*) Have you been hooking between the other seasons?—Yes.

22,441. (*Professor Huxley.*) Do you find that the supply of hooked fish has kept up? Do the hook-and-line fishermen get as many fish as they did formerly?—I do not think they do. The trawlers disturb

MEVAGISSEY.

J. Elvins.

29 Mar. 1864.

our hook-and-line fishing off the land. I do not think there are as many fish as there were 20 years ago. They began to fall off about that time.

22,442. What fish have fallen off most?—I think the mackerel, whiting, and hake.

22,443. Do you catch mackerel by hooking?—Yes.

22,444. And there has been a falling off in that?—Yes, and in hake too. There has been a great falling off in hake.

22,445. How has it been with regard to codfish?—The catch of cod varies very much.

22,446. Taking them on the average, are there not as many caught now as were caught formerly?—There were as many caught the year before last and last season as were ever known, but this year we have scarcely had any.

22,447. How has it been with regard to whiting?—They have been very scarce indeed. This year, if you were to offer me 50*l.* for one, I could not tell where to go and catch it.

22,448. Are the whitings apt to vary in the same way as cod?—I never knew a winter like this has been before. They seem to have gone right away from the coast.

22,449. What is the reason of that?—I cannot form any idea.

22,450. What is the nature of the bottom off here, is it rocky?—I am pretty well acquainted with the bottom off here. I do not think there is a man in the county who has had more experience than I have. From Port Looe the land runs up abreast of Fowey Harbour, and there is clean ground from there to Rame Head.

22,451. Is there trawling ground outside?—Yes.

22,452. How near do the trawlers come to the shore?—They come within four miles of the land, and I have seen them as far as 12 miles out.

22,453. From the Deadman?—Yes.

22,454. Where is the whiting ground?—It is where they trawl.

22,455. (*Mr. Lefevre.*) The trawlers do not come lower down than Looe, do they?—Yes, south of the Deadman. They passed me several times last year when I was fishing there.

22,456. (*Professor Huxley.*) Did they come within 10 miles of the Deadman?—Yes, and within five miles of it, and within four miles of the Gribben.

22,457. What sort of a haul of whiting did you have last year?—They did not come off the coast at all last year. I never knew anything like it in all my life. I have been off Falmouth Harbour and about Polperro looking for them, and have not succeeded in finding one.

22,458. What is the reason of that?—I cannot tell. I cannot give you any account of it. We catch an immense lot of those things we call bibs; we have been making a greater price for them than ever we did before, perhaps double as much.

22,459. Is that the whiting-pouting?—Yes, they live on small splats.

22,460. Have the bibs increased as much as the others have fallen off?—Yes, and they will go on increasing till we thin them out. They are things that you cannot catch everywhere. I have made a great price of them this winter. I believe that I have taken more than all the men about our coast.

22,461. How is that?—Because I have fished for them particularly, and I am better acquainted with them than other fishermen.

22,462. Are you able to say whether there is any regulation or law here that does you any harm?—I would not much mind what the laws were as long as every man was let to fish where he liked, and permitted to enjoy his own opinion. He ought to be allowed to fish where he pleases, whether he has a big seine or a little one. I think the laws should be fair, and that we should all act fairly one towards another.

24,463. You have no objection to seining?—No; every man ought to be allowed to get his living honestly where God has called him.

22,464. You want to be allowed to drift as much as you like?—Yes; I cannot get a living if I am to be kept a league and a half from the land, because my living is all within that. It is very seldom that I go five or six miles out in the summer time.

22,465. If that law were put in force, and you were obliged to haul up when you were drifting, if you found yourself within three miles of the land, do you think that it would inflict great damage upon you?—Yes.

22,466. Would the enforcing of that law practically put an end to drift-net fishing?—Yes, it would put an end to the whole of it throughout the county of Cornwall.

22,467. Do you agree with the previous witnesses that the pilchards which are caught by the drift-net fishermen are sold to hawkers and other persons who carry them about the country?—Yes.

22,468. Are you acquainted with the mode of living adopted by the agricultural people here?—Yes.

22,469. Do they depend to a considerable extent upon the pilchards for their food?—Yes, many of them will take 1,000 of them if they can raise them for their families. Many of them are glad to get 1,000 and upwards if they can.

22,470. I suppose that pilchards are much cheaper than butcher's meat?—Yes, you can get five salted pilchards for a penny now in Mevagissey. I sell them for that now. I have got some at home in salt which I sell to the neighbours around. I sell them at five a penny, or 2*s.* a hundred.

22,471. Do you recollect the bounty being taken off?—I cannot tell you much about that. I have heard reports of it, but I was a very young man at the time, and was engaged at seining with my father.

22,472. Are you able to say whether the people live more upon the pilchards now than they did then?—We had little cellars then, and we had a difficulty in getting salt. We used to tie the salt bags round the women's legs and smuggle it in.

22,473. (*Professor Huxley.*) Do the hook-fishermen have to go farther out to fish now than they did formerly?—No, I have been farther out before now. I have been in a very leaky boat even off the Lizard at night.

22,474. But on the average do the fishermen go farther out now?—No; in the hook-and-line fishery they do not go further out now than they did 40 years ago.

22,475. (*Mr. Lefevre.*) How many boats go from here hook-and-line fishing?—During certain parts of the year every one of the boats is engaged in the hook fishing. There would be as many as 70 about then.

22,476. As many as 70?—Yes, large and small.

22,477. What distance do they go?—Some only half a mile, and some will go 10, 15, or 20 miles. Some will be fishing in shallow water and some in deep water, many leagues from the others.

22,478. Do you work a mackerel-net?—Yes.

22,479. Have you found any falling off in the take of mackerel?—I have been catching great quantities of them at times, but I have never been doing much in that way since I had nets in my own possession.

22,480. Do you think that the fishing has fallen off generally?—Yes, it is slack with us now.

22,481. Do a great many more boats come after the mackerel from Yarmouth, Brighton, and Hastings than did formerly?—Sometimes. The mackerel do not come into the Channel as they did formerly.

22,482. But is it not a fact that there are a great many more boats fishing for mackerel now?—I think there are more here now than there used to be.

22,483. In former days do you recollect boats coming here to fish for mackerel from Yarmouth, Brighton, and Hastings?—Yes, they have come off here ever since I can recollect.

22,484. Do they land their fish here or at Plymouth?—Sometimes here, but generally at Plymouth.

If the wind is against them they put in here. The Mount's Bay men were in the habit of landing their fish here before the railway went further down. They used to bring them in here fresh. They could not conveniently get them into Plymouth.

22,485. Do they mostly bring them here now?—Yes, and they are carried away from here. They are worth from 17*s.* to 18*s.* per cwt.

22,486. Do you send them away by the train?—Yes; the last witness, Ley, sends away haddock and whiting.

22,487. Are they sold on the beach?—Yes; they bring them on to the quay and the best bidder gets the lot.

22,488. And the buyer sends them off to the train?—Yes.

The witness withdrew.

WILLIAM ROBERTS called and examined.

W. Roberts.

22,489. (*Professor Huxley.*) Are you a fisherman here?—Yes.

22,490. How long have you been occupied in that way?—I have not been employed on the water. I have been principally engaged on land. I take charge of the fish when they are landed.

22,491. What kind of fish?—Pilchards.

22,492. What mode of pilchard-fishing are you acquainted with?—Seine-fishing.

22,493. Have you been exclusively concerned in the seine-fishing?—Yes, and in no other.

22,494. You are not practically acquainted with the actual mode of fishing?—No, except from other quarters. I have received information from other people, but I know nothing of it myself.

22,495. Is it your business to take charge of the fish as soon as they are landed?—Yes.

22,496. For whom?—For Messrs. Fox of Falmouth, and on my own account.

22,497. Is there a drying-house here?—Yes.

22,498. What is the common mode observed as soon as the shoal of fish have been taken in the seine?—As soon as they are brought in they are taken away to the cellars and placed in salt.

22,499. Are they gutted before they are salted?—No.

22,500. Are they put in casks?—Yes, 30 days after.

22,501. Then what is the first step?—They are laid down; first a layer of fish, and then a layer of salt.

22,502. In the cellars?—Yes, till a pile of them is raised six, seven, or eight feet high.

22,503. What is the bottom of the cellar made of?—They are all wood, some of them are paved with tar and sand.

22,504. Is there any provision made for drainage?—Yes.

22,505. Will you explain what is the construction of one of these salting houses. In the first place how is the floor made?—It is made of wood.

22,506. How is the floor arranged in order to allow the drainage of the fish?—There is a little declivity.

22,507. Is there a gutter on one side?—Yes, which leads down into a pit.

22,508. Then how do you proceed in the first instance, do you put down a layer of salt?—Yes.

22,509. How thick?—Very slight indeed, we merely sprinkle it over the sand on the floor.

22,510. Is it bay salt that you use?—We get it from France and Liverpool principally.

22,511. Is it a coarse salt?—Yes.

22,512. Is it of a reddish colour?—It is grey principally. The Liverpool salt is rather white.

22,513. By whom is that operation performed?—By women.

22,514. How many do you employ?—We employ 20 steadily, and from 120 to 140 when heavily pressed.

22,515. You have extra hands when you have larger catches and are pressed?—Yes.

22,516. Do you employ a certain number of those women at weekly wages?—Yes, we make a bargain with 28 at 2*s.* 6*d.* a week to attend our service when required.

22,517. You do not give them regular wages?—No.

22,518. That is a kind of earnest money?—Yes.

22,519. What do you pay them when employed?—We give them 2*s.* per hogshead for what they cure.

22,520. Then if the take of fish fails they get nothing but their half-crown?—No, their services are not required in that case, but they get their half-a-crown.

22,521. They get that under any circumstances?—Yes, whether there are any fish or no fish.

22,522. Then their remuneration depends upon the take of fish?—Quite so.

22,523. Then it cannot be called a steady employment?—No, it is not.

22,524. Now describe how you dispose of the shoal of fish when it comes to you to be cured. I understood you to say that in the first place there is a layer of salt spread by these women over the floor?—Yes.

22,525. And then comes a layer of fish?—Yes.

22,526. Is there any particular mode of disposing of the fish? Are they laid head to tail?—No, I think not; the outside part they arrange, but they are not particular about the inside part.

22,527. How wide is the floor on which they are laid, is it as wide as this room?—Yes.

22,528. Is it wider?—Yes.

22,529. Do they walk over the floor and put them down in rows?—No, they keep a kind of passage down, and then they build another bulk against it till they cover the floor.

22,530. The second layer goes over the first?—Yes.

22,531. With the layer of salt between?—Yes.

22,532. And then comes a third layer of fish?—Yes, a third and a fourth.

22,533. How many layers will there be altogether?—I can hardly tell. They build them up to the height of four or five feet, or even higher than that.

22,534. Then there will be a great number of fish in these cellars?—Yes, a great number.

22,535. Then the pressure exercised upon the lower layers of fish must be considerable?—Yes.

22,536. What happens after they have been there for some time? Do the fish begin to yield, and give out juice?—Yes.

22,537. And that flows down your gutters?—Yes, into the pit.

22,538. What is it that flows down?—Oil and brine.

22,539. Do you collect the oil?—Yes

22,540. It comes to the top?—Yes.

22,541. And the brine goes to the bottom?—Yes.

22,542. What do you do with the oil?—We sell it at Bristol and London.

22,543. Do you know what is done with it in those places?—I believe it is used in connection with machinery, and by floor-cloth manufacturers.

22,544. Are you aware whether the oil comes from the livers of the fish?—No; I believe it comes from their bodies generally.

22,545. How long do the fish remain in that condition?—For 30 days.

22,546. Are they shifted at all during that time?—No.

22,547. At the end of that time are they cured?—Yes.

22,548. Does anything depend on the heat of the weather?—That does not appear to affect them.

MEVAGISSEY.

W. Roberts.

29 Mar. 1864.

22,549. Does the operation of laying the salt upon them require a little skill?—Yes, and the most experienced hands are employed.

22,550. If the work were carelessly done would not your fish run a great danger of rotting?—Yes.

22,551. Have you ever lost a considerable number of fish from carelessness?—No.

22,552. Would the people you employ be paid all the same if the fish turned out well or ill?—Yes, they would have just the same money.

22,553. Then each person does not get paid by the quantity of fish she cures, but the price paid for the total quantity is divided between them?—Yes.

22,554. It is taken for granted that they work equally?—Yes.

22,555. What happens after the fish have been laying in that state for 30 days; are they then transferred to casks?—They are then taken out and washed; the salt is removed from them; half of it comes back again.

22,556. Can it be employed again?—We do use it again sometimes, but we prefer disposing of it for manure.

22,557. What is done then?—After the fish are washed they are placed in casks, and put in the press.

22,558. In what kind of press?—In a press on the leverage principle.

22,559. What is the effect of that?—They gradually settle down in the cask. After three days they fill the cask again. After three more days they again refill it, and then the operation is completed.

22,560. Is it then headed up?—Yes.

22,561. Is there any Government inspection?—No.

22,562. There is nothing in the shape of the brand which is used with the herrings?—No, there is nothing of that kind; there was formerly.

22,563. When you had the bounty?—Yes.

22,564. But there is not at present?—No.

22,565. Do you not find that you are interfered with on the continent in consequence of the absence of the Government brand?—I cannot answer that question. It was before I had any knowledge of the matter that the brand existed. Of late years there has been no brand.

22,566. (*Mr. Lefevre.*) Has each pilchard merchant his separate trade mark?—Yes.

22,567. (*Professor Huxley.*) After the casks are headed up are the fishes exported?—Yes.

22,568. There is no considerable sale for them about the country in that state?—No, but occasionally we have sold them from the seines fresh.

22,569. Do not the drift-net fishermen supply a large proportion of the fish consumed in the country?—Yes, I believe they do.

22,570. In what relation does your house stand to the seines? Is there any agreement between the curing house and the seine workers, or do you have your own seines?—We have our own seines.

22,571. How many have you here?—We have 11 afloat now.

22,572. Do you engage the crews of the seines at the beginning of the season?—We bargain with them as we do with the women, and give them 1*s.* to secure their services.

22,573. And they are bound to come when you require their services?—Yes.

22,574. How many have you to one seine?—18.

22,575. Sixteen men and two boys?—Yes.

22,576. Out of that number how many will be sailors?—Some of them will be fishermen.

22,577. Fishermen by calling?—Men who know the sea.

22,578. How many?—I can scarcely say. We find a larger proportion in connection with one seine than with another.

22,579. I believe it is only necessary to have one or two men acquainted with the sea to manage the boats; the others may be shore-going men?—Yes, but the latter will have been engaged in this way for years.

22,580. Still a great number of them may be landsmen?—If we have a good set of men in the seine boat we are not so particular what they are in the follower.

22,581. That is the boat they call the volyer?—Yes.

22,582. A portion of the men will be sailors and fishermen, and the rest may be picked up anyhow?—Yes; carpenters, blacksmiths, and shoemakers, anybody that can be induced to go to sea.

22,583. Have you in your possession any records with regard to the take of fish of past years?—Yes.

22,584. Can you tell us what the average of hauls has been with your 11 seines during the season?—I hardly think I can give you that.

22,585. How many hauls will each seine have made?—That is a difficult matter to get at.

22,586. What number of hauls would constitute a good season?—As far as we are concerned we had a good season last year. There were four seines out with which Messrs. Fox are connected. Three are all their own, and Mr. Jago has an eighth share in the other one. Last year each seine produced 230 hogsheads at 55*s.* a hogshead.

22,587. How many times during the season will you get a good haul?—Perhaps only once sometimes, and sometimes twice; occasionally three times, but very rarely more.

22,588. Very rarely more than three times?—Yes.

22,589–90. Then out of your 11 nets do you think that you do well if you get 30 hauls in a season?—Yes; there is no more labour in enclosing a shoal worth 1,500*l.* than there is in enclosing one worth 30*s.*

22,591. How many nets has your firm got altogether?—11. I manage four out of the 11.

22,592. If each seine got three good hauls in the season you would think that you did well?—Yes, that would do very well for us.

22,593. I believe that a regular look-out for the fish is kept?—Yes, by the master seiners from the water, and by others from the hills.

22,594. What do the men do in the intervals when they are not employed with the seine? I presume that by taking the 1*s.* they are bound to give their services whenever they are called upon?—Yes, either day or night.

22,595. Then what do they do in the interval?—In the morning some of them may go harvesting, some shoemaking, some blacksmithing, some one thing and some another, and some of them are looking after the seines. They require washing, and otherwise attending to.

22,596. Is it the duty of the men who are hired in that way to attend to the seines as well as to work them when they are required?—Yes.

22,597. Suppose that you had no haul in the season then these men would get nothing at all?—No.

22,598. Notwithstanding they have engaged to tend the nets?—They get 8*s.* per week for their services, and their employment is only for about half the day. They go out after their dinners, and they get back about 8 or 10 o'clock, unless they find a shoal and shoot the nets, and in that case their services may be required in landing the fish if it happens to be a large catch for a week or ten days.

22,599. Then the men differ from the women in having regular wages?—Yes, and they have the fourth part of the fish besides.

22,600. Taking men, women, and children all together, how many people get employment in an average season in connection with your house and the four nets you manage?—I myself keep about 90 or 100 employed, men and women.

22,601. What the men actually get and what the women get must be a matter of great speculation?—Yes.

22,602. Some years they get a great deal?—Yes.

22,603. And some years next to nothing?—Yes.

22,604. In point of fact hardly enough to keep them alive?—It varies much. One of our seines

last year in the course of three or four days got from 15*l.* to 16*l.* a man.

22,605. That is what the poor men got, the men employed in working the seine ?—Yes.

22,606. Do you agree with what other witnesses have stated that employment in connexion with the seines is not so steady and regular as employment in connexion with the drift-nets ?—I think it is as far as wages go.

22,607. But the wages are small, only 8*s.* a-week ?—You must remember that the men are only employed half the day for that.

22,608. But the engagement is one which necessarily prevents a man who undertakes it from having other employment ?—They can get employment about the town. We do not like them to go into the country, because the fish might appear in their absence and then we should be short of hands.

22,609. It tends to keep the people engaged in this business rather idle than otherwise while the fish are off the coast ?—Yes.

22,610. The great mass of your fish are exported ?—Yes, the principal part.

22,611. Unless you get an unusually large catch ?—In that case they are all exported or nearly so.

22,612. You do not do much business with the hawkers about the country ?—Very little now.

22,613. Have you ever done much ?—Yes, formerly, and also with the drift-fishermen at Plymouth. We sold fish to them 15 or 16 years ago for one or two seasons, but I do not know what the quantity was. One seine sold 300*l.* worth in one year.

22,614. What is the greatest value of a shoal inclosed within a seine you have ever seen ; what money has it produced ?—I cannot exactly say. We had one last year that brought in 1,100*l.* and we had one a few months ago that brought in between 1,200*l.* and 1,300*l.*

22,615. Was that in one shoal ?—Yes.

22,616. Do you think the seining is injured by the drift-net fishing ?—There are various opinions respecting that.

22,617. What is your own opinion ?—I am not sufficiently a practical man to be enabled to give an opinion in the matter. I know very little about it, but I understand that it is considered injurious.

22,618. (*Mr. Lefevre.*) Do you remember when the number of drift-boats here was much smaller than it is now ?—Yes.

22,619. (*Professor Huxley.*) You have not made any observations on the matter yourself ?—No.

22,620. You cannot tell me from practical experience whether drifting breaks the shoal ?—It has been reported to me that it does.

22,621. Is it their theory of the case, or have they observed it ?—I think it is only their theory.

22,622. Do you know of anybody who has observed that drifting has actually broken the shoal ?—I do not know that I do ; I know very little about the matter.

22,623. You stated just now that the refuse salt after the fish have been washed was sold for manure ?—Yes.

22,624. Does it make good manure ?—Yes, we sell great quantities of it; we sell 200 tons or 300 tons in the course of the season.

22,625. One of the witnesses stated just now that when a large haul took place there was a great deal of refuse, consisting of small fish of no value ?—That is quite incorrect. During the last season I had 1,620 hogsheads in Messrs. Fox's cellars, and there were only 16 hogsheads of small fish among them.

22,626. But were all the fish brought to the cellars ?—I am speaking of the fish placed under my charge during the past season, and I had only 16 hogsheads of small fish out of 1,621.

22,627. Had a selection previously taken place ?—Yes, and 16 hogsheads of small fish came from the whole quantity.

22,628. Then you do not agree that there are a great number of small fish which are not pilchards and which are taken in the seines ?—Sometimes I have seen such a thing, but it is very rare when we have a large haul of fish. Our fish are very clean generally.

22,629. (*Mr. Lefevre.*) Are they much of the same size ?—Yes.

22,630. (*Professor Huxley.*) Have you ever seen any large quantity of useless fish disposed of for manure ?—Never in my day. It may have occurred in former times, owing to an immense quantity of fish being taken and there being a scarcity of salt, but nothing of the sort has ever come under my own knowledge.

22,631. Nothing of that kind has ever occurred within your own knowledge of Messrs. Fox's operations ?—No.

(*Mr. Jago.*) Perhaps I may be permitted to say that I have seen them sold in that way when they were not worth salting, they were so small. The Italian market requires very good fish. I remember a seine taking 270 hogsheads which were considered not worth salting after they were brought ashore, and they were carted away as manure.

22,632. (*Mr. Lefevre.*) Then it does happen sometimes that you get a shoal of useless fish ?—Yes.

22,633. (*Professor Huxley to the witness Roberts.*) Have you any difficulty now in obtaining salt ?—No, we can get any quantity we like.

22,634. In your opinion is there any regulation enforced which interferes with the prosperity of seine-fishing ?—No, I do not know that there is, but it is a difficult matter to enter into.

22,635. We are here for the express purpose of ascertaining that fact. One of our main duties is to inquire whether there is anything that interferes with the prosperity of any kind of fishing ; we are quite unpartial in the matter and only wish to obtain all the information we can. Is there anything you can suggest to us in addition to what you have already said ?—No, I think not. There is one thing I cannot account for.

22,636. What is that ?—Some seasons we have an abundance of fish and then we have not. We had them in 1849 in great abundance, then again in 1856, and again in 1863. It would appear from that that they come in great abundance once in every seven years.

22,637. In the years you have mentioned, namely 1849, 1856, and 1863, was there the same amount of drift-net fishing going on ?—Yes. I suppose the number has increased since 1849 ; but when we have had large catches in the seines they have also had large catches in the drift-nets ; when there has been a failure in the one there has also been a failure in the other. Both seem to derive advantage when the fish approach the shore.

22,638. Then the tendency of that answer is to show that drift-net fishing does not interfere with the seine-nets ?—I think the seine-nets would have a better chance if the drift-boats kept a little further off.

22,639. Would you keep them out a league and a half ?—No ; I would not wish to drive them to the extreme limit laid down by the law, but if they gave us a little fair play it would be rather beneficial to all parties. At Gorran, for instance, they must keep a little further off. There is a bay shore there where the seines can work better than at Mevagissey. The drift-net men would not be injured by that.

22,640. The drift-net men might if they pleased intercept the shoal ?—Yes.

22,641. It would be wrong for them to do so ?—Yes.

22,642. Does it ever occur ?—I cannot say; I have heard the master seiners say that when they have shot to enclose a shoal of fish, another shoal has come in and struck the side of the seine and the fish have immediately taken off into deep water. While they have been working the shoal another shoal has occasionally come up and struck the side of the seine. When such a case occurs the fish invariably take off.

MEVAGISSEY.

W. Roberts.

29 Mar. 1864.

22,643. Are you acquainted with the regulations which affect the seines? We have heard of persons taking possession of particular localities, and of there being some rule upon the matter.—Yes, there is a rule.

22,644. What is the nature of that rule?—They hold the turn for 24 hours.

22,645. What do they call that operation?—Stemming. They adopt that at St. Ives, and in the mackerel-fishing as well.

22,646. What is the rule as to that?—If a seiner takes possession of a given spot he shall hold it for a given time?—He is allowed to hold it unmolested for 24 hours.

22,647. He cannot be meddled with at all for 24 hours?—No.

22,648. Does the size of the seine regulate that privilege?—The seines are all of one length.

22,649. What is the length?—240 or 250 fathoms. No arrangement is entered into between one seine and another.

22,650. Is it regulated by a local Act of Parliament?—No.

22,651. Is there no Act of Parliament upon the subject?—Not here; I think there is one at other places.

22,652. If any person chooses to disregard that regulation, is there any means of enforcing it?—Yes, they have a right to interfere with each other.

22,653. Under what Act?—There is no Act.

22,654. Then where does the right come from?—It is a rule or regulation entered into between them, one with another.

22,655. Suppose that some outsider does not choose to come within the rule, have those who have laid down the law any right to enforce it?—I cannot say whether they have or not.

22,656. Have you ever seen any person taken before the magistrates for refusing to comply with this regulation?—I cannot say that I ever have.

29,657. (*Mr. Lefevre.*) How many of these turns are there?—About a dozen on our shore.

22,658. And there are only 11 seine-nets?—Yes, but there were only the same dozen turns when we had 40 seines. They were obliged then to take first, second, and third turns.

22,659. There is room now for all the seines?—Yes; each might have a separate turn if they liked.

22,660. (*Professor Huxley.*) Are these turns quiet, sheltered places where the seines can be worked?—Yes.

22,661. Does it depend on a man's activity whether he gets the first turn or not?—Perhaps two individuals may row for the same turn sometimes, and the first who gets there has it.

22,662. Is there anything like a roster or rotation set up?—No; some go to one place and some to another.

22,663. What is the distance between the stations?—I suppose they extend over two miles altogether.

22,664. If a man has held the turn for 24 hours, can he at the end of that time go on for another 24 hours?—Yes, if there is nobody to interrupt him.

22,665. But suppose another boat comes up and they say they want to fish there?—Then the first must go out, but he can renew the turn in 24 hours.

22,666. What is the rule in a difficulty of this kind: if two people come up after a man has held a turn for 24 hours, what is the rule in this case?—The last there goes back again.

22,667. (*Mr. Lefevre.*) How is it that a boat takes possession?—A man comes up with his boats and throws a barrel overboard with a rope attached to it.

22,668. Does he leave his nets in the boat until the shoal appears?—Yes.

22,669. (*Professor Huxley.*) And he may hold that turn for 24 hours?—Yes.

22,670. And if anybody else comes he must then go?—Yes, for instance, a man may row up and say, "Joe" or "Tom," as the case may be, "your turn is "up," and if that is the case the man immediately withdraws and the other takes his place.

22,671. (*Mr. Lefevre.*) I suppose there is not much choice in the stations, except with regard to their distance from the port?—Some seem to be favourable to one place and some to another.

22,672. (*Professor Huxley.*) We have heard it said that unless a man has a net of a certain size he is not allowed to claim the privilege of claiming a turn?—Yes, that is so. Those nets you refer to have been prevented from fishing since that byelaw was made, namely, within the last four or five years.

22,673. All this is a matter of local agreement for which there is no other warrant?—Yes.

22,674. (*Mr. Lefevre.*) Did I understand you to say that you had some seine-nets at Gorran?—No, we have only an eighth part in one seine there.

22,675. How many seines are there there?—There are three there now.

22,676. How far is that from here?—A couple of miles.

22,677. What place is there eastward from here where there are any seines?—Charlestown.

22,678. Are there any drift-boats at Gorran?—I think there are nine.

22,679. Between Gorran and Falmouth is there any fishing station?—There is one at Porthloe.

22,680. Are there any seine-nets there?—Three, I think.

22,681. Do you cure any fish for the drift-boats?—No; at Porthscathe there are a couple of seines. Then we get down to Falmouth harbour, and there are some at St. Mawes.

22,682. What is the greatest distance you have known the seine-nets put out from the shore?—They cannot go out a great distance their depth being only 14 fathoms. They are confined to a limited distance from the shore.

22,683. What is the greatest distance; is it half a mile?—From a quarter to half a mile, I suppose.

22,684. (*Professor Huxley.*) Can you give us any correct statistics of the catches here?—Yes, I will forward them to the secretary.

The witness withdrew.

J. Furze.

JOHN FURZE called and examined.

22,685-6. (*Professor Huxley.*) Are you able to explain to us what a ground-seine is?—Yes. It is a seine about 100 fathoms long and eight fathoms deep.

22,687. How is it made; is it made with a pocket?—No.

22,688. What size is the mesh?—From one and a quarter to one inch bar.

22,689. That is from knot to knot?—Yes.

22,690. Is it loaded along the foot?—Yes.

22,691. With what?—With lead.

22,692. Are there buoys along the head-line?—There are floats along the cork-lines.

22,693. How do you work the seine?—We shoot it similar to other seines.

22,694. Do you drag it on the shore?—No, we tuck it.

22,695. How many boats does it take to work it?—Two boats.

22,696. How many men are there in each boat?—Five.

22,697. Does it differ from the other seines?—We take up the tuck, and then we take the fish out of the tuck.

22,698. Is the middle of the net deep and long?—The middle of it is of the same depth.

22,699. When you haul it in you get hold of the bunt by the lower part?—Yes.

MEVAGISSEY.

J. Furze.

29 Mar. 1864.

22,700. What do you catch with the ground-seine?—Turbot, plaice, sole, brill, and other fish.

22,701. What depth of water do you work it in?—From four to eight fathoms.

22,702. Then you use it along the shore?—Yes.

22,703. Do you require any particular sort of bottom on which to fish?—It must be a soft bottom.

22,704. It will not do to use it on a rocky bottom?—If we use it near the rocks in the night time it will take the red mullet.

22,705. Do you catch turbot here in great numbers with it?—Last year we caught more than we ever did before, but they were not very large.

22,706. Do you catch soles as well?—We catch more in the summer, in June and July.

22,707. Are there any particular parts of the coast where you can use the ground-seines more than others?—Yes, off the Deadman Point and Gorran Bay.

22,708. In sandy places?—Yes.

22,709. (*Mr. Lefevre.*) Can you use it all the year round?—No, only from June and July to November.

22,710. (*Professor Huxley.*) Why can you not use it at other times?—Because the fish are not then near the shore.

22,711. Do you ever get any large turbots in that way?—We get them weighing from 10 lbs. up to 24 lbs.

22,712. Do you get plenty of soles?—Yes.

22,713. Do you catch plenty of small fish in the ground-seine?—Yes, in some seasons of the year.

22,714. What is the size of the smallest that you get?—We have soles from six to eight or 10 inches long.

22,715. Not smaller than that?—No.

22,716. Do you not get small turbot sometimes?—We get a few small ones if they come close in-shore. Last season we got the largest plaice we ever caught, from one to two feet in length.

22,717. (*Mr. Lefevre.*) What do you do with these small fish?—Sometimes we throw them away, and sometimes we bring them ashore.

22,718. Do you find any market for them?—Yes, we sell the large ones.

22,719. (*Professor Huxley.*) Where is your market for them?—Here.

22,720. Do you work that seine all the season?—Yes; and in November we use it for the herring-fishing.

22,721. When the herrings come in you look out for the shoals and surround them?—We go out and we shoot for them, but we do not do much in that way.

22,722. Is it a kind of circle-net fishing for herrings?—Yes.

22,723. Do you get large hauls?—Sometimes.

22,724. Are the herrings much damaged or bruised when they are taken in that way?—No, I cannot say that they are.

22,725. Why do you not practise the regular mode here; is it because you find the other mode better?—Yes.

22,726. Is there less chance about it?—Yes.

22,727. Are there many of these ground-seines here at Mevagissey?—I think there are four or five.

22,728. Do they keep their crews pretty well engaged?—In the season when the fish are off the coast they have crews to work them.

22,729. Are they regular fishermen?—No, boys and landsmen, whoever we can get to go.

22,730. (*Mr. Lefevre.*) How long has that system of fishing been carried on here?—From before my time.

22,731. Then it is not a new thing?—No.

22,732. (*Professor Huxley.*) Do you go hooking during the rest of the season?—No, I construct seines for others. I came from Charlestown this morning. I have been engaged there constructing pilchard-seines.

22,733. Do others who work their ground-seines go hooking or pilchard-fishing for the rest of the year?—They all go pilchard-fishing.

22,734. Then this is a different kind of fishing?—Yes.

22,735. Do you find any falling off in the quantity of fish you take by it?—Last year there were more fish on the ground than I ever saw before.

22,736. Does anybody trouble you or meddle with you?—No.

22,737. (*Mr. Lefevre.*) The trawlers have not affected that kind of fishing?—No, it is in-shore fishing and they cannot come.

22,738. Does the better class of fish you catch go off by train?—Yes.

22,739. Do you sell them on the beach?—Mr. Ley buys them.

22,740. What becomes of the inferior kind of fish?—It is sold round the country, such as chads, gurnards, and the like of that.

22,741. When you haul the nets in do you bring up the fish dead or alive?—They are all alive.

22,742. Do you throw any of them overboard?—Yes, if they are very small.

22,743. Are those you throw overboard alive?—Yes, they are all alive; they are not like those taken by the trawler men.

22,744. Have you trawled from here?—Yes.

22,745. There is a small trawler off here?—Yes.

22,746. Is that your boat?—No.

22,747. (*Professor Huxley.*) Have you seen dead fish brought up by the trawl?—Yes, I have seen fish got up dead in the trawl.

22,748. Have you been much engaged in trawling?—About 10 or 12 years.

22,749. (*Mr. Lefevre.*) From here or from Plymouth?—From here. I went first in the year 1826.

22,750. (*Professor Huxley.*) Why do not your fishermen here trawl more from this port?—They do not find that it answers.

22,751. What is the reason of that?—The fish they get in that way does not pay them so well as what they get by driving.

22,752. What sort of port have you here; can you get in and out at any state of the tide?—No.

22,753. You cannot use heavy vessels then?—No heavy vessels could get into this place.

22,754. (*Mr. Lefevre.*) Is the ground here suitable for trawling?—There is good trawling ground four or five miles off. You get then on the ground where the Plymouth men go.

22,755. Do you think trawling would pay you if you had a better port?—No.

22,756. Is there any further suggestion that you wish to make to us?—No.

The witness withdrew.

JOHN BEER called and examined.

J. Beer.

22,757. (*Professor Huxley.*) Do you belong to Gorran?—Yes.

22,758. How long have you been a fisherman there?—30 years.

22,759. What kind of fishing have you practised?—Crabbing, ground-seining, driving, and pilchard-seining.

22,760. Is Gorran a great crabbing place?—Yes, very great.

22,761. What is the reason of that? Is it a favourable spot about there for crabs?—Yes, very much so.

22,762. Is it rocky ground?—It is not all rocks; there is some sandy bottom.

22,763. How many fishermen are there in Gorran?—I suppose there are about 40 established fishermen.

22,764. Forty regular fishermen?—Yes.

22,765. How many boats have they among them?—20 small boats.

22,766. Crabbing boats?—Yes.

22,767. Are they all little wherries?—Yes.

22,768. How many other boats are there?—There are nine driving boats.

MEVAGISSEY.

J. Beer.

29 Mar. 1864.

22,769. Are they the same sort of driving boats as those here?—Yes.

22,770. What are the crabbing boats worth; they do not cost much, I suppose?—From 10*l.* to 14*l.*

22,771. Are they sailing boats?—Sailing and rowing boats.

22,772. How do you catch your crabs there, with pots?—Yes.

22,773. Do you bait your pots?—Yes.

22,774. What with?—Any kind of fish we can get.

22,775. Do the crabs like the bait high or fresh?—Fresh.

22,776. They prefer it fresh?—Yes; we cannot catch them at all if we have stale bait.

22,777–8. Do you catch lobsters with the bait stale or fresh?—It does not make any difference.

22,779. Do you set your pots on the rocks?—Yes, and on the sand as well. We set them on the rocks for the lobsters, and on the sand for the crabs.

22,780. Do you get a great supply?—Some seasons we get a very good supply, and in others the fish are very slight.

22,781. Taking it on the average, has there been any change of late years?—It has rather fallen off.

22,782. How many crab pots have you got here?—They average about 60.

22,783. (*Mr. Lefevre.*) 60 to each boat, or altogether?—60 on the average, some may have more or less.

22,784. (*Professor Huxley.*) Are they all made fast to one warp?—They are all separate but attached to one line.

22,785. Do you put them down and leave them?—Yes, we haul them in every 24 hours.

22,786. What is your average catch of crabs in that way? How many will a boat give? What is a good haul?—What we call a good haul now-a-days is half a score.

22,787. Is that half-a-score for 60 pots?—Yes.

22,788. Do you get one large crab for every six pots?—Yes, and when the she-fish come they are more plentiful. These are the large he-fish. I am speaking of the he-crabs. When we have the she-crabs here we catch some days perhaps 100.

22,789. Do the he-fish command a better price than the she fish?—Oh yes.

22,790. Where are they sold principally?—We sell them greatly to the smacks that trade with us.

22,791. Where do they carry their crabs?—To London and Southampton, I believe.

22,792. How many smacks trade at Gorran?—I can hardly say; there are eight or nine that go there, but three smacks would be sufficient to trade regularly.

22,793. Does that fishing go on all the year round?—No.

22,794. How many months in the year?—It commences in January and falls off when the pilchard season sets in in July.

22,795. You do not think that there has been any great decrease of late years?—There has been a decrease in the crabs.

22,796. Has the decrease been very great?—Yes.

22,797. What do you think is the reason of that?—I cannot assign any reason whatever for it.

22,798. Do you think that you have been fishing them too much?—I think that is the cause more than any other thing.

22,799. What do you do with the small crabs you catch?—We have a measure for them; if they come under that measure we throw them away.

22,800. You throw them away if they are under a certain size?—Yes.

22,801. What is the smallest size at which you take them?—Six inches for a he-fish.

22,802. And what for a she-fish?—There is no rule for the she-fish.

22,803. (*Mr. Lefevre.*) Has the number of crab-boats increased?—They are just about the same some years; they decrease, and then they increase again. I think this year there has been an increase.

22,804. (*ProfessorHuxley.*) How long has that rule concerning the size of the he and she fish been laid down?—Ever since I have been crab-fishing.

22,805. Is it a kind of agreement among the fishermen?—Yes.

22,806. I suppose it would not do much good unless you were to put down the he as well as the she fish?—If we find a fish with berries we cast them away always.

22,807. What do you do with the berry lobster?—We sell all we get.

22,808. Do you not get rather a higher price for them?—No, only the same price: we sell them at so much per dozen.

22,809. Have the lobsters fallen off too?—Yes, very much so indeed; we were about to make an agreement among ourselves to abstain from fishing in the fall of the year. We consider that the lobsters come to the coast at that time to spawn, and we tried to make an agreement to put a stop to the fishing then; we think it is injurious. In the summer season the fish begin to draw in to the land, the lobsters get almost as near as there is any water for them and there they cast their spawn. We find more berries then than at any other time of the year.

22,810. What do you mean by saying that the lobsters cast their spawn; they carry it with them, do they not?—Yes, they carry it with them till it gets ripe, and then it falls off.

22,811. You think that the eggs are detached in shallow water?—Yes, we consider that that is so when the weather is warm and the water still.

22,812. What is the smallest-sized lobster you have ever caught?—About the length of your pen.

22,813. Not smaller than that?—We do not make our pots sufficiently close to catch them smaller than that. We could make them close enough to enable us to catch them half that size, but we find that such fish would be of no benefit to us. We therefore make our lobster pots of certain dimensions, so that the smaller fish may pass through.

22,814. By chance did you ever see a lobster half the size of the smallest you generally take?—No.

22,815. If there are any such your pots would not bring them up?—No.

22,816. (*Mr. Lefevre.*) They would get out again?—Yes.

22,817. Do you sell lobsters of that length?—Yes.

22,818. Do they sell very well?—They are generally counted two for one.

22,819. (*Professor Huxley.*) Are your lobster pots made in the same fashion as your crab pots?—Yes.

22,820. How many of them do you have to each boat?—50 to each boat.

22,821. Do you use the same pots?—Yes, we use the same for crabs and for lobsters.

22,822. Do you think that the scarcity of lobsters has arisen from over-fishing?—I am not prepared to express an opinion on that point.

22,823. But you tell us that you thought of making some regulation among you?—Yes; it was mentioned among ourselves the other day when we heard that you were coming down.

22,824. Could you not agree in the matter?—No, it is not often that you find all of one mind.

22,825. What other kind of fishing is there at Gorrin?—There is a pilchard fishery.

22,826. Do you agree with what has been stated by previous witnesses in reference to the pilchard-fishing?—Yes.

22,827. Is there any seining at Gorran?—Yes, I have a small seine myself.

22,828. (*Mr. Lefevre.*) Is it a ground-seine or a small pilchard-seine?—I have a ground-seine also.

22,829. (*Professor Huxley.*) Have you a small pilchard-seine?—Yes.

22,830. Have you any rule about stations there?—The rule is that the stems are only for the large seines. They will not allow me to go there on any terms whatever.

22,831. Who will not allow you to go there?—The lot of them, beginning with the masters and going down to the young ones.

22,832. Have you ever gone to a station to take up your place and then been ordered off?—Yes, and they threatened to run me down too.

22,833. By what law or authority was that done?—I do not think they have any law or authority. It was done by nothing more than an overruling power as we call it. Now I am a fisherman the same as my friends here who have spoken before. I have been a fisherman engaged at that employment from the time I was 12 years of age, and I never earned 1*s.* from anybody on land in my life. I have been in what you may call the very lowest grade of fishing, and that is what we call crabbing. Now I am a driver and a stop-seiner.

22,834. But why do you set up a stop-seine if you are not allowed to use it?—They will not let me use it, because they say it is a small one, and they say it is under size.

22,835. If the people order you away when you try to use it, surely it can be of no use to you?—No, it is of no great use.

22,836. Did you not know that they would not allow you to use it when you bought it?—No.

22,837. How many years have you had it?—Only one. Last year was the first time I tried to use it.

22,838. Under these circumstances did you not attempt to get some protection?—I got no protection at all. I wanted to make some arrangement with the masters and workers. I told the men in charge of the large seines that I was ready to meet them on any reasonable terms. I offered to go to the masters, or to the magistrates, or I was willing to appeal to the law. I did not wish to have any disturbance; all I wanted was to have the matter settled in a proper manner. We are only poor fishermen, and it is a matter of great importance to us. There are four of us acting in company, and we endeavoured to set up this small seine, yet after we got it they would not allow us to use it. I tried to meet them on any reasonable terms, but they would not allow us to come in at all. We have turns here on the west side of the Deadman, and we have turns also on the east side. I said to them, Now suppose you stem on the east side of the Deadman, and suppose I am inclined to stem on the west side, we can very easily arrange that, or if you choose to stem up here I can go somewhere else. I will go there to the east side of the Deadman, or to the west, or where you please, but it is very hard not to allow me to fish at all. All I want to know is, if I go away from you, will you allow me to work my little seine where there is water. The complaint they had against me was that my seine was only nine fathoms deep, whereas theirs was 11 and 12 fathoms deep. I said I will go outside yours if you will not allow me the privilege of working inside. They told me that if I went to the west side, or went to the east, I should not be allowed to shoot my seine, but I should be ordered out of the turn. What was I to do under these circumstances? They said I was to go away from them. I said further west at Porthloe I shall be ordered away there, and what am I to do betwixt the two fires. All they said was you must do your best.

22,839. (*Mr. Lefevre.*) What turns are there at Gorran?—There are three turns near the place, and eight or nine further down.

22,840. And there are only three seines there?—Only three.

22,841. Then there is room for plenty more seines?—Yes, there is plenty of room.

22,842. (*Professor Huxley.*) What is the ground of the objection to your seine; I suppose there must be some sort of reasonable objection made?—I do not know, I am sure. I do not know anything about it. I have no idea what objection there can be.

22,843. Was it that the long seines expected to be cut out?—I do not see how they could be. I told them plainly before I went out that I would meet them on any reasonable terms. I went to an influential man to make an arrangement, but he told me I must go further as he was an interested party.

22,844. (*Mr. Lefevre.*) I understood you to say that you offered the large-seine men the choice of stations?—Yes, we must hold the stem for 24 hours. Then after 24 hours it goes to the next man. I did not ask for a whole stem, but I simply requested to be allowed to work my seine if I was there before them. But they said no, they would not allow me to do so at all.

22,845. (*Professor Huxley.*) They with a deeper seine would have the advantage, and could work outside of you?—Yes.

22,846. (*Mr. Lefevre.*) Could you not wait and see what stem they took, and then take another?—Yes, but if they felt inclined they would come and turn me out.

22,847. If they saw the fish come in would they leave their own stem and come to yours?—Yes, if the fish happened to be in mine they would do so. I went to the west side of the Deadman early one morning. I went there first turn, and I went on shore to look out for the fish, and see if there was a shoal there. I was on a hill on the look-out, in the same way that we look out for mackerel, when one of the seine-boats came down. There was another stem in the inside turn from me, but they came down and hove out their grapnel just outside of me, notwithstanding that there was another turn vacant at the west side. They would not go further down because they wished to interrupt me.

22,848. (*Professor Huxley.*) How is it that you allowed all this to take place without appealing to the nearest authority? There must be some right or wrong in the matter?—I was given to understand that there was no law for it. We tried it on with the mackerel seines and we did no good; we found that the weakest must go to leeward.

22,849. So I understand you complain of this custom, and you cannot say it is sanctioned by law?—No, we are given to understand that there is no law for it whatever.

22,850. Then in that case there is nothing we can very well do to help you; you must have recourse to the ordinary forms of law?—We are entirely helpless. We are down, and there we must stop. What can we do?

22,851. I thought that the ordinary process of law would protect you?—I have tried to make things as agreeable as possible. I tried this morning before I came away. I told them I was ready to meet them on any reasonable terms, but I do think that it is very hard on me as a poor fisherman that I should not be allowed to go out and work my little seine.

22,852. Would it not be better for some of the fishermen who feel oppressed by this course of proceeding to ascertain definitely what the condition of the law is, so as to know whether there is any law that really affects or binds them?—We are only poor fishermen, and we do not understand much about the law. Therefore, when the thing was done, we allowed it to fall off.

22,853. (*Mr. Lefevre.*) But suppose that you insisted upon putting your seine-net down?—I was told that if I persisted in doing that they would run into me.

22,854. They threatened to run you down?—Yes.

22,855. But if they did that surely you could appeal to the law?—Of course we could appeal to the law then for damages.

22,856. In that case the question would be settled whether they had any right or not?—No doubt, if they went as far as that, we could appeal to the law for damages.

MEVAGISSEY.

J. Beer.

29 Mar. 1864.

22,857. What would be the effect of putting your net, which is only nine fathoms deep, in deeper water?—In that case we should lose all the fish. We should not attempt that.

22,858. How many men do you employ for your seine-net?—We have about nine hands, including the boys. We have two boys for each boat.

22,859. Did you not take any fish with your seine last year?—We got about four hogsheads.

22,860. That did not pay you?—No, it was very slight indeed.

22,861. What was the cost of your net?—50*l.*

22,862. How long does a seine-net last?—That depends upon the use you have for it. Generally speaking a net will last from 10 to 15 years; 15 years I should think.

22,863. Is the whole coast along here set out in stems?—Yes, wherever there is a sandy bottom and the seine can work.

22,864. Where there are rocks there are no stations?—No, it would be useless to have stations where there are rocks.

22,865. Is there a considerable quantity of rocky ground between here and Falmouth?—Yes, in places.

22,866. Is it only here and there that you find it clear?—Yes.

22,867. Is it your impression that the lobsters are destroyed by trawling?—For my own part I do not know anything about the matter, although I have been engaged in the fishing business all my life, and although I have used ground-seines and mackerel-seines, and also crab-pots. I am not prepared to say anything upon this matter.

22,868. Do the trawlers ever trawl over the crab-pots?—Yes.

22,869. Have you suffered damage from that?—Yes, I have suffered a great deal of damage.

22,870. That has been the ground of complaint among the fishermen here?—Yes, it has been; we consider that the crabbers are the prey of everyone.

22,871. I take it that that is one of the calculations of your trade?—Yes, we make that calculation.

22,872. The trawlers do not come within a short distance of Gorran, do they?—Yes.

22,873–4. (*Professor Huxley.*) Do you think they should be kept out of the bays where the crab-pots are set?—I have no desire to prevent them from getting a living, but we have suffered from them.

22,875. (*Mr. Lefevre.*) Have you got a drift-boat of your own?—Yes.

22,876. What did it cost you?—The boat cost about 70*l.*

22,877. And what did the nets cost?—About 60*l.*

22,878. Then you saved sufficient by that to purchase a seine-net?—I am like our friend at the back who gave his evidence a little while ago; I rose up from as low a position as I could have been in; I have managed to get along somehow; first I got a good ground-seine, and then a mackerel-seine, and then a drift-boat.

22,879. You have done pretty well, then, one way and another?—Yes, I have managed to bring up a large family in a decent way without being a burden upon anybody.

The witness withdrew.

J. Hunkin.

JOSIAH HUNKIN called and examined.

22,880. (*Professor Huxley.*) Are you a fisherman here?—I have been a fisherman from my boyhood; for a few years I attended to something else, but I always went fishing in the season.

22,881. What modes of fishing have you practised?—All sorts except trawling and crabbing.

22,882. You have heard the evidence given by the previous witnesses?—Yes.

22,883. Have you anything to add to their evidence, or anything to qualify?—I might say a great deal, but I think that perhaps enough has already been said upon the general subject. There is, however, one thing upon which I wish to say a word, and that is, the obstruction which is given to the small seines by the large pilchard-seines. As others have said already, I also have risen from one net to many nets of all sorts. Last season I put into the water what is deemed a little seine, and which has recently been called a jackass-seine.

22,884. What is the nature of the seine?—It is a small pilchard-seine, but that is only the appellation they give it.

22,285. A large one being called a horse-seine, I suppose?—Yes, perhaps so.

22,886. What is the size of your small seine?—It is 100 fathoms long and 12 fathoms deep.

22,887. Is it made with the same sized mesh as the large seine?—Yes, the mesh is just the same.

22,888. What is the cost of a net of that kind?—Last year I had a fathom of mackerel-net to the bottom of the seine, but now I have it all the same mesh.

22,889. I am not asking about the mesh, but I want to know what the cost of a seine such as that is?—I can hardly tell you exactly, but I suppose she would cost when new not much less than 100*l.*

22,890. Then we may take it that it requires a certain amount of disposable capital to set up a net of that kind?—Yes.

22,891. When did you set it up?—I never had one in the water till last season.

22,892. What happened when you tried to put it in action?—In the first place allow me to observe that I did not go with that seine only, I had a partner with a seine of the same dimensions; the two together made a seine of 200 fathoms in length.

22,893. What occurred the first time you shot the seine?—After we had shot we endeavoured to take up one of the seines, when a large pilchard-seine came to the turn.

22,894. Had you your turn in regular order?—There was no large seine there when we got there, we therefore shot our seine. When the large seine came up, almost the first thing they did was to ask if the seine had anything in her; I said no. One man on board the other boat said "We will heave the grapnel into her," but they did not do it.

22,895. Did they mean to throw it in your net?—Yes. I complained to them of their wanting to monopolize all the fishing.

22,896. Did they drive you from the ground?—No, our seine was in the water at the time; they did not do anything to it, they only made a threat.

22,897. Then on that occasion you were not compelled to leave the ground?—Our net was in the water and we could not leave it; they only threatened to heave their grapnel in the next time we went out with the net. We went to a place where there was no seine at work, we had the two seines with us, and we took the stem, but a large seine-boat came and drove us away.

22,898. How did they contrive to drive you away?—I do not know, but the fact is that they did it.

22,899. How many men had you in your two boats?—10 men.

22,900. How many men had they?—17. We went away in order to keep the peace, and in order that there might not be a fight on the water. The fact is, however, that they prevent us from fishing by physical and brute force.

22,901–2. Do you conceive that you have no remedy in that case?—We know of no remedy unless we oppose them, and then they run us down. Then if we feel ourselves aggrieved we might appeal to the law. But that is a very dear thing for men without much capital to try; lawyers I have heard cost a great deal.

MEVAGISSEY.

J. Hunkin.

29 Mar. 1864.

22,903. What you wish to suggest to us is that it is the force of the capital of the large seiners that drives you out?—No doubt; the men appear to be supported by the owners, but how far they are supported by them I do not know. This sort of thing has been carried on in many cases, and not in mine alone. I could mention the names of several men who have had little seines in times past, and who have been driven out by this kind of treatment. We think it is very hard upon us.

22,904. Is there any law, Act, or custom of the trade that is binding?—There is nothing more than the rule which says that the legal stop-seine shall be fourscore cloths, that would be about 160 fathoms, and ours when we put our two together makes a seine of about 200 fathoms; ours, however, is not as deep as the long seines; theirs is 14 fathoms deep, while ours is only 12.

22,905. Then your two seines put together are within a few fathoms of some of the largest seines?—There are very few larger. Some of them are from 200 to 208 fathoms, but not many; I am a maker of seines, and therefore I know.

22,906. (*Mr. Lefevre.*) What is the depth of your seine?—12 fathoms.

22,907. (*Professor Huxley.*) I believe there is a regulation here that the seine that takes its turn shall be of a certain size?—Yes, it must be fourscore cloths, which will make 160 fathoms.

22,908. How did that regulation come about?—It was made years ago among the seiners themselves.

22,909. By whom was it made?—By the seine owners.

22,910. Was it a voluntary obligation?—Yes; there is no parliamentary law or statute law of any kind upon the subject. In St. Ives they have an Act of Parliament.

22,911. A local Act?—Yes.

22,912. Here you have none?—Here there is no such thing, and we complain of the course taken by the large-seine owners as a piece of injustice; we think we ought to be protected against them.

22,913. But suppose your statement is correct, your protection lies at common law. If you do not seek the protection afforded you by the common law of the realm, nobody can give it to you. For instance, if a number of persons combine to drive me out of this town, I have a remedy at common law, but I have no other?—Our seine owners we think have taken the advantage of influencing every ministry which has held office of late years; all the inspecting officers sent down here have been instructed to carry out their views.

22,914. If there be no Act of Parliament or statute law relating to the question, you must seek your protection from the ordinary magistrates; if you are assaulted, or the like, your protection is the same as mine. You cannot expect any special legislation when you are not wronged lawfully. If the law is violated you have your remedy by going to the proper authorities?—If I thought I could get any remedy I would apply; we ought to have some one on the bench who would act in an impartial manner.

22,915. (*Mr. Lefevre.*) I suppose you would like some one to be stationed on the fishing ground to keep peace between you?—If something is not done I think it may lead to disastrous consequences; men do not like to have what they consider their rights trampled out of them.

22,916. (*Professor Huxley.*) Suppose the large-seine owners are going on in this way against the law, would it not be worth your while, jointly, to have it settled once for all?—The danger of the matter is in its leading to a rupture on the water. When the fish are in they do not tarry very long, they must be caught there and then, or not at all. We had a little catch last year; if we had missed that opportunity in consequence of a disturbance on the water, our season would have been gone, and we should have done nothing for the rest of the season.

22,917. Our position as Commissioners here is this: if you can tell us that there is any law which acts oppressively upon your interests, it is our duty to inquire into it. If, for instance, you told us there was a certain law here enforcing a particular length of seine, and were then to add that you were unable to make them so long, we should make a report to that effect to the Government; but all you tell us is this, that certain persons here act unlawfully, and that is a matter in which we cannot help you. Do you ask for Government protection in this matter?—Unless the seine owners will come to some legitimate arrangement I think we must apply somewhere or other. We would rather, if possible, that the question should be settled in a peaceable manner. All we want is to know what we are to do. I think the seine owners have placed themselves in a false position in the matter.

22,918. Do you wish to appeal to the Coastguard to protect you in your rights?—Yes.

22,919. You want something of that kind?—Yes, something to protect us from being interfered with when we are engaged catching fish in the season; I have been employed in driving as well as in seining. I must say that I like driving best, but I wish to be able to go out and catch some of the fish when they appear off the coast.

22,920. You wish to be protected in what you consider to be the exercise of a legal right?—Yes.

22,921. Are there any other small seines here besides yours?—Yes.

22,922. How many are there?—We have four, I believe.

22,923. Do their owners all make the same complaint?—Yes, I believe they do.

The witness withdrew.

J. Scantlebury.

JOHN SCANTLEBURY called and examined.

22,924. (*Mr. Lefevre.*) Do you make the same complaint as Hunkin?—Yes, I am labouring under the same difficulty.

(*The witness John Furze.*) We have a small seine 150 fathoms long, and we make the same complaint.

22,925. (*Professor Huxley to Scantlebury.*) Then it appears that there are four or five of these small seines here, and your complaint is that you are not allowed to use them?—Yes, I was first off last year, and I do not know what I lost. I was so much hindered in fishing that the crew I engaged have threatened to leave me unless I can make some other arrangement; now I have increased my seine this year at an expense of fourscore pounds. There will be no end to the loss I shall sustain if some understanding is not come to with the seine owners.

22,926. (*Mr. Lefevre.*) Have you increased your seine so as to come within the regulations made by the seine owners?—Yes, I have it in contemplation to do so. It would not be more than 160 fathoms then if it came up to the standard of 80 cloths. Then I should be allowed to hold a stem, but they tell me I shall not be allowed to do so otherwise. To do that, however, entails so much expense that there is not one out of ten who is desirous of incurring it.

22,927. (*Professor Huxley.*) Is the tendency of this regulation to keep the small capitalist out of the field?—Yes, and that is what we complain of.

22,928. (*Mr. Lefevre.*) Is it necessary that there should be any regulation of this sort?—I think there must be some regulation with regard to turns.

22,929. I suppose the breadth of the stations or stems has been regulated with regard to the size of the nets?—I think the marks have been there from time immemorial. The stems were laid down in olden times. They are certainly older than my grandfather's time.

MEVAGISSEY.

J. Scantlebury.

29 Mar. 1864.

22,930. (*Professor Huxley.*) Would the increase in the number of seine nets tend to injure the chance of each person to catch fish by diminishing the number of turns they could take?—Sometimes it would, and sometimes it would not matter how many were there.

22,931. The greater number of persons there are to take turns, the fewer must be the number of turns any given net can hold?—Yes; but I have known in my day the time when the fourth turn has taken the greatest shoal of fish.

22,932. But, as a general rule, the greater the multiplication of the number of nets, the less chance there is of catching fish for each boat?—Yes.

22,933. If there are 20 boats now, and you double that number, making it 40, would you not lessen the average chance of profit by one half?—Not so much as that, because if there were 40 seines it would not damage them to the extent of one half. It would make some difference, no doubt, but not to that extent.

22,934. But in the long run of chances it must come to that?—When there is a large shoal of fish there is plenty for all. I have seen every one of the nets shot and still there were plenty of fish left.

22,935. That can only apply when the number of nets is fewer than the number of stations. If the number of stations is fewer than the number of nets then some must be excluded?—I have seen them take fourth, fifth, and sixth turn in the same station. I have been riding a sixth turn myself.

22,936. (*Mr. Lefevre.*) We have been told that there are 12 stations and 11 nets?—Yes, that is so.

22,937. If you were admitted to equal terms with the large-seine owners, there would then be 15 seines and still only 12 turns?—Yes.

22,938. That would not give the owners of the large nets quite as good a chance as they have now?—Not exactly.

22,939. (*Professor Huxley.*) It takes a considerable time to empty the net of pilchards?—Yes.

22,940. How long does it take?—A tolerable catch may be taken up at once; for instance, if we have 100 hogsheads or so; but if we get 200 hogsheads or more it will take two or three days to take up.

22,941. All the time they are in the net the seine must keep the station?—No, the turn is lost as soon as the net is shot overboard: as soon as the end of the seine is gone the turn is gone too.

22,942. Another can come and shoot?—Yes.

22,943. (*Mr. Lefevre.*) I understand from your evidence that you wish to be put upon the same footing as the large-seine owners?—Yes, that is what every man in our position would desire.

22,944. Do the seine-net men come down every day and take up their station, or only when they have a notion that there are fish there?—They let what they term their dan or buoy remain there when they go away; by two o'clock in the afternoon it is ended and a boat comes up.

22,945. Do they take up their station every day in the season?—Every day when they are out, their first turn, second, or third.

22,946. They do not wait till they fancy the fish are near?—No, they take their station every day.

22,947. (*Professor Huxley.*) Who arranges the rotation to begin with?—Sometimes a chase is rowed by two or three boats, and you will see the whole town excited with it.

22,948. They have a race for it?—Yes; the way it is done is this: if I go out to take my first turn, if there is no person to oppose me I go out quietly, but if there are two going out together they pull off their jackets and go in for a chase.

22,949. At the beginning of the season is there no arrangement by which the turns are taken with order and regularity?—No; if two go out together there is always a chase.

22,950. (*Mr. Lefevre.*) You do not wish to have the regulation done away with altogether?—No, I do not think that would be the best way of settling the difficulty.

22,951. Do you think that confusion would result?—Yes.

22,952. What you want is that the small-seine net owners should be placed on the same terms as the large-seine net owners?—Yes, I do not want to do away with the regulations in the bay; for instance, we should have no objection to the race.

22,953. Is there anything further that you wish to remark upon?—No. I have had some thoughts in my own mind with regard to the diminution in the quantity of fish. I am quite confident that there is a diminution.

22,954. Of all fish?—Of a great many. I do not think that we have had for a great number of years as many pilchards as we have had formerly, and I do not think we get as many hake and several other kinds of fish.

22,955. Do you think there are as many whitings?—I do not think there are. As to the pilchards, I have watched them with a great deal of interest, and I have thought from what I have seen and experienced that in the month of May the pilchards leave our coast. There seems to be some law of nature similar to that which regulates the coming and going of the flowers, and the ebbing and flowing of the sea, and so on. In the month of May generally—sometimes it is a little earlier than others—the pilchards retire from our coast into deep water, and they are found there in June.

22,956. Are they full fish then?—Yes. Upon one occasion I took some in the beginning of May, and thought I had an opportunity of selling them. I took 30 maunds or 10 hogsheads, brought them into Mevagissey, and cured them. I thought I had a market for them, but owing to the spawn being in them they were a dead loss altogether. My opinion is that they retire from the shore and go out into deep water to spawn.

22,957. You believe that they spawn in deep water?—Yes. If you take one of them when it is very large and full of spawn, as those we catch occasionally in our mackerel nets, and just press your finger just over its belly, the spawn will drop like lead into the water and go to the bottom. They deposit their spawn there; it is there disturbed by the operations of the trawlers and the passing of their beam over it. A friend of mine has made a calculation as to what ground they go over in the Channel, and I find that the greater proportion of it is trawled over. I believe that they kill a great deal of the spawn and weaken the rest. For that reason our pilchard fisheries have not been so profitable of late years as they were formerly; that is the result of my experience. I believe that when they haul up their trawls in deep water they are obliged to take up spawn with them. The spawn hangs to the net in small globules, and they have to shake the net in order to get rid of it.

22,958. Have you seen that done?—I have never seen it done myself, but I have seen others who have.

22,959. Are they here?—Yes.

22,960. (*Professor Huxley.*) Do you think the trawlers are injuring the pilchard-fishing?—Yes, I think they are injuring all the fish that go into deep water to spawn. Anything troubling the young in that way must injure its life, or at least its strength.

22,961. Have you had large hauls for the last year or two?—Do you mean of pilchards?

22,962. Yes.—Not so large as they used to be. I will give you an instance. When first I went pilchard-driving I had 40 dozen of twine; now I do not think we take as many with 50 or 60 dozen as we did then with 40. The coming of the fish shows itself in circles. I think there is nobody who can give a strict account of its coming, but I do not think there are as many fish in the pilchard way as there were formerly.

22,963. You have been pilchard-driving as well as seining?—Yes.

22,964. In your opinion does that interfere with the seining?—I do not think the pilchard-driving in

any shape or form interferes more with the seining than the seining does with the pilchard-driving. In all kinds of fishing if you happen to come in contact injury is done to both parties.

22,964*a*. What one catches of course the other cannot have?—Just so. Sometimes the pilchard-seines will take a great quantity of fish. Mr. Roberts has said that they are not sold for manure, but that has been done. I have bought them as low as 3*s*. a maund, with fully 2,000 in the maund. In such a case as that all price is knocked down.

22,965. Have you yourself seen the pilchards sold for manure?—Yes; in the case of which I have just been speaking, Mr. John Pearce came down on the pier and condemned them when they were brought in as not fit for the merchants. I believe there are others here who can recollect the circumstance. The fish laid on our wharves till the stench became intolerable. It was during the harvest time, and the farmers could not come here to take it away.

22,966. But you do not think drift-net fishing does any injury to the seine-fishing?—I have sometimes seen drivers shoot their nets where I would not have shot them, and where they ought not to be shot.

22,967. Do you mean that they shot their nets too close to the seine-nets?—Yes. I think the drivers, like honest, upright men, when the seiners have been out riding the stem for 24 hours, should allow them to have the place for shooting their nets without interfering; but in a company where you have seiners and drivers you will always find somebody who will break over the bounds.

22,968. Is it desirable to enforce the regulation for keeping the drivers a league and a half distant?—That would be the ruin of the fishermen.

22,969. Would it be desirable to have some regulation for keeping the drivers always at a certain distance from the seiners?—It would be very difficult to do that. The seines only come out occasionally; they are not constantly employed. Sometimes they do not stop out longer than a month, and at other times for two months, or for 12 or 13 weeks. No man would like to be kept from the fishing ground when there are fish there if there was no one else to catch them.

22,970. I was not talking of that; I mean when the seine is actually in the water. In such a case could no regulation be made by which the drift-men could be kept a certain distance from the seiners, suppose a mile, or any other distance you please?—There was a time when we tried to arrange that matter. I took a part in it, and I used all the moral power I possessed to bring these disputes to an end. I will tell you the circumstances as well as I can relate them. Alfred Fox, of Falmouth, had an interview with a gentleman upon the subject, but whether he was connected with the Government or not I cannot say. By his request he came to Mevagissey. The drivers were called together and the seine owners also. I know what our party was prepared to give, and I think it was quite sufficient room. Mr. John Pearce proposed a certain distance, but the seine owners would not listen to the proposition, and from that time there has been no attempt to arrive at anything like a right understanding upon the subject.

22,971. Were the seine owners of opinion that the distance proposed was not sufficient?—They would not listen to the proposition of the gentleman I have mentioned.

22,972. What was his proposition?—There were to be certain marks on the land which they were to keep outside.

22,973. Under all circumstances were they to keep outside those marks?—They were to come to some regulation about it, but the only thing absolutely mooted was the distance.

22,974. What was the distance?—Mr. Pearce proposed the Gwingees and the Deadman Point.

22,975. They were not to come inside a line drawn between those two points?—Our proposition would have gone a deal further than that. I am simply stating now that an attempt was made to come to an understanding.

22,976. (*Mr. Lefevre.*) Is there not a great deal of ground between this place and Falmouth where seine-nets cannot be used at all?—Yes, a great deal.

22,977. Upon such grounds is there any reason why the drift-net fishermen should not go as near the shore as possible?—No.

22,978. I suppose that the fish often strike the shore in places where the seine-nets cannot be used?—Certainly; there are only particular places where the seine-nets can be used.

22,979. (*Professor Huxley.*) Would it not satisfy the seine owners if there was a regulation to keep the drift-men a certain distance outside the seine-nets when in use? Suppose a seine-net has taken its turn, if there was a regulation to keep the drift-men a mile or two miles outside would that not answer your purpose?—In my humble opinion, if the drift-net men were required to keep where the seine men could not shoot their seines that would answer every purpose.

22,980. You think the drift-net men should confine their fishing to places where the seines cannot be shot?—Yes; if the drift-net men kept outside the ground where the seiners seine that would be quite enough.

22,981. But how far outside should they be kept, that is the point?—In some cases the distance would be greater than in others, but they would know from their soundings pretty well how far the seines could be used.

22,982. Would there not be great danger of drifting in with the wind or tide?—I have sometimes hauled in my nets as fast as I could when I thought I was drifting in too near. Sometimes the tides will carry us in quite a different direction from that which we thought or expected.

22,983. Is there anything else that you wish to mention to us?—No, I think not.

22,984. Can you tell us whether the hook-fishermen have now to go off further than they did in former years?—I have not been a great deal at the hook-fishing, but I understand from our fishermen that they go now as far as they did formerly. I do not know that they are obliged to go further.

The witness withdrew.

MATTHIAS DUNN called and examined.

M. Dunn.

22,985. (*Professor Huxley.*) You gave us evidence at Plymouth, I believe?—Yes, in reference to the spawn in the trawls.

22,986. Is there any other point on which you wish to speak?—I only wish to say that when we have been out with our mackerel-nets we have sometimes noticed a considerable number of pilchards.

22,987. At what time of the year?—In May and June, and the trawlers have been trawling on the ground where the fish have been seen.

22,988. Do you think that the trawlers have taken up the spawn from the bottom?—I have every reason for thinking so.

22,989. Have you ever been on board of a trawler?—Yes, but not in deep water.

22,990. Have you seen spawn brought up in the trawl-net?—Not in the shallow waters, but I have noticed spawn fast to the net.

22,991. Do you know of any person who has himself seen spawn brought up in the trawl-net?—No, I think not. Forty years ago a number of Brixham trawlers went up to our place, and some of our old men have told me that when these Brixham trawlers were at Mevagissey they stated that they had seen large quantities of spawn taken up. They admitted

MEGAVISSEY.

M. Dunn.

29 Mar. 1864.

that the way in which they were fishing was sure to do harm to our fisheries here. I have conferred with some of the men who heard these statements made.

22,992. Will your port here shelter Brixham trawlers?—Yes.

22,993. How many can get in?—As many as 40 at a time.

22,994. Then in that case, if you pleased, you could manage to trawl from this port?—It would be difficult in the winter time when we have strong gales of wind blowing.

22,995. (*Mr. Lefevre.*) Is it a tidal harbour here?—Yes, and we give shelter to hundreds of tons of shipping all the year round.

22,996. (*Professor Huxley.*) Is there any other remark you wish to make about these matters?—I should like to add to the statements made by Mr. Hunkin, that if we as drifters were required to keep a certain distance from the land it would be entirely ruinous to us. As a rule we never catch small fish in our nets, or fish with spawn in them.

22,997. You never get small fish or spawn in your drift-nets?—No.

22,998. Do you use the seine-net?—No.

22,999. You are not engaged in pilchard-seining?—No.

The witness withdrew.

J. Dunn.

JOHN DUNN called and examined.

23,000. (*Professor Huxley.*) Are you a fisherman here?—Yes.

23,001. How many years have you been engaged in fishing here?—40 years.

23,002. Upon what point do you wish to make any remarks?—I was brought up to the seine-fishing, as was my father before me, but I found that it was impossible for me to get a living out of it. I should have starved if I had continued at it, and therefore I went to the drift-net pilchard-fishing.

23,003. Had you a share in the seine you worked?—Yes; I had a sixteenth part, and we had 7*s.* 6*d.* a week for going with it.

23,004. You had a sixteenth part?—Yes, and I was out with it for several years, and we caught no fish. Besides that it cost 8*s.* 6*d.* to allow for my sixteenth part of the cost of keeping the net in proper order. No man could obtain a living from an occupation of that sort. When I got the opportunity I bought a few pilchard-nets. I then began to get on in the world, and now I am in tolerably good circumstances. I have now both mackerel and herring-nets as well as pilchard-nets.

23,005. You found that the income you derived from the seine-net fishing was not sufficient to keep you?—No; it was altogether ruinous to me, and would have brought me to the union if I had not given it up.

23,006. Do you agree with the other witnesses that any regulation which required you to keep a certain distance away from the shore would be injurious to the interests of the drift-net fishermen?—Yes, I do. Upon one occasion I was fishing for four weeks successively in our bay with a fleet of drift-boats. There were fish enough for all of us without fishing on Saturday nights or Sundays. There the fish remained all the time for four weeks.

23,007. Could those fish have been caught by the seine-nets?—Yes, some of them; but we can take them when the seine-nets cannot; and if we were kept outside for any distance, at such times for instance as when the weather is stormy, we should be ruined and brought to the union. We depend upon the fishing for our living, while the great majority of those who go with the seine-nets are landsmen, such as farm labourers, mechanics, blacksmiths, tailors, and shoemakers. We are fishermen solely, and have nothing else to depend upon. I have no wish to interfere with the seines. I have frequently hauled in my nets because I did not wish to come into contact with them, and I have gone by the seines when I have seen a shoal of fish, and have not shot my nets, because I was afraid of getting into contact with them. When we have strong weather we are glad to get in under shelter of the land, and it would be hard to prevent us from taking the fish there when we cannot go out further. If we are prevented from coming within a certain distance of the land it would be ruinous to us. We have no desire to interfere with the seiners, and if we go where they cannot use their seines we think we go a sufficient distance. If we are obliged to go further out it would ruin us all. At Mevagissey all the men depend upon the drift-fishing.

23,008. (*Mr. Lefevre.*) Between this place and the Deadman Point is the coast fit for seine-nets?—Not in many places.

23,009. Is the ground fit for seine-nets mostly eastward of this?—In St. Austell's Bay there is ground where the seines can be used.

23,010. (*Professor Huxley.*) Have you ever used the small seine?—No.

23,011. Is there any other point on which you wish to make a remark? Is there any hardship which presses upon you?—I do not know that there is. There is not as much hooking fish, generally speaking, or indeed of any other fish, as there used to be. Of no kind are there as large quantities as there were years ago.

23,012. Do you go further out now when engaged in fishing with the hook and line than you did formerly?—No, I think not; but it requires a third more nets now to take the same quantity of fish.

23,013. Is that because the number of drift-net fishermen has increased so much?—No, I do not think so, and whether it is owing to the trawlers killing the spawn I am not able to say.

23,014. Have the trawlers ever got foul of your nets or interfered with your fishing?—No.

The witness withdrew.

W. Pearce.

WILLIAM PEARCE called and examined.

23,015. (*Professor Huxley.*) What is it you wish to say to us?—I was engaged with the seines for a number of years, and now I am established in the pilchard-driving, to which I look for a living. I have come as it were from what you would call complete poverty, and now I have had such a rise that I care not for anyone, thank God for it.

23,016. Then you agree with the previous witnesses who have spoken on the same subject?—Yes.

23,017. Have you anything new to tell us?—No; but I believe that if the matter went by a majority we should gain the day.

23,018. Is there any new point that you wish to bring before us?—No, I have nothing to say except with regard to the greater value of the pilchard-driving to us fishermen. I have found it to be a prosperous thing ever since I took it in hand, and while following the seining system I had sunk down almost to nothing. I had 15 children, and often I could not raise bread for them on the Sunday to eat. I have been obliged to go to the clerk of Mr. Fox for assistance. For more than 20 years I was in that position, unable to support my family. I then found that I was obliged to give up seining.

23,019. Would any of the regulations which have been suggested about keeping at a certain distance from the seines interfere with your power to catch fish?—No; I have no wish to interfere with them, and I believe that they have no wish to interfere with us.

MEVAGISSEY.

W. Pearce.

29 Mar. 1864.

23,020. Would you like to see some fair regulation established which would enable both descriptions of fishing to be carried on?—Yes.

23,021. (*Mr. Lefevre.*) Do you recollect the seine-fishing before the bounty was taken off?—I can just "mind" it, but I cannot recollect much about it. I have heard my father talk about it. There was a sum given by the Government to keep the fisheries up.

23,022. Do you recollect what effect the doing away with the bounty had?—No.

The witness withdrew.

John Sampson Jago recalled and examined.

J. S. Jago.

23,023. (*Mr. Lefevre.*) I wish to ask you a question or two in reference to the regulations with regard to stemming. Are you acquainted with the mode in which the stems or turns are taken?—Yes, but I think it has already been explained to you. There is no absolute legal regulation upon the subject, but a custom has prevailed from time immemorial.

23,024. Would it be possible to adopt some regulation which would have the effect of admitting the small seines on the same terms as the large ones?—I think some regulation might be made.

23,025. Then do you think that the grievance of which the fishermen here complain is a true one?—I do not think that the grievance is very great, but when a seine is of a certain size it might be admitted. If I understand rightly, in former days the seines were not as large as they are now. I think there might be some regulation to admit them under certain limits. I do not see why a small seine should not have the same right as a large one.

23,026. Do you think they ought to be allowed at all?—Yes.

23,027. What limit would you impose?—I am not prepared to say. I have hardly given any consideration to the question.

23,028. Do you think that the owners of the large seines would be ready to discuss the question?—I should think they would. There is a certain limit within which they might be admitted; that is my own opinion.

23,029. You would admit them to the same turns as the larger seines?—Yes, they should take their turns fairly with the others.

23,030. (*Professor Huxley.*) Why do you think there should be a limit?—There would be a great interference with the fishing if there was not.

23,031. Do you think there is any vested right?—Yes, from time immemorial, but I do not believe that 100 years ago the seines were as large as they are now. I suspect that some of the small seines here now will come up to what the seines were generally at that time. I cannot say for certain, but I have a strong notion that that is so.

23,032. (*Mr. Lefevre.*) You think it would not injure the large-seine owners if the small seines were admitted on equal terms?—I think they should be allowed, and they might meet among themselves and arrange how it is to be accomplished.

23,033. (*Professor Huxley.*) Do you think that the opposition to the small seines has arisen not so much on account of the fishing and the benefit of the fishermen themselves as on account of the large capital invested in seining?—Altogether I think a certain freedom of the sea ought to be allowed. I do not go altogether by the amount of capital invested, but if a seine came up to anything near the size of the larger seines, then I think the capital invested in them should be taken into consideration as well as that invested in the larger seines.

23,034. (*Mr. Lefevre.*) Would there be a good deal of confusion if there was no regulation?—Yes, very much. From time immemorial there have been regulations adopted all round the coast.

23,035. (*Professor Huxley.*) Has the Duchy any rights over the fisheries?—No. Perhaps you will allow me to say a word in reference to the statements which have been made by some of the fishermen that when they were employed in seining they were unable to get a living. They say they have frequently gone out and have got nothing. That may be true to a certain extent, but they had the lurcher, which they used as a fishing boat all the year round. The master seiner had the privilege of using the boat, and when the pilchards were on the coast they did very well.

23,036. (*Mr. Lefevre.*) The pilchards were a kind of harvest to them?—Yes; but they had the boats to go fishing with—the lurchers. They were not permitted to go as drivers, but they could go out, and catch herrings with their nets the same as other boats.

23,037. (*Professor Huxley.*) Were they employed to do that by the seine owners?—No, the profit all went to the men themselves. The master of the seine is allowed the use of the boat to go fishing in. He has 8*s.* a week the same as the other men, and something extra if they have a large catch, and the boat is kept for his use all the year round. The father of the last witness had the lurcher.

23,038. (*Mr. Lefevre.*) Are not many of the men employed in seining landsmen, and not fishermen at all?—Yes, but they do all their day's work before they go out; that is a great advantage they have.

23,039. (*Professor Huxley.*) How many out of the 16 persons in a crew have permanent employment or permanent wages all the year round?—Only the master who has the boat.

23,040. Then are the other boats not used?—No, they lay them by.

23,041. So that there is practically permanent wages to the master seiner?—Yes.

23,042. But not to any other person?—Not to any other person.

The witness withdrew, and the inquiry was adjourned until the 30th March at Falmouth.

Falmouth, Cornwall, Wednesday, 30th March 1864.

FALMOUTH.

J. Mayne.

30 Mar. 1864.

Present:

Professor Huxley, F.R.S. (Chairman). | G. Shaw Lefevre, Esq., M.P.

Jonathan Mayne called and examined.

23,043. (*Professor Huxley.*) Are you engaged in fishing here, Mr. Mayne?—Yes, in the oyster fishery.

23,044. You are a native of Flushing, I believe?—Yes, I have lived there 50 years.

23,045. Have you been engaged in the oyster-fishing all that time?—Yes.

23,046. Are you acquainted with the modes of fishing that are practised in the neighbourhood of Falmouth?—Yes.

23,047. What are the modes of fishing practised here?—They use the ground-seine principally in the harbour.

23,048. What other kinds of fishing are there?—At the mackerel time they have all floating seines, which are seines of a larger description.

23,049. They are mackerel seines?—Yes.

23,050. Is there any pilchard-fishing here?—No, not in the harbour.

FALMOUTH.

J. Mayne.

30 Mar. 1864.

23,051. Is there any pilchard-fishing practised by boats going from this port?—Yes, belonging to other places, but not to Falmouth.

23,052. Not to Falmouth?—No.

23,053. Is there any herring-fishing practised here?—No, very little indeed. There may be a little by the ground-seines in the winter.

23,054–5. Are there any long-line fishermen here?—I think not.

23,056. Is there any considerable number of hand-line fishermen?—Yes, I believe there are a good many in the harbour.

23,057. What are the principal fish they catch here?—Cod and hake.

23,058. They catch them by the hook?—Yes, outside.

23,059. What kind of fishing are the fishermen who belong to this port principally engaged in?—In the winter time they are principally engaged in the oyster-fishing.

23,060. And in the other parts of the year they are generally engaged in the line-fishing?—Yes.

23,061. Can you give us any notion of the number of persons who are engaged in fishing here?—Do you include the oyster-fishing as well?

23,062. Yes, all the fisheries?—I do not know how many there are, but there are some hundreds.

23,063. Do you know how many boats of all kinds are engaged in the fishing?—In the harbour?

23,064. Yes; hailing from this port?—There are from 200 to 300 boats, I believe. Perhaps there may be 300 altogether, but you would be right in saying from 200 to 300.

23,065. They are partly hookers?—Yes, in the summer time, and in the winter time they are engaged in the oyster fishery.

23,066. Are the same boats employed in the herring and in the oyster fishery?—There are not so many engaged in the herring fishery, not by a great many; perhaps only a very few of them go to the hook-and-line fishing.

23,067. But is the same boat used?—Yes; it is the same boat.

23,068. What is the kind of fishing boat used here, how large is it?—They have a sailing boat varying perhaps from 25 to 30 tons down to a punt or to a very small boat.

23,069. What will be the average size of the 200 to 300 vessels employed here?—They are generally small boats.

23,070. What is their tonnage?—They are merely two-handed boats.

23,071. Mere wherries, in point of fact?—Yes; small boats, from 10 feet to 18 feet long.

23,072. Is the fishing from this port carried on mainly in the harbour?—The oyster-fishing is in the harbour.

23,073. I suppose that the boats which go outside and follow the hand-line fishing are larger boats?—There are a few larger.

23,074. But not many?—No, they go out in small boats in the summer.

23,075. What is the value of one of these boats with its fittings, I mean the chief boats used here?—About the medium boat?

23,076. Yes.—I should say from 25*l.* to 30*l.*

23,077. Is that the hull of the boat or the boat and its fittings?—The hull of the boat.

23,078. And what would be the value of the fittings?—The gear would be worth about 3*l.* or 4*l.*

23,079. Within your recollection has the number of the boats much increased?—Yes, very much.

23,080. How many were there when you first knew this port a few years ago?—There were a few boats then on the other side of the water at Saint Mawes, but there was hardly a boat here.

23,081. Not at Falmouth?—No.

23,082. Were there many at Flushing?—I believe I was the first man there at Flushing.

23,083. Then when you first knew the port there were very few boats?—Yes.

23,084. Were there a score?—No, not so many inside here, but there were a few at St. Mawes on the other side.

23,085. How many were there at St. Mawes?—There may have been a score or two at St. Mawes.

23,086. Then will it be fair to say that the number of boats has increased of late years seven or eight times?—Yes, and more than that.

23,087. Where are the oyster beds?—Almost all over the harbour.

23,088. Are there any regular beds, or are the oysters scattered over the harbour?—They are scattered all over the harbour.

23,089. What is the average depth of water in the harbour, do you happen to know?—I do not know exactly.

23,090. The most part of it seems to be under 3 or 4 fathoms, judging from the charts?—There is a great part of it deeper than that.

23,091. That is in the deep channel?—Yes.

23,092–3. But the great area of the channel seems not to be more than that?—The oysters are deeper than that.

23,094. Do you include under the name of harbour all this Carrick Road?—Yes, all inside the rocks.

23,095. There you have a deep mid channel of 12 or 14 fathoms?—Yes.

23,096. Do the oysters abound all over the harbour? Yes, almost all over.

23,097. Outside low-water mark?—Yes, all through the bed of the channel.

23,098. Have you noticed any diminution in the quantity of oysters taken by the fishermen here?—Yes, there has been a very great diminution.

23,099. Has the number sensibly diminished of late years?—Yes.

23,100. The average yield per boat has decreased?—Yes, very much so.

23,101. I suppose the oysters here are taken in the ordinary fashion by a dredge?—Yes.

23,102. What is the size of the dredge?—The dredge is nearly three feet long.

23,103. With two scrapers in the ordinary fashion I suppose?—No there is only one.

23,104. Only one?—Only one.

23,105. What will be the weight of the dredge?—The belly of the dredge will weigh 5 or 6 lbs.; that is the part of the dredge that comes on the ground. The dredge altogether will probably weigh from 25 to 30 lbs.

23,106. How is the dredge worked, is it worked commonly under sail?—All the larger boats are under sail.

23,107. Are the smaller boats worked by men rowing in them?—Yes, they are worked with a winch.

23,108. Do they lay a warp out?—Yes, they lay a warp out ahead; they go the length of the warp, heave the dredge overboard, and then heave them in by the winch.

23,109. They are able to do that, this being a sheltered harbour?—Yes.

23,110. It could not be done in the open sea?—No.

23,111. It is done when the water is rather shallow?—It is done in the channel also.

23,112. In the channel as well?—Yes.

23,113. In your early recollection what was the average take, what at that time would you consider a fair day's work?—Two men would get from 8 to 10 or 12 bushels a day.

23,114. What will be a fair take now?—Two men now cannot get more than half a tub or a little more say from half a tub to three quarters.

23,115. To what cause do you ascribe that falling off?—To too large a drain upon them.

23,116. Then in point of fact you are of opinion that they have been over-fished?—Yes, and I also think it is owing in some measure to the brood not being properly protected.

23,117. Since you have known the harbour have there been any fence months during which you were not allowed to take oysters?—Not during the whole of the time.

23,118. Was it so when you first knew the fishing?—No, there were no close months then.

23,119. At that time you fished when you pleased?—Yes.

23,120. And at that time did you take oysters of any size you liked?—Yes.

23,121. There was no restriction upon that?—No, none at all.

23,122–3. When was any restriction brought to bear on the fishing?—I cannot recollect when it was exactly, it would probably be about 10 years ago.

23,124. Why was that restriction placed upon the fishing; was there any special falling off?—The order came from the Custom House that oysters were not to be taken in the close months.

23,125. What months were laid down as close months?—The months of May, June, July, and August.

23,126. During the rest of the year you might take them as much as you pleased?—Yes.

23,127. Was there any restriction made with regard to the size of the oysters you were to take?—I think not at that time.

23,128. Have you now any regulation as to the size of the oyster?—There was one established last year and the year before.

23,129. What was the regulation?—There was a gauge provided.

23,130. What was that gauge?—It was simply a ring.

24,131. Have you the gauge here or a copy of it?—I have not.

23,132. How large was the ring?—The ring was very large for this harbour. It was too large for this harbour in point of fact. It was introduced I understand from the Jersey fisheries but the oysters they get there will grow up in the course of one year as much as ours will in three years.

23,133. But there was a gauge introduced?—Yes.

23,134. By what authority was it introduced; was it sent down by the Customs?—Yes.

23,135. Do you think the introduction of that gauge has done any good?—No, I think it has done very little good. They continue to take them notwithstanding the gauge.

23,136. Is that because there is not an efficient watch kept?—Perhaps that may be so.

23,137. Is there any inspection of the oysters when they are brought ashore?—There was at that time.

23,138. If the men were found with oysters in their possession too small were they condemned?—Yes.

23,139. Does that not take place now?—No.

23,140. Then what is to ensure the rule being carried out?—Nothing; it is not adhered to at all now.

23,141. Was that because it turned out that there was not sufficient authority to enforce it?—I understood from the Customs House that the Board of Trade did not wish to authorize any interference.

23,142. Do you mean that they were not inclined to prosecute under the Act?—Yes, I believe they did not wish to prosecute.

23,143. Is there any fishing of the oysters in your harbour by people from other parts of England?—Yes.

23,144. Is there any steam-dredging carried on here?—No.

23,145. But boats come here from other parts of England?—Yes, from the eastward principally.

23,146. From Colchester?—Yes, from Essex.

23,147. Do they carry away the oysters to any great extent?—They dredge them and the merchants come down here and purchase them.

23,148. Are they not carried away to be laid down elsewhere?—Yes, they are carried away to be laid down elsewhere afterwards.

23,149. Have you ever had any considerable demand for young oysters to be carried away and laid down in other oyster parks in England?—At one time there was a demand. We were not allowed to go in and take any large quantity; that was a few years ago.

23,150. Do the French come here and get your oysters?—They have done so during the last two or three years.

23,151. Do they offer high prices?—They have been disposed to offer the highest prices.

23,152. Is there any considerable trade derived from the French merchants now in consequence of that?—No, there has not been much this year, but I think there has been over in Ireland.

23,153. Can you tell us whether you have ever noticed the time at which the oysters spawn here?—I do not know exactly; I should think some time in May or June.

23,154. When do you find the spat?—Well, we do not find the spat till some time after.

23,155. In what month do you find the spat?—We find it when we go out to work again in the early part of the season.

23,156. Is that in September?—Yes.

23,157. How big is it then?—It is very small indeed.

23,158. Do you find it in the early part of the year before the fence months?—I think not.

23,159. Have you ever seen it at all?—Perhaps I have sometimes.

23,160. But you have not noticed it particularly in any way?—No.

23,161. Do you find any difference in the shallow part of the harbour, where the oysters are, and in the deeper parts?—As to the brood?

23,162. Yes, as to the time of spawning?—I think not.

23,163. Are there any regular oyster parks here?—Do you mean places where they are laid down?

23,164. Yes.—We have ground where we put the oysters after they are caught.

23,165. Whereabouts is it?—It is from the Green Park there towards Penryn.

23,166. In the Shallows?—Yes, on the flats.

23,167. You lay them down within the tide-mark?—We lay them down inside low-water mark.

23,168. (*Mr. Lefevre.*) Are those grounds private property?—We have had it for a long time. I have had some for the last 50 years.

23,169. Have you a portion set apart for yourself?—Yes, I have got a certain part and other people have got a part.

23,170. Do you pay any rent for it?—No.

23,171. (*Professor Huxley.*) Do you fatten your oysters there?—They improve there very much.

23,172. But you do not fatten them artificially at all?—No.

23,173. You do not feed them there?—No.

23,174. Do you choose by preference places where fresh streams are running?—Not particularly.

23,175. You do not find that you derive any particular benefit from that?—No; on the contrary, we find if there is a great deal of fresh water that the oysters do not thrive as well.

23,176. How long do you let them live before you take them away for sale?—We catch them in the fall. Those we caught in the last fall we shall dispose of the year after, that is to say, not the year following but the year after that.

23,177. So that they would be laid down for about 18 months?—Yes, about that.

23,178. Do you think that they are all the better for remaining on your beds during that time?—Yes, we think they are.

23,179. Do they fetch a higher price in consequence?—They grow and fatten, and in the market they bring a higher price.

FALMOUTH.

J. Mayne.

30 Mar. 1864.

23,180. Is the oyster you have here a large oyster?—No, it is not large.

23,181. There are some parts of the world where they feed oysters regularly?—Yes.

23,182. You have heard of that practice?—Yes.

23,183. But you do not adopt it here?—No.

23,184. Do you make any complaint here of the trawlers?—No, I think not.

23,185. Are you aware whether the fishermen here have any matter for complaint at all?—I do not think they have, nor do I think there is anything that can be remedied.

23,186. (*Mr. Lefevre.*) The oysters you dredge up from the bottom of the harbour are not fit for immediate eating?—No.

23,187. Are they green in colour?—Not now; they used to be.

23,188. That is not the case now?—No.

23,189. But they are not fit for eating when they are taken up?—No, unless they are laid down either in this or some other place.

23,190. They are not full grown when you take them up, are they?—Not in general.

23,191. I presume that you would prefer to take them up before they are full grown?—They are better when taken up in that way.

23,192. Of those you sell, what is the price you get for them when they are first dredged up?—We buy them ourselves in the first place.

23,193. What do you give for them?—Do you mean of the dredger men?

23,194. Yes.—We have been giving this year 13*s.*

23,195. What was the price before that, some years ago?—1*s.* 6*d.* to 2*s.*

23,196. Then the trade of dredging is very much better than it was?—I do not know that it is, because there are hardly any oysters to be got.

23,197–8. I understood you to say that the takes had only fallen off one-half and you get a price much more than double?—I did not say that they had only fallen off one-half.

23,199. Then do you think the men employed in dredging do not earn so much money as they used to do?—No, I think not.

23,200. I think you said that a great many of the oysters are sold to people from a distance?—Yes.

23,201. To Frenchmen?—Yes, and to the Kentish merchants.

23,202. Do they in preference take the small oysters, or do they prefer to buy the large ones?—They do not wish to have very small oysters.

23,203. What is the size of the oyster for which they will give the largest price?—They are giving a long price now; they are giving 13*s.* for the fresh caught oysters.

23,204. What is the size they prefer?—You cannot get oysters exactly of one size, they are of all sizes.

23,205. All sizes mixed up together?—Yes.

23,206. Are they sorted into different sizes?—No, they go promiscuously.

23,207. Is there any considerable quantity of full-sized oysters dredged up from the bottom of the harbour?—I think full-sized oysters have now become very scarce.

23,208, Are they mainly of that size (*holding up an oyster*)?—Yes.

23,209. That is the size you lay them down in your parks?—Yes.

23,210. And in the course of 18 months they grow to the full size and are ready for sale?—Yes.

23,211. Then during that time do they lose any trace of greenness they may have had?—Yes, they do.

23,212. I think you said that these parks are not private property?—We have the possession of them; we do not call them parks, oyster beds we call them.

23,213. But what right have you to the possession of these beds?—They were of no value when we took possession of them, and we have held possession ever since.

23,214. How many of them are there?—They are situated in a large flat which is divided between four and five people. It is a large piece of flat ground that goes dry at low water.

23,215. How long have you been in possession of those beds?—Just upon 50 years.

23,216. Have the other people who have also beds had them as long as you?—No, not quite as long.

23,217. Has the ground there been allotted to them by the corporation or by any authority?—No.

23,218. What means have you of preventing other people from laying down oysters there?—We keep our goods on the ground, we have always got some there, and other people respect our right. We buy the oysters, in the first instance, from the dredgermen when they come in with them, and that I suppose is better for them than having a ground in which they could put the oysters, because they want the money for the oysters directly they catch them.

23,219. How much ground is there fit for that purpose?—There are a good many acres at spring tide low-water.

23,220. What is the nature of the ground?—It is between hard and soft; perhaps in walking over it you would sink down just over the sole of your boot.

23,221. How many acres altogether does it cover?—I cannot say how many acres.

23,222. Your business is to buy the oysters of the dredger-men and to lay them down in these beds and sell them subsequently?—Yes.

23,223. When do you sell them?—What we have taken before Christmas we shall sell about this time next year.

23,224. Where do you sell them?—We supply the London market with some of them, and also other markets, and if we have any over there are gentlemen here who are glad to have them.

23,225. Is this ground all between high and low-water mark? Are they laid down below low-water mark?—No, there are none laid below low-water mark.

23,226. Has the enforcement of a fence time improved the fishery here or not?—I should think it has.

23,227. You believe that it has?—Yes, I think that a close time is necessary.

23,228. Do you well recollect the fishing before the fence time?—Yes; but there was such a quantity of oysters then that you could hardly judge what benefit it had then.

23,229. I think you stated that the fence time was introduced about ten years ago?—I cannot tell exactly. I think it is about as long as that since it was first introduced; perhaps it may be eight or ten years.

23,230. Has the number of dredges increased since then?—Yes, it has increased materially.

23,231. Were there any complaints before that of the falling off of the oysters?—No, I think not.

23,232. Then the fence time was not introduced in consequence of any complaint of the oysters having diminished?—No.

23,233. Do you know what the nature of the bottom of the harbour here is?—Do you mean muddy or sandy?

23,234. Yes.—It is a little of both; in some places it is quite hard and in others it is rather soft.

23,235. Where do you find the best oysters?—The best oysters are on the starboard side as you come into the harbour.

23,236. Is that upon the soft or upon the hard ground?—It is upon rather hardish ground.

23,237. Does not mud accumulate at all during the fence time?—Mud does not accumulate, but weeds do.

23,238. Do you think that that does any harm to the oysters?—Yes, it does rather.

23,239. (*Professor Huxley.*) Does it occur to you as a practical fisherman, that any sort of restriction or regulation would be of use if established here in preventing a further diminution in the supply of oysters?—I see no other way of preventing it than to provide for the protection of the brood.

23,240–1. How do you propose to effect that protection?—That is a very difficult thing to say.

23,242. In the first place tell us what your plan would be if you had an unlimited supply of men and money; what plan would you carry into effect for the protection of the fishery in that case?—I think some regulation ought to be placed upon the oysters themselves before they are shipped off If there were restrictions put upon the oysters before they were shipped out of the harbour that in my opinion would provide protection for the brood.

23,243. What restriction would you establish?—There should be a person appointed to inspect the cargoes in the first place.

23,244. But what restriction would you adopt, would you fix a certain size for the oysters shipped away and prevent all under that size from being taken away?—Yes, I think so, unless you were to allow the oyster people of the port to take what oysters they pleased and grow them on their own ground. They would grow rather faster on the beds we have here than in their own native ground.

23,245. Then you would not think it expedient to prohibit the dredging up of small oysters from the natural oyster beds?—Not in that case, provided you were to lay that embargo on the exportation of the oysters.

23,246. But you would allow the dredgers to take up oysters of almost any size?—If the people in the port who have grounds were allowed to take small oysters they could grow them very fast on those grounds. The water is much warmer there in the summer time, and the oysters would come to maturity faster.

23,247. Then your objection is to the waste which is involved in taking oysters away before they are properly grown?—My objection is to taking up a vast quantity of oysters and shells and carrying the shells away with the oysters at a time when they are covered with an enormous quantity of the brood, and by that means all this brood is lost.

23,248. But if the brood were merely transferred to the oyster beds you think it would be doing good rather than harm?—Yes, I think so, and in addition to that it would give employment to many people in this port.

23,249. But how about the oysters, would they be all the better for it?—Yes, I think so; they would come to maturity much sooner.

23,250. Then what I understand you to say is this: you would prohibit the exportation of small oysters and brood, but you would not object to their removal from the natural oyster grounds to be laid down on your grounds in order that they might grow?—That is the course I would adopt. I think that would be the best plan for the protection of the oysters, and in that case one man, provided by the government, would be sufficient to do all the work.

23,251. What would you have a man appointed for?—I would have an inspector appointed to inspect the cargoes.

23,252. And see that none were carried away too small?—Yes; the inspector, whoever he was, should be informed when a cargo was about to be shipped, and should go and inspect it.

23,253. Would you provide him with an oyster gauge?—Yes.

23,254. What size would you have the gauge?—He would soon be able to tell what the proper size should be by his own eye independent of the gauge.

23,255. What would be the smallest size of oyster that you would allow to be exported?—The gauge which has been in use here hitherto has been much too large; it has been too large by a third quite.

23,256. This gauge is about two inches and a half in diameter?—Yes.

23,257. And you think that that is too large?—Yes, I think so.

23,258. How much smaller would you make it?—I think if it were a third smaller it would do.

23,259. A third smaller than this?—Yes.

23,260. You would prohibit the exportation of any oysters that would go through a gauge a third smaller than this?—Yes, I would.

23,261. Do you think that that would effectually prevent the wasteful fishing of which you complain?—I think it would in a great measure.

23,262. Is there anything else that you have to suggest to us?—I do not think there is.

23,263. (*Mr. Lefevre.*) What is the smallest oyster you yourself carry away to lay down on your beds; is it half the size of this (*holding up a small oyster*)?—No, that is quite small enough to carry away. Our only desire is to keep them till they get to a proper size, and that we can do by keeping them for the time I have specified.

23,264. Then you do not want to purchase any oysters smaller than that?—No, that is quite small enough.

23,265. Do you find it unprofitable to purchase them smaller?—If we were to purchase them smaller we should have to allow them to remain another year, and they would occupy the ground unprofitably.

23,266. You mean that they would take the place of larger oysters?—Yes.

23,267. But still they grow very quickly on the beds?—Yes, they grow very quickly, but there is a great deal of waste; there is a great deal of death at times.

23,268. Is not that much the same at the bottom of the harbour?—Perhaps they may not be destroyed to such an extent in our beds as in the harbour. We take all the care of them we can.

23,269. I think one of your objections was that the larger oysters, when carried away at a certain season, took with them a large number of small ones attached to them?—Yes, they are brought up fast to the large oysters. The dredger-men, and particularly the country dredger-men, will not handle the oysters properly.

23,270. Would you have an inspector to see that no small oysters were carried away fast to the large ones?—I do not attach so much importance to that as to the other point.

23,271. What other point?—I think the inspector should see that no oysters were carried away under a certain size.

23,272. I understood one of your objections to be that many of the large oysters were carried away with a great number of small ones attached to them?—Yes, that is so; the spat is frequently found on the large oysters, and it ought to be taken off in a very careful manner before the oysters are taken away.

23,273. How would you have that done, would you have the inspector object to all the oysters that have spat attached to them?—If the spat were on the shells he ought to object.

23,274. You would have the inspector object to all the oysters that were in that condition?—Yes.

23,275. But have not the greater number of these oysters spat in that condition adhering to them?—A good many of them have, but not all.

23,276. But the greater number have?—No doubt it is on a good many.

23,277. Would it be possible to scrape them off?—Yes, I think so, unless they were very small indeed, and very young and tender.

23,278. But would not that increase the price you pay for the dredging of oysters?—A man is taught to do things very quick in dredging. He must handle the oysters very quickly or he would not get much out of them.

23,279. Then he would hardly have time to scrape off the young spat?—They are very easily rinsed off.

23,280. Do you not lay down a good number of oysters on your beds with spat attached to them?—No.

23,281. Who scrapes off the spat?—The men who dredge them.

23,282. They scrape off the spat?—Yes.

23,283. Before they are laid down on the beds?—Yes, before the oysters are brought ashore.

FALMOUTH.

J. Mayne.

30 Mar. 1864.

23,284. They scrape it off directly the oysters are taken up?—Yes.

23,285. Then why do they not do the same in the case of the oysters they dredge for sale and sell to the people who carry them away to a distance?—I think our dredger-men would do so, but the country dredgermen are not so careful or so particular as our own dredger-men.

23,286. Do you think it is the dredger-men from a distance who do not dredge them in a proper and careful manner?—They have certainly brought in a new mode of dredging here.

23,287. Are there any dredger-men who are in the habit of scraping off the spat from the oysters?—I believe there are many of our own men who are very careful.

23,288. And they are in the habit of scraping off the spat from the oysters?—They are in the habit of cleaning off the extraneous matter. All of them ought to do so, but whether they do or not is another question.

23,289. (*Professor Huxley.*) Did you ever notice the oysters on the oyster beds in a spawning condition?—Yes.

23,290. Do they come to a spawning condition on your oyster beds within tide-marks?—Yes.

23,291. That is a point that has been a good deal disputed?—I think if you open them you will find a great many of them with spat in them.

23,292. Then the oysters on your spawning beds will be as much out of condition in May, June, and July as the oysters on the beds in the harbour?—No doubt they become so as the weather gets warm.

23,293. Is it an advantage to have oysters on your beds of a smaller size than this (*exhibiting a small oyster*)?—No, not smaller than that.

23,294. Then there would be no objection at all to the dredger-men employed in taking oysters from the natural beds to your beds being under the same conditions and restrictions as those employed in dredging oysters to be carried away; I mean if they get up oysters of too small a size they should be prosecuted also?—Yes.

23,295. You are of opinion that that would not interfere with your interests?—I do not think it would.

23,296. Then if a man employed in dredging oysters for your beds were found with oysters of too small a size in his possession you would have no objection to their confiscation?—No, I should not object to that.

23,297. You think it would not interfere with your interests?—No, not at all.

23,298. (*Mr. Lefevre.*) You stated some time ago that the oysters had diminished to a certain extent in the harbour?—Yes; I believe you imagined when I said half a tub I meant half the quantity.

23,299. I thought you said the quantity had diminished one-half?—No; what I meant to say was that it had come down to half a tub.

23,300. What was the catch originally?—From eight to 10 or 12 tubs a day.

23,301. How many dredgers were there employed then?—Two men.

23,302. Only two men in the whole harbour?—Two men in a boat.

23,303. How many were there in the whole harbour?—I can hardly say. That continued over a space of 25 or 30 years.

23,304. Can you give me an idea of the total number of men employed then in dredging?—No, in the first place there were very few.

23,305. But how many were there?—As the oysters became more in demand more boats were sent out.

23,306. That is not what I want to know. I want to know how many there were employed in dredging at that time?—When I first commenced I was the only one here, and I believe I was the only one here for some years.

23,307. How long is that ago?—About 48 years.

23,308. How many were there about 20 years ago?—By that time they began to multiply very fast.

23,309. How many were there?—I cannot say.

The witness withdrew.

J. Hughes.

JOHN HUGHES called and examined.

23,310. (*Professor Huxley.*) You are Collector of Customs here, I believe?—Yes, I am.

23,311. Have you been so for any considerable number of years?—I have been in that position for four years and a quarter.

23,312. Then you are thoroughly acquainted with all the regulations affecting the fishing with which the Customs have anything to do?—Yes.

23,313. Are there any local Acts here to regulate the fisheries?—I am not aware of any existing at the present time. I believe that some years ago there was a local Act regulating the pilchard fishery but I do not think that it remained in operation after the Convention Act was passed.

23,314. Has the duchy of Cornwall any power here?—Under the old pilchard fishery Act I think there was something of the kind, but I have had no communication with the duchy on the matter.

23,315. Will you be kind enough to inform us what your instructions are relating to the fisheries here?—I have only the regulations of the Convention Act. Perhaps I had better enumerate the representations which have been made to me as matters of complaint.

23,316. If you please.—I think the first complaint I had was in January 1863. That came from the Coastguard and had reference to the fisheries here. It was made by Mr. May, the chief officer of the Coastguard at St. Mawes, and related to the seines employed on the coast.

23,317. What was the nature of the complaint?—He complained that the meshes were too small. He made a special complaint in writing, which I forwarded to the Board of Trade.

23,318. That complaint was in reference to the seines?—Yes; the answer of the Board of Trade to me conveyed the opinion of Mr. Rickards the counsel employed for this purpose. The Act an infringement of which was complained of was the Act of George I. chapter 18, which states the size of the meshes that are to be employed in the seine-fishing. I was referred to that Act by the Board of Trade for my information, but they did not send the Act to me. With very great difficulty I succeeded in getting hold of a copy of the Act of Parliament, and on referring to it I found that one of the sections laid down the size of the meshes which was permissible for seine-fishing.

23,319. What size was it?—It must not be less than $3\frac{1}{2}$ inches from knot to knot.

23,320. That is laid down by the Act of George I.?—Yes, by the Act of George I. Nothing further was done in the matter, but previously when I was at the port of Dartmouth I had a great deal of communication with the Board of Trade upon matters connected with the fisheries, but I never received any instructions to prosecute.

23,321. The Board of Trade did not think proper to instruct you to prosecute under this old Act?—Certainly not.

23,322. A seine-net the meshes of which were $3\frac{1}{2}$ inches from knot to knot would not catch many of the fish they are catching here?—It would catch none whatever.

23,323. Did the Board of Trade intimate to you that you ought not to proceed in the matter?—Yes.

23,324. Then practically the Act is inoperative as far as the Government are concerned?—Yes.

23,325. Were there any other cases in which complaints were made?—As regards the oyster fishery I have had repeated complaints.

23,326-7. What has been the nature of the complaints?—There have been complaints of the infringement of the regulations, principally referring to the scale or size at which the oysters were taken. By the regulations laid down they ought not to be taken under 2½ inches. That is the size of the gauge here. It has been repeatedly stated to me by Mr. Mayne, who has already been examined here, and by others, that oysters are caught under the legal size. The Coast-guard on one or two occasions have brought several tubs of oysters for my inspection. The oysters brought to me were about the size of those now before you; many of them were smaller. They were desirous that I should prosecute the persons who had taken them. A considerable number of them came from the neighbourhood of Colchester and other places. I communicated the whole matter to the Board of Trade and received the following letter in reply:

Office of Committee of Privy Council for Trade,
Sir, Whitehall, Sept. 16, 1863.

In reply to your letter of the 4th instant, relative to the oyster fishery in Falmouth Harbour, and requesting to be informed whether persons who infringe the fisheries' regulations by removing the small oysters from the beds should not be proceeded against, I am directed by the Lords of the Committee of Privy Council for Trade to inform you that my Lords are not prepared to recommend the adoption of legal measures in such a case as that to which you refer.

There appears to be great doubts as to the meaning of the Acts by which the oyster fisheries are regulated, and as to their application to such a case as this.

I am, &c.
The Collector of Customs, Falmouth. T. H. Farrer.

23,328. What did you do on the receipt of that letter?—Before I proceeded to communicate with the Board of Trade at all I told these men that they were evidently contravening the Act of Parliament, and were liable to prosecution. I took their names down and the particulars of their infringement of the Act, so that in the event of a prosecution being directed I should be able to find them. I communicated the facts to the Board of Trade, and the result was that I received that letter, and nothing was done.

23,329. Was it that the opinion of the law officers was such that it was not quite certain how the Act of Parliament was to be applied?—Yes, there was a difference of opinion; but perhaps you are aware of the order of council of May 1857, relative to the removal of oysters on private beds. We enforce that fully here.

23,330. What is the nature of that regulation?—It is this: that no owner of any private fishery whatever shall be allowed to remove his oysters from one bed to another without a licence from the collector of Customs authorizing him to do so. Then, again, no dredge of any kind is allowed to be employed in the port for the taking of oysters during the close months. During the close months no person is allowed under any circumstances to remove his oysters unless he has received a special licence from the collector of Customs directing him where he is to remove them, and even then he is not allowed to take them out of the port under any circumstances, except he receives another special licence, authorizing them to be removed, under a bond, to another part of the coast.

23,331. Are those restrictions strictly enforced now?—Yes.

23,332. (*Mr. Lefevre.*) You do not allow any oysters to be removed from any part of the beds?—No, except under a special licence, and if they are removed from the port they require a further licence, and they give me a bond, under a penalty of 100*l.*, to satisfy me that they shall not be removed to any other place than the place to which they are licensed to remove them. For instance, if they have a licence granted them to remove them to Shoreham or Rochester they give this bond, and when I receive notice that the law has been complied with, and that the oysters have really been laid down on the beds to which they were authorized to remove them, the bond is cancelled.

23,333. (*Professor Huxley.*) Do you grant licences in that way?—Yes.

23,334. To how many people do you grant them?—They are not numerous, there are only four or five or six licences granted in the course of a year.

23,335. Have you had any complaints that that regulation has operated harshly or injuriously to the interests of the fishermen or others engaged in the oyster trade?—No; on the contrary, I should say that these regulations have been found to be exceedingly beneficial.

23,336. You are not aware that any complaints have been made?—No. If there have been instances in which persons have dredged oysters during the open months, and have not been able to carry them away before the close months came on, I have invariably allowed them to take them away. I have known such instances as this: a man has brought oysters from Ireland with the intention of taking them to Rochester, but owing to the weather and the length of the voyage he has been obliged to deposit them in our harbour here, in order to keep them alive. When he wanted to ship them again the close months might be on, and I have always allowed him, under those circumstances, to take them away.

23,337. Under what circumstances do you consider that you would be justified in refusing a licence?—I have never had an instance of the kind. I should never refuse a licence under the operation of the order in council, so long as the fishermen complied with the order in council.

23,338. Would you have power to refuse in such a case?—I think not.

23,339. You have no discretion?—No.

23,340. Are there any other regulations that affect the fisheries here with which you have to deal?—I am not aware that there are. We have only four or five trawlers here, but I may say that so far as they are concerned the regulations of the convention are entirely inoperative. I have found that out at Brixham and elsewhere. The Act of Parliament has never been put into operation. The regulation with regard to the size of the beams is probably an absurdity, but as regards the size of the mesh of the net, that is also constantly infringed. I have specimens here of the size of the nets used by the Brixham trawlers; this one (*producing one*), if it were wet, instead of being 1¾ inches from knot to knot on the line, would not be more than one inch.

23,342. (*Mr. Lefevre.*) What part of the net is that taken from?—From the cod of the net.

23,343. (*Professor Huxley.*) I understand from your evidence that you do not feel yourself bound to put in force any one of the regulations of the Convention?—No, except in relation to the fence months of the oyster fishery; that regulation is strictly enforced. I should feel bound, if I knew of any infringement of that regulation, to call the attention of the Government to it directly. There was an instance some time ago; a quantity of oysters were sent to Brest during the close months; I communicated the circumstance to Government, and in their reply they stated that on no account should it be allowed.

23,344. You are the authority in whom rests the enforcement of all the regulations of the Convention here?—Yes, but I could never institute a prosecution without directions from the Government.

23,345. If there are legal difficulties which prevent the Government from instituting a prosecution in any particular case, would not the same difficulties apply in all cases?—I do not know. I should be sorry to say that the whole of the Convention Act is inoperative. If the Government would put it in operation, I think it is operative within the three-mile limit. I am decidedly of that opinion. I have very good authority for saying so. There was an order in council, or rather a letter from the Privy Council, on the subject some time ago, in which it clearly stated

FALMOUTH.

J. Hughes.

30 Mar. 1864.

that the Act was operative within the three-mile limit.

23,346. Have you any herring-fishing from this port?—Not much; it is very uncertain; it is very seldom that they try for herrings here. There are very few that come to this port, and there is very little fishing for herring practised.

23,347. Are there any herring-nets possessed by the fishermen here?—I think so, but I am not competent to say. The men here will be able to give you better information on that subject. I think when they catch herrings they generally employ the pilchard-nets.

23,348. Did it ever occur to you to feel bound to examine the size of the mesh?—Never.

23,349. Are you aware that there is a regulation with regard to the size of the mesh?—Yes, but it is principally the duty of the Coastguard officers to attend to that. In the event of a prosecution being instituted under the Act they would be bound to come to me for instructions, but they look after these matters more than I do.

23,350. During the four years you have been here have you received any complaints from the Coastguard?—Yes, I have received repeated complaints; the two cases I have already referred to come from the Coastguard.

23,351. Have you ever received any complaint touching the size of the mesh of the herring-net?—No, never.

23,352. Did you ever receive a complaint from the Coastguard respecting the mode of working the drift-boats?—No, never.

23,353. Did you ever receive a complaint respecting the use of vanes by the trawlers?—Never.

23,354. You have received no complaint on any of these matters?—Not here, but I have at Brixham.

23,355. (*Mr. Lefevre.*) When did you have that gauge for the oysters made?—It was made before my time. I apprehend it was made before the Act passed.

23,356. Within your time has it been enforced here at all?—So far as this, that we have tried to ascertain whether we should prosecute for non-compliance with the regulation, and we were told that we should not.

23,357. Then there has been no attempt to enforce it in any way?—Yes, there have been several attempts made, but the Board of Trade will not prosecute.

23,358. No attempts actually to prosecute have been made here?—We have been unable to get the Government to support a prosecution. Perhaps I may be allowed to say that there was one principal question that operated with me and which I told the Board of Trade. It was this: what was the age of the oyster when it was taken? There was some difficulty in ascertaining whether it was really a young oyster or a full-grown oyster. If it were a full-grown oyster I do not see that there would be much harm in taking it, and I apprehend most of the people connected with the oyster fisheries here will tell you that the fish they eat in London would all of them go through this gauge.

23,359. (*Professor Huxley.*) You mean the native oysters?—Yes, the scale is very much too large for the native oyster.

23,360. How do you use the scale in practice?—We pass an oyster through it.

23,361. Which way?—Any way.

23,362. Any way?—Yes, I apprehend that that is so.

23,363. That is not the Convention. The Convention says, "The fishermen shall cull the oysters on the "fishing ground, and shall immediately throw back "into the sea all oysters less than two and half inches "in the greatest diameter of the shell, and also all "sand, gravel, and fragments of shells"?—Exactly so.

23,364. If you take one of these oysters vertically, one twice the size would go through?—Yes.

23,365. You see from this article of the Convention that they are bound to pass it through the gauge at the greatest diameter of the shell. If you attempt to pass it through any other way you would not comply with the Act?—Yes, but I should say that one-third of the oysters I have seen are less than that.

23,366. (*Mr. Lefevre.*) Do you mean one-third of the full-grown oysters?—Some of them are very large here. The size of the oysters depends, I apprehend, on the age of the ground, the number of years the ground has been unploughed or fished. You will find that the oysters regularly cultivated are not nearly as large as those which are not regularly cultivated.

23,367. In your opinion would it be beneficial to the oyster trade if this gauge was strictly enforced?—With regard to oyster fisheries, I am of opinion that it is desirable at all times to take care that there should be fence months. Above all things in the world that regulation should be enforced, and the fishermen should not be allowed to take an oyster except during the open months. At the same time there is a difference of opinion among the people who are interested in the cultivation of oysters as to the months which should be selected for fence months. Some believe that it would be better to keep the month of April a close month, and open the month of August.

23,368. Would the fence months depend on the spawning season?—Yes; I think it does depend on the spawning season whether the months now established are the best or not, but that is a point on which I am not competent to give information. At the same time I think it would be exceedingly unwise to allow the indiscriminate fishing of oysters all through the year.

23,369. Do you think that would be objectionable during the open months?—Yes, at any time. That guage I think is a great deal too large.

23,370. (*Professor Huxley.*) You think it would be too large if you passed the oysters through in the way contemplated by the Act?—Yes, I still think it would be too large. Those oysters you have there would all pass through.

23,371. A very large oyster would pass through one way?—Yes, but the question in my mind would be what is the age of that oyster? If it were an oyster of full age, whether it would pass through or not I do not think would make much difference. There could be no objection to taking an oyster of that description; but if you are taking an oyster under growth and too small, that I think would do injury to the fishery, and I think there should be some restriction to prevent that from being done.

23,372. (*Mr. Lefevre.*) You told us that you have granted licences during the fence months to certain people to remove oysters?—Yes.

23,373. Have those licences been granted only to people who have beds here?—They have been granted to the people who have beds.

23,374. You do not allow them to dredge oysters during the close months?—No the licence only relates to their removal from one bed to another. As Mr. Mayne explained in his evidence there is a large patch of ground in the neighbourhood here. One man will have a bed upon it of four or five acres, and stones are put down to show the limit of his bed, and if he wishes to remove the oysters from one bed to another he applies to me for a licence.

23,375. You do not allow anybody to dredge oysters during that time?—No; no person whatever is allowed to dredge oysters during the close months.

23,376. Is there a large proportion of ground fit for converting into beds here?—I fancy that there is.

23,377. Is there more than is in use at present?—Yes; I think not only here but at St. Mawes and upon the Fal, considerably up the river.

The witness withdrew.

WILLIAM HENRY WILLIAMSON called and examined.

FALMOUTH.

W. H. Williamson.

30 Mar. 1864.

23,379. (*Professor Huxley.*) I believe you are an oyster merchant here?—Yes.

23,380. Have you been engaged here as an oyster merchant for many years?—Yes, for many years.

23,381. For how many years?—For the last 10 or 12 years.

23,382. Is it your opinion that the supply of oysters has fallen off?—Yes, I think it has fallen off very greatly.

23,383. Has the price you are obliged to pay to the dredgers increased?—Yes.

23,384. Is the increase very much?—Yes, we have to pay now five times as much as we did formerly.

23,385. Do you purchase directly from the dredgers, or from those who possess beds here?—I purchase from both. I purchase some direct from the dredgers, and others from what we call second men, such as Mr. Mayne, Mr. Hill, and so on.

23,386. Which do you prefer?—I would as soon purchase of the dredgers. Perhaps altogether I would rather take the oysters from them.

23,387. Are the oysters when they come out of the water in as good a condition as they are after they have been laid for some time on the beds?—You mean what we call the seconds. The fresh caught are equally as good as the seconds in my opinion.

23,388. Are the first class oysters any better by lying on these private grounds for a short time?—Yes.

23,389. Then they get a higher price for those than they would be able to get for oysters of any kind newly dredged?—Yes.

23,390. You say the price has greatly increased?—Yes.

23,391. Can you state what the increase has been?—It has increased in my time from 2*s.* to 18*s.*

23,392. Has that been in consequence of the increasing scarcity of oysters?—Yes, I think so.

23,393. And what do you think is the reason of that scarcity?—I think it has arisen from dredging the small oysters and taking them away to different beds, whence they are again taken away and deposited on other beds. I think great injury has been done by removing the small oysters from the natural beds in order to lay them down on such beds as those at Flushing and St. Mawes.

23,394. Do you think they would be better if they were allowed to remain on their natural beds?—Yes, I do.

23,395. Then you are of opinion that those who possess private oyster beds do harm?—Yes; they do harm by taking the brood and the spat shells. I think it is very injurious to take them off the ground at all in that way.

23,396. Do the people who bring oysters to you directly from the oyster beds take pains to cleanse the oysters from spat, young shells, and the like?—Not so much as they ought to do.

23,397. Do they take more or less pains than those who dredge them for the purpose of laying them down on private beds?—In my opinion one does as much harm as the other.

23,398. (*Mr. Lefevre.*) Then you do not agree with the evidence of Mr. Mayne?—Not at all.

23,399. Do you buy the oysters for sale or for laying them down at Colchester?—I buy them for laying down, not at Colchester, but at Queenborough in Kent. I have beds there.

23,400. (*Professor Huxley.*) Do you think it would be expedient to put any check on the dredging up of oysters as now practised?—Yes.

23,401. What kind of check would you impose?—I would take the month of September off.

23,402. Do you mean that you would take the month of September off the close time?—No, I would take it off the dredging time.

23,403. Then you would add one month more to the close time?—Yes.

23,404. Why would you do that?—Because I think that at that time the spat is not sufficiently strong to bear the dredging which is carried on all over the grounds. The dredge goes over it and destroys it In my opinion the working of the dredge in that month kills the spat, and that is the reason the spat has fallen off so much of late. When they are dredging they drag up a great deal of culsh from the ground where the spat is, and it is not sufficiently strong to stand the wear and the chafe of the dredge. In my opinion it is that and nothing else that kills a very large portion of the spat.

23,405. Would you keep May still as a fence month?—Yes.

23,406. Then you would increase the period of close time?—Yes, I would only have seven months instead of eight in this harbour for dredging.

23,407. Do you think that under these circumstances you would not carry away any great quantity of the small oysters?—There would not be so much destroyed as is destroyed at present, and the small brood would have more time to get strength, so as to bear dredging over it, and I believe we should eventually greatly increase the quantity of oysters in the harbour.

23,408. But if the dredgers were not more careful in dredging would they not do as much mischief as they do now?—I think there ought to be a check put upon them. I would fine them for all the oysters they brought in under a certain size.

23,409. How would you have the oyster cargoes inspected?—I would have them inspected by the Coastguard when the dredger-men came in.

23,410. Could they sufficiently inspect the number of boatloads of oysters when they come in in considerable numbers?—I would put the Coastguard at such places where the oysters are taken, and they should inspect the oysters as they are sent in. But that gauge would be of no use; it was never made for this harbour, but it was made for Jersey and Guernsey, the Channel Islands, and the Isle of Wight, where the oysters grow much larger. Our oysters here are of a peculiar kind.

23,411. Are they a small oyster?—Yes; they resemble a native in the shell more than any other oyster I know.

23,412. Then you think this gauge is too large for the oysters if the oysters are to be taken right away?—Yes; such oysters as this would be fit for us to remove and cleanse and purify for the market next year. In point of fact they are the sort of oysters our merchants want to buy chiefly.

23,413. Do you think that the gauge should be so diminished that smaller oysters than this would not pass through?—Yes; I would not allow smaller oysters than those to be brought into this port at any time under a fine.

23,414. How many boatloads are brought to the quay in the season?—We take them both of the dredger-men direct and also of the second men.

23,415. How many boatloads altogether?—Sometimes 50 or 60 boatloads in a day.

23,416. Do you take as much as that for yourself alone?—Yes, I have sent in one season more than 18,000 bushels.

23,417. And many others would be doing the same thing?—I believe I was the top merchant that year, and I have sent away as many since.

23,418. How many other merchants would there be?—There was one who sent as many as myself, Mr. Wilson.

23,419. Then would you have 100 boatloads a-day?—Yes, sometimes we had more and sometimes less.

23,420. Would you sometimes have as many as 70 boatloads?—Yes, we buy of Mr. Mayne, and Mr. Hill, and Mr. Dash, and others. We also buy them of the dredger-men. We buy what we call second-handed.

23,421. How many boatloads are you getting now?—I had 20 on Saturday, I may perhaps have 40 some days.

FALMOUTH.

W. H. Williamson.

30 Mar. 1864.

23,422. Would it not take some trouble to have so many boatloads properly inspected?—I do not see any difficulty. The Coastguard are always round here, and if they saw any small among the others they should make the people cull them over.

23,423. Would not that so retard the loading of the boats as to increase the price to you?—Not at all. I should be quite willing to submit to all the increased price that would be occasioned.

23,424. Then do you think that the advantage arising to the fishery would compensate for any increased price?—Yes, I think so; there would be a great advantage to the fishery. The spat, I may say, is chiefly on shells and not on the oysters at all.

23,425. On dead shells?—Yes.

23,426. Is there anything else that occurs to you to suggest to us?—I do not know that there is anything more. I have put down a few memoranda here in writing [*handing in a paper*].

23,427. I see you have already given us in your evidence the suggestions you make here. You propose to take off the month of September, you also propose to decrease the size of the gauge and make it 2 inches instead of $2\frac{1}{2}$?—Yes.

23,428. (*Mr. Lefevre.*) How many men are there engaged in the dredging?—In some seasons there will be from 300 to 400.

23,429. Two in a boat?—Sometimes there will be four; in a sailing-boat there will be four.

23,430. Has the number fallen off during the last year or two?—No, it has increased. Owing to the scarceness of oysters in other places the dredger-men have flocked here in order to get a living.

23,431. Has the quantity taken been smaller than in previous years?—Yes, the quantity taken here has been much less than in former years.

23,432. Then the price has increased accordingly?—Yes, it has increased very much.

23,433. Do you think that the failure in the supply of oysters here is in any way due to bad spat?—It may be in consequence of that to a certain extent, during the last four years.

23,434. That is said to have been the cause of the falling off on the east coast?—Yes, there has been no good spat anywhere.

23,435. Previous to the last four years was there any diminution in the supply of oysters here?—None at all; there were more here than was wanted for the market before then.

23,436. Then in your opinion is not the diminution due to bad spat and not to over-fishing?—No doubt the spat has had a good deal to do with it, together with the shipping away to foreign parts. I think something ought to be done to prevent that. The English oyster ground will not supply two nations.

23,437. Has the falling off in the supply which you said has taken place during the last four years been mainly owing to the diminution of spat, to destructive modes of fishing, or to over-fishing?—There has been a diminution of spat, but still there has been a good deal of spat here.

23,438. You have not had the average amount of spat you have had in former years?—No, we have certainly not had the average amount of spat we had formerly.

23,439. Then in Falmouth it has been the same as in all the ports on the east coast, namely, there has been a falling off in the spat?—Yes.

23,440. Is not the increased price of the oysters mainly due to that?—Perhaps so; there has been a scarcity in all parts, whether Essex, or Jersey, or here; in point of fact there is none in Jersey at all now.

23,441. What number of men were employed in the oyster-fishing here four years ago?—Not so many as are employed now.

23,442. What was the price of the oysters then?—Four years ago they would be perhaps at 2*s.* 6*d.* a tub.

23,443. A tub is a bushel?—Yes.

23,444. And now you say it is 18*s.* a tub?—Yes.

23,445. I understand from your evidence that you are mainly employed in buying oysters for the purpose of sending them to the east coast?—They are all my own beds there that I send them to. I buy for the market.

23,446. Where have you beds?—At Shoreham, at Southwick, and at Queenborough. I have also one on the Isle of Wight, and others at Westport in Ireland. I have agents who buy for me in Arklow. In point of fact I procure oysters from all parts of the kingdom.

23,447. But your places of deposit are mainly on the coast of Kent and Sussex?—Yes.

23,448. How long have you laid down oysters in those places?—I have laid them down in Sussex for the last 12 or 13 years.

23,449. For what length of time do you lay them down?—Sometimes for four, eight, or ten weeks. Then I collect them and shift them again to the feeding beds.

23,450. How long is it before they would be ready for sale?—Perhaps eight or nine months.

23,451. At the end of that time what price will they fetch?—From 22*s.* to 24*s.* in the London market.

23,452. Do they fetch a larger price than the oysters sold off the beds here?—Generally they do after we have fed them and cleaned them.

23,453. Are they better feeding grounds?—Yes, and they are more extensive.

23,454–5. Do you recollect the fishing here before the fence time was introduced?—Not much of it. The fence time was introduced about the year 1851, I believe.

23,456. What was the price of oysters when you first recollect the fishing?—I have known the people here buy them as low as 10*d.* a tub.

23,457. Was that an average price?—No, it was the price that existed when I first came here. It soon rose. In point of fact directly a merchant comes to a place like this the price always rises.

23,458. What was the price then directly after you came here?—It rose to 2*s.* and 2*s.* 6*d.* a tub.

23,459. Then the price remained steady until the last four years?—Yes.

23,460. And I understand you to say there has been an increase in the time of dredging, and a diminution in the quantity of oysters?—Yes, every year.

23,461. (*Professor Huxley.*) Have you ever tried the artificial feeding of oysters?—Yes, I tried it on one occasion for the Duke of Northumberland.

23,462. How did you find it answer?—It did not answer at all. I spent about 1,600*l.* over it and lost it all for him.

23,463. You spent that sum in the artificial feeding of oysters?—No, not in the artificial feeding, but in the artificial breeding of oysters.

23,464. Then you never tried artificial feeding?—No.

23,465. (*Mr. Lefevre.*) Are there many cargoes of oysters lost between this place and Kent and Sussex?—I lost one on the Goodwin Sands once, that is all I ever lost.

23,466. What kind of vessels do you employ in conveying the oysters from this port to Kent?—They are principally of from 70 tons down to 30 and 40.

23,467. Have they wells in them?—No.

23,468. Then are the oysters kept dry?—Yes.

23,469. Do you not lose a large proportion in that way?—No; if we can get them up in seven or eight days they are got up in very good order. We like to get them up in about four days if we can, but if we got them up in seven days they will not be hurt unless the weather is very hot.

23,470. Are the beds upon which you lay the oysters at Queenborough private property?—Yes, they are private property granted by charter.

23,471. Are there any private beds here?—There are none here of a similar description. There are no private beds here, I believe.

23,472. There is no exclusive right of fishing here?—None at all, I believe.

FALMOUTH.

W. H. Williamson.

30 Mar. 1864.

23,473. Can you say what proportion of the oysters you send away is covered with spat?—As a general rule there is not one in a thousand oysters that is covered with spat. I have not seen spat on an average this season on one out of a thousand.

23,474. Then none of the oysters would have that small spat upon them which has been described?—Not one in a thousand.

23,475. Then you do not think the loss to the beds here in that way is very considerable?—Not by taking the oysters. My opinion is, that it is the bringing up of the spat-shells that does the injury.

23,476. It would not be a difficult matter to throw the spat-shells overboard?—Not at all; they ought to throw the young brood overboard.

23,477. Then, in your opinion, it would not be necessary to have an inspector to examine a cargo of oysters before they are sent away?—After we have purchased them we consider them merchandise. If anything is to be done to them at all it should be done when the fishermen are delivering them. After we have paid 13*s.* or 14*s.* a tub for them we consider them merchandise and our private property.

23,478. (*Professor Huxley.*) You spoke just now of some method of artificial breeding, what was it you referred to?—We tried it for the Duke of Northumberland by the employment of bushes on M. Coste's plan. I got a letter of introduction to see him in Paris. We made ponds and threw down branches, and so on, but it turned out to be useless and an utter failure.

23,479. Would not the spat adhere?—It adhered, but it would not live on the wood. We got some not as big as your finger-nail, but they all died off.

23,480. Did you put bushes down within the tide-marks?—No, on little reservoirs purposely constructed.

23,481. And you found that the whole thing broke down?—Yes.

23,482. (*Mr. Lefevre.*) Are any of your private beds breeding grounds?—Not at all; we buy them and lay them down for a short time before we take them to the market. Ours are merely feeding grounds. Still there are Kentish people who do breed. Our beds are some miles in extent.

The witness withdrew.

Frederick Andrews called and examined.

F. Andrews.

23,485. (*Professor Huxley.*) You belong to St. Mawes, I believe?—Yes.

23,486. Are you a dredger there?—No, I am a pilot, and I am connected with the fisheries a little.

23,487. Are you practically acquainted with the oyster-fishing?—Not very intimately, but there was a meeting convened yesterday at St. Mawes of some of the fishermen, and the result of that meeting I have been requested to lay before you.

23,488. Was that a meeting of oyster-dredgers?—Yes, and I believe that some of them are now present.

23,489. Have they come to any general agreement on the subject?—There were a few things suggested which they approved of, and they were put down in writing.

23,490. Will you be good enough to let us know what they are?—Perhaps I had better read this document.

23,491. Yes.—They say, "With regard to the "oyster fishery it is resolved, that four months, from "the 1st November to the 1st March, is considered "sufficient for this port for dredging for oysters, but "it should not exceed the last day of March."

23,492. They are of opinion that oyster dredging should stop at the end of March?—Yes.

23,493. Then they are inclined to diminish the open months during which you are now allowed by law to dredge?—Yes; they go on to say, "That no boat "should be allowed to carry more than one dredge, or "at most two, as at the Mumbles in Wales; that the "present law respecting small oysters be looked after "by a proper person to be appointed, but that the "ring might be reduced to two inches, because some "oysters when full grown do not reach that size. "That with regard to the drift pilchard fishery the "law should be carried out for the protection of the "seine fishery in the bay, which of late years has "been very much injured, and that the trawlers should "be kept one league from the land."

23,494. They propose to keep the drift-men outside?—Yes.

23,495. How do they hurt the oyster fishery?—This has no reference to the oysters, but to the pilchard fishery. They go on to say that "All ground-"seines should be six meshes to the foot."

23,496. Is that from knot to knot?—It would be two inches from knot to knot. They continue as follows: "At present there is a large quantity of "small fish of all kinds destroyed by the small meshes. "The ground-nets (commonly called ebbing nets) "destroy all small fish, soles and flat-fish especially, "and in the opinion of this meeting they should be "discontinued altogether, so that the young fish "might proceed to sea."

23,497. They speak there of ebbing nets?—Yes, there are four or five different sorts of fishing carried on at St. Mawes. There are parties here to answer any question you may wish to put to them. They go on to say in this document, "Crabs should not be "taken under six inches, shes five inches, lobsters nine "inches, craws 11 inches, and that all caught under "that size should be again thrown into the sea."

23,498. Is that the whole of the document?—Yes.

23,499. Is the document signed by anybody?—Yes, it is signed by several of the fishermen. A gentleman connected with the navy also attended the meeting.

23,500. Were the statements contained in that document all agreed to by the fishermen there?—Yes, unanimously, and there were six persons delegated to attend here in order to give you any information you might desire to have from them.

23,501. Will you give me the name of any one of them?—John Odgers is here.

23,502. Do I rightly understand you to represent these men?—Yes.

23,503. Have you any wish to say anything yourself?—No.

23,504. Then perhaps we had better call John Odgers. Does he fairly represent the views of his friends who were present at the meeting?—Yes.

The witness withdrew.

John Odgers called and examined.

J. Odgers.

23,505. (*Professor Huxley.*) Are you a fisherman at St. Mawes?—Yes.

23,506. How long have you been a fisherman there?—I have been a fisherman there all my days.

23,507. How many years is that?—I have been a fisherman now for 50 years.

23,508–9. How many fishermen are there at St. Mawes?—I should think there are between 60 and 70.

23,510. How many were there when you first knew the place?—I think there were not more than 40 then.

23,511. Then the number has increased by about one-half?—Yes.

23,512. Has the number of boats increased?—Yes.

23,513. How many are there now?—I should think that there are fully 40.

FALMOUTH.
J. Odgers.
30 Mar. 1864.

23,514. What sort of boats are they, are they decked boats?—No.

23,515. Then they are undecked boats?—There is one about half-decked; it is decked to the mast, but there is only one in that condition.

23,516. What is the cost of each boat when it is rigged and fitted up ready for sea?—Each boat on the average would cost about 25*l*.

23,517. What is the principal mode of fishing practised at St. Mawes, what do they do there in the way of fishing?—I myself go crabbing in the summer season.

23,518. What other kind of fishing is there there?—Ground-seining; then they fish with the drawing-seine, and they also follow pilchard-driving, and mackerel-seining, and mackerel-driving, but there are no mackerel-drivers there at present.

23,519. Is there no pilchard-seining?—Yes.

23,520. Is there any herring-fishing?—A little, but not much.

23,521. Is there any line-fishing?—There is a little of that, but not much of late years. We have some herring-nets.

23,522. Have you any oyster-dredging?—Yes, dredging all through the winter.

23,523. You do not practise oyster-dredging?—Yes.

23,524. What size of dredge do you use, is it about the same they use here?—Yes, about 3½ feet.

23,525. Do you have a sail?—No; there are about three boats at St. Mawes that work under sail.

23,526. Then how do you work?—We have a winch in the fore part of the boat, and about 50 or 60 fathoms of rope on that winch. We have also a grapnel. We let it go, and then shove the boat astern, and put the dredges overboard and heave her ahead.

23,527. Then you are working up constantly to the winch?—Yes.

23,528. That is rather hard work, is it not?—Yes, but it is only like all other fishing.

23,529. Why do you not work under sail?—Because we believe that working under sail is the destruction of Falmouth Harbour.

23,530. Why do you think so?—Because the ground there will not stand the dredging under sail. Since sailing-dredging was introduced into Falmouth Harbour there has been a very great decrease in the quantity of oysters, and the ground has nearly all been destroyed.

23,531. Do you use a different weight of dredge when you are working by hand?—No, the sailing-dredge, I think, is rather a little lighter.

23,532. Then what is the difference in the work of the two dredges?—The sailing-dredge is always heaving ahead. When we are working we work against the tide, and when our dredge is full we are made to stop. The men in charge of the dredge will tell us that it is full, but the sailing boat when it is sailing and coming down before the tide with a strong wind, whether the dredge is full or not full, would go till they draw the dredge in and pick out what they have got. Then, whether they are in the Channel or on the oyster banks, overboard goes the greater part of the culch. The consequence is that they commit a great destruction. They take up young oysters and culch from the oyster beds and throw them overboard in the Channel.

23,533. When you work up to your anchor you take out the young oysters and throw them overboard where you are?—Yes.

23,534. Whereas they forge ahead and throw it overboard anywhere?—Yes, and they destroy a great quantity. We have had a considerable number of those boats in Falmouth Harbour of late years, and now there are scarcely any oysters to be found in the harbour.

23,535. Do you not practise dredging under sail at St. Mawes at all?—Yes, there are a few vessels that do.

23,536. Is the mode you have described the old mode of fishing?—Yes.

23,537. I mean working by a winch?—Yes.

23,538. Was that the only mode practised when you were a boy?—Yes, and for many years after.

23,539. Then the people have dredged under sail since you began?—Yes.

23,540. Do they get more oysters than you?—Yes.

23,541. Then they make more money than you?—Yes; there was a portion of ground where we had the best and the greatest quantity of oysters. It was nearly a mile long; it was known to several men, but it has now been entirely destroyed, and there has not been one oyster obtained there for the last 20 years past.

23,542. To what cause do you attribute that?—We do not know what the cause is, we can only guess. We believe it arose from the dredging of those vessels which came down here from Exeter in April, May, and June, when we had no Act of Parliament. They came dredging there, and the ground was so much torn up that the beds were entirely destroyed. There is nothing to be found upon them now. It has been swept as clean as this table, and there has not been anything upon it for the last 20 years.

23,543. Then would you like to see dredging under sail put an end to?—Yes, I should like to see that very much.

23,544. You would like to see all the dredging done by the warp?—Yes, and I believe if that were so there would be no injury done to the oysters in our harbour.

23,545. Do you agree with the statement contained in that document which was read just now, and which professes to embody the opinions of the persons who were present at the meeting at St. Mawes?—Yes.

23,546. You attended that meeting, did you not?—Yes.

23,547. And you agree in all that is contained in that document?—Yes.

23,548. Do all the fishermen at St. Mawes agree with it?—I cannot say that all agree with it, because all were not there. I rather believe that there are a few who are against it, and I will tell you what their opposition is. They want to put in October as the month for beginning to dredge instead of November, and that is the only opposition which has been raised in St. Mawes among any of our fishermen. They agree in everything, with this exception, that they want to add October month to the dredging months. They say that if you think proper to cut off March they are quite willing to assent to that.

23,549. Then still they would not mind having the fence months a little longer than they are now?—No, they wish it, every man engaged in the oyster fishery wishes it.

23,550. They wish to have the fence months extended through September to October?—The Act already extends them to September, but they think that September should be cut off by all means. I myself believe that a great portion of the spawn and spat cast in Falmouth Harbour is destroyed there in the month of September. I know there are a good many fishermen who are in this room now who do not agree with me, and who are opposed to me in that opinion, but I can prove what I say.

23,551. You say that the spawn is deposited there in the month of September?—Yes.

23,552. September is not a fence month, is it?—No; but I think there ought to be no dredging in the month of September, and I would add September month to the other four.

23,552*a*. You are permitted to dredge in September now?—Yes, but we wish to have all dredging in that month stopped.

23,553. In point of fact you wish to have the fence months extended to October?—Yes; there are a few oyster fishermen in St. Mawes who wish to commence in the month of October, but there are some who do not wish to commence until November.

FALMOUTH.

J. Odgers.

30 Mar. 1864.

23,554. In all other points the fishermen at St. Mawes are generally agreed ?—Yes.

23,555. (*Mr. Lefevre.*) Do you recollect fishing here before the fence months were introduced ?—Yes, I suppose the fence time was introduced about 14 years ago, as near as I can recollect.

23,556. Was it as long ago as that ?—Yes.

23,557. In your opinion did it do any good when it was introduced in the fishing here ?—Certainly, I think it did; the oystering was beginning to fall off fast before it was introduced.

23,558. How many boats were there engaged in the fishing before that ?—I cannot tell exactly how many boats there were, but they were beginning to increase very fast, and they were working away in the harbour. The oysters were falling off rapidly, and I myself and others who were interested in the fishing made a complaint to Dr. Bowen, who is a friend of the fishermen, and who took our grievances up.

23,559. Have the boats increased since that time ?—Yes; Dr. Bowen made some interest with Sir Charles Lemon, who was a member of Parliament at that time, and he got a clause inserted in the Act for the regulation of Falmouth Harbour.

23,560. Do the weeds increase in your harbour during the fence months ?—Yes, the ground gets all covered over with weeds.

23,561. I presume that that was not the case formerly when there were no fence months ?—No, it was not.

23,562. Are you of opinion that the weeds do good to the fish ?—Yes, I think so.

23,563. Why do you arrive at that opinion ?—I think the oysters grow better, they are kept warmer.

23,564. Is there any accumulation of mud during that time ?—No, there is not any great accumulation of mud in the low part of our harbour.

23,565. What is the nature of the soil ?—It is a sandy small corally soil.

23,566. Is it hard or soft ?—It is a kind of hardish sand, but still it is not like the sand which you find on the shore, it is very different from that; it is more rough, and we call it a corally bottom.

The witness withdrew.

R. Hill.

Richard Hill called and examined.

23,567. (*Professor Huxley.*) Are you engaged in trawling here ?—Yes, I served my time to it.

23,568. How many years have you been engaged in trawling ?—For more than 50 now.

23,569. How many trawlers are there going out of this port ?—There are three now, there is one laid up.

23,570-1. What is the average tonnage of the trawlers ?—I believe there is one 23, one 32, and one 40 tons.

23,572. Where do you trawl ?—Six or eight miles off.

23,573. Do you go out every day and come back again the same day ?—No, worse luck, I have not been out last week at all.

23,574. But when the weather is favourable do you go out every day and come back again at night ?—Yes.

23,575. You do not stop out at sea for a week at a time ?—No.

23,576. You come in every night ?—Yes, generally.

23,577. Do you trawl all through the day ?—No, we have about a four or five hours haul.

23,578. Do you get plenty of fish ?—They are very scarce indeed now. I was out on Monday and caught one haul.

23,579. Have you caught less of late than you did in former years ?—That depends.

23,580. Do you think the quantity of fish has fallen off of late years ?—No; I have caught less fish years ago in the winter time than I can catch now.

23,581. What is the size of the beam of your trawl ?—It is 36 feet long.

23,582. You have it any length you like ?—No, it would not do if we had it too long.

23,583. Have all your boats a beam of the same length ?—No; one has a beam 40 feet long, another 36, and another 34.

23,584. Then does the length of the beam depend on the size of the boat ?—Yes.

23,585. But if you desired to have your beam 40 feet long could you have it that size ?—Yes, if we thought proper.

23,586. Would anybody meddle with you if you did so ?—I do not know that anybody would meddle with us.

23,587. Is there anything in your trawling of which you wish to complain ?—No.

23,588. Is there any regulation that affects your interest injuriously in any way ?—No; the tide-surveyor sometimes comes on board and looks at our catch.

23,589. Is your mesh of the right size ?—It is three inches from knot to knot in the small part.

23,590. Does he also look at your beam ?—No, he does not say anything about the size of the beam.

23,591. If you had a 40-feet beam do you think he would say anything to you ?—No; there is one boat in the port now that has a 40-feet beam.

23,592. (*Mr. Lefevre.*) Are there any oyster beds outside the harbour ?—I never heard tell of any.

23,593. Would you not discover them with your trawls if there were any ?—If there were any on the ground over which we trawl we should take them up. I have sometimes caught them in the harbour.

The witness withdrew.

A. Chard.

Arthur Chard called and examined.

23,594. (*Professor Huxley.*) Are you engaged in fishing here, Mr. Chard ?—I have been engaged in fishing here for a number of years, but I am not at present.

23,595-6. In what kind of fishing were you engaged ?—In trawling principally, and in mackerel-fishing and pilchard-fishing. I deal in oysters now, but I take no part in the catching of them.

23,597. You have heard the evidence given by the witnesses who have already been examined, is there anything that occurs to you that you would wish to add ?—The only plan which in my opinion we could adopt for the preservation of the oyster fishery is to extend the close months. I do not see that any other method can be adopted that would be equally beneficial.

23,598. Then I gather from that that you are of the same opinion as the other witnesses that the oyster fishery here is falling off ?—Yes, I have no doubt of it.

23,599. And do you believe that that is owing to a wasteful mode of fishing ?—I believe that it is.

23,600. Then your first proposition is to extend the fence months ?—Yes, I think that is the principal thing that ought to be done for the preservation of the fishery.

23,601. How far would you extend them ?—I would extend them a month in each quarter.

23,602. Then by that means you would provide six close months instead of four, as at present ?—Yes.

23,603. What months would you cut off for the dredging ?—I would add the month of September to the close months.

23,604. And also April ?—Yes, and by so doing I think I should materially benefit the fishermen themselves. I would even go so far as to extend it two

FALMOUTH.
A. Chard.
30 Mar. 1864.

months more. I think it would be greatly for the benefit of the oysters, but it might interfere with the interests of the fishermen, as it would prevent them fishing for so long a period. I think the oysters would be greatly better for even two months more of close time.

23,605. But would not any regulation that was for the benefit of the oysters benefit the fishermen in the long run?—Yes, perhaps it would. No doubt it would eventually, but it would exclude them from fishing for a great length of time. I do not think that catching the proper eating oysters, that is, oysters that are fed to eat, would at all spoil the spat. I think the spat is all upon the fish that are not marketable.

23,606. You do not think that there is any spat on the marketable oysters?—No.

23,607. You think the gauge used here for regulating the size of the oysters that are to be taken is too large?—Yes, it is too large. Will you allow me to see one of those small oysters which have been shewn to you (*several oysters were handed to the witness*); this (*holding one up*) is not a marketable oyster. I should not consider it at all fit for the market.

23,608. Do you think it is too small to send to the market?—Yes.

23,609. Here is another, what is the size of that?—That is a very good size.

23,610. Is that an oyster fit for eating?—Yes; that I should say is an oyster of one year's growth.

23,611. Is it fit for laying down?—Yes, I think so.

23,612. Would you interfere with the taking of oysters for laying down?—Yes; but I apprehend they are not kept on the beds to grow for another year if they can sell them at once.

23,613. Do you think they are shipped off and sold?—Most assuredly. There may be a few that are kept, but not many.

23,614. How much would you diminish the size of the gauge?—I would diminish it to two inches. I believe that would be a very good size.

23,615. Is there any other regulation or improvement that you wish to suggest?—I cannot say much about the catching of oysters, but I know that I have found spawn in them very frequently on opening them in the month of April.

23,616. You have found spawn in them in April?—Yes, and also in September, and that I think is a sufficient proof that they were not eatable at that time.

23,617. Have you noticed the appearance of spawn in the oysters that are laid down on the beds?—I mostly get the oysters from the beds.

23,618-9. Do you think that these oysters spawn about the same time as the others?—Yes, I think so. I do not think that they grow as well on the beds or that they propagate as well as in their native element. I think it does an injury to them to a certain extent to remove them from the beds when they are spawning.

23,620. One of the witnesses referred just now to ebbing nets, what are they?—I do not know. I should think that he means ground-seines. They are draw nets. I know that that description of net is very destructive to the small fish. They draw them on the beach.

23,621. That is the ordinary seine?—Yes, it is a ground-seine, and in my opinion the ground-seines destroy great quantities of the spawn of fish. I do not care how large the mesh is, because it draws in the weed and all the accumulated stuff about. It draws all before it.

23,622. Have you ever been concerned in the pilchard-fishing here?—I have not been concerned in the seine pilchard-fishing, but I have in the drift-boat fishing.

23,623. Is there much drift-fishing going on from this port?—I am not aware. As a general rule they do not hail from this port, but they call here and make it their port of call.

23,624. You heard just now that at St. Mawes they propose to keep the drift-men a league and a half off the coast?—Yes.

23,625. Do you think that that is desirable?—Yes, I do.

23,626. Would that not interfere with the interest of the drift-fishermen?—It might interfere with the interest of the drift-fishermen to a certain extent, but I think it would be very greatly beneficial to the country.

23,627. In what way?—I believe that the drift-men break the shoals when they are coming in close along the shore at certain seasons of the year.

23,628. Is there much seining practised here?—Yes, a considerable amount.

23,629. How many seines are there?—I do not know. The St. Mawes men will tell you better than I can. I believe there are six at St. Mawes. There is a great number along this shore up to the Deadman Point.

23,630. Do you think that the seining-men are injured by the drift-men?—Yes, I think so in the seining months.

23,631. And upon that ground you would keep the drift-men off the shore?—I would keep them off at least three miles; I would certainly keep them off a league.

23,632. Would it not be extremely difficult to impose a regulation requiring the drift-men to haul up their nets directly they came within three miles?—There would be very little danger if they shot their nets before they came within three miles.

23,633. Do you think that the tide has nothing to do with it?—No doubt if they shoot off the harbour the tide will bring them in towards the harbour, but a man can tell very well where to go to shoot his nets without being interfered with by the tide.

23,634. Do you think that the injury done to the interests of the seine-fishermen is so great that there should be some restriction placed upon the drift-men?—They affect other fishing as well; for instance, they carry away the crab pots and the lobster pots; they will take them away a mile from the shore.

23,635. The drift-net men do that?—Yes.

23,636. How is it that the drift-men come so near the shore as that?—They come to within a quarter of a mile sometimes.

23,637. But is it not their interest to keep clear of the bottom where it may be rocky?—No doubt it is, but they come in notwithstanding.

23,638. And I apprehend they would not be likely to catch lobster pots if they could help it?—Perhaps not.

23,639. That damages their nets, does it not?—I think they are likely to do much more damage to the crab pots than to their nets.

23,640. Have you ever known crab pots or lobster pots carried away by the drift-nets?—Yes, I have heard complaints made every year; every season it is a matter of great complaint. So far as regards trawling I may say that it was my principal fishing in my early days, and perhaps I may be allowed to state that in my opinion trawling destroys no amount of spawn whatever.

23,641. Have you been a trawler?—Yes, I used to make my own trawl-nets. There are some trawlers I believe in the eastern counties who use a very small mesh.

23,642. What mesh did you use?—It was a mesh from three to four inches from knot to knot, I never used anything less than that in the cod part of the trawl.

23,643. And you say that you never got up spawn in your trawl-net?—Never in my experience. I was 25 years trawling and I never caught a basketfull of spawn.

23,644. (*Mr. Lefevre.*) How long have you been engaged in purchasing oysters?—I have been engaged in it for the last 10 or 12 years.

23,645. Do you agree with Mr. Williamson that a decrease in the quantity has taken place within the

last four years?—Yes, most assuredly; the decrease has been very great indeed.

23,646. During the last four years?—Yes.

23,647–50. Previously to that time had there been no diminution in the oysters?—We never felt it so much, although there was a considerable falling off.

23,651. Are there any oysters sent off from the beds by train?—I believe there are some.

23,652. Where do you sell them mainly?—For the town consumption.

23,653. I think you said that a good many of these small oysters are sent off that are not intended to be laid down?—I was only speaking from my own judgment; I do not know that as a fact. I believe there are a good many of them sold in London. I was there the other day, and I saw a good many Falmouth oysters very like those you have there.

23,654. Oysters no larger than these?—Yes.

23,655. And of the same colour?—Yes.

23,656. Are they sent tinged with green?—Do you mean the shell or the fish?

23,657. The fish.—No; people would not eat it, and it would not be offered for sale if it was tinged with green.

23,658. But is it not commonly the case that that is so?—Not always; there may be some. You may find a few occasionally that are tinged with green.

23,659. Do you think that this oyster (*holding up an oyster*) is fit for eating now?—I cannot tell unless I saw the inside of it.

23,660. But do you think that an oyster of that size is fit for eating?—Yes, if it is a full-fed oyster. That, however, would be no criterion with regard to the size at which they should be caught.

23,661. Do you think that oysters of that size when first dredged up are fit for eating?—No, I do not think they are. They should be laid down again for another season.

23,662. Would such oysters fetch any price in the market?—Yes, for laying down.

23,663. But they would not fetch any price in the market for food?—No, not for present use.

23,664. Then it would not be worth while to give 18*s.* a bushel for oysters of that size for food?—If the merchants think they can get 24*s.* a bushel for them in London they would do so.

23,665. But they only get that after the oysters have been laid down?—They will find parties to buy them at that price.

23,666. But they are only bought for the purpose of being laid down?—As I said before, I saw a tub in London a short time ago of that size.

23,667. Were they all of them of that size?—Perhaps not the whole of them, but some of them certainly were.

The witness withdrew.

William Henry Williamson recalled.

W. H. Williamson.

23,668. (*Professor Huxley.*) You wish to add something to your former evidence?—I only wish to say that 95 bushels out of every 100 sold to the likes of me are sold to lay down on the Kentish coast. We buy them in Falmouth Harbour and take them away to our own beds. Many of those we get here when we come down in the season would not be fit for sale at once. Perhaps 95 out of every 100 bushels are laid down on our beds to supply the London market in the following year.

23,669. (*Mr. Lefevre.*) Then they are not sold for food at once?—No; we lay them down on our private beds.

23,670. Would it pay you to sell them at once for food?—No, we do not buy them for that purpose. There may be a few that we send away in casks. They go to London and then are sold there. We pick out the large ones expressly for London. I should be very happy to show you some that I am going to ship away to-morrow if you will go over to Flushing.

The witness withdrew.

William Collins called and examined.

W. Collins.

23,671. (*Professor Huxley.*) You are a fisherman at St. Mawes, I believe?—Yes.

23,672. Have you been a fisherman there for many years?—Yes, from my youth up to the present time.

23,673. Are you well acquainted with the seine-fishing?—I am.

23,674. How many seines have you at St. Mawes?—There are six there now.

23,675. Have they the ordinary mesh for pilchard-seines?—They are made on the old-established plan.

23,676. How long are they?—Nearly 200 fathoms.

23,677. Nearly 200 fathoms?—Yes, some are about that.

23,678. They are worked in the ordinary fashion, I suppose?—Yes.

23,679. By three boats?—Yes.

23,680. What is your regulation at St. Mawes about working turns?—The law used to be that you should ride your turn for 24 hours, except on Saturdays, and in that case you ride it for 48 hours, so that Sunday should be excluded for rest.

23,681. How many stems are there; you call them stems, I believe?—Yes.

23,682. How many stems are there in your neighbourhood?—There are three at St. Mawes, but there are some in Falmouth Bay also, and likewise up in Gerran's Bay. They used to be marked off.

23,683. Are they used by all the men?—Yes.

23,684. How at the beginning of the season do you arrange your turns?—The first in turn takes the first stem.

23,685. Do you mean the first that can get there?—The first who gets there takes the first stem; the next who rows after stops for 24 hours, and then he comes in for his turn.

23,686. You do not make any arrangement at the beginning of the season who shall take the first turn, and then who shall take the next?—No.

23,687. Have you ever had any difficulty in arranging with regard to turns?—We have had a little difficulty occasionally.

23,688. Are there any owners of small seines there?—Do you mean pilchard-seines?

23,689. Yes, small pilchard-seines.—I am the owner of one myself. I have one smaller than the rest; it is not quite as long, but it is quite as deep as theirs.

23,690. Have you had any difficulty in taking your turn with the rest?—No, I had none last year.

23,691. Did you have any difficulty before last year?—I only had it last year.

23,692. Have you known any other persons who own small seines prevented from taking their turns in their regular order?—There are some small seines I believe at Mevagissey, but I do not know that they have had any difficulty in taking their turns.

23,693. No difficulty of that kind has occurred at St. Mawes?—No.

23,694. Have you had a good yield from your seine-fishing of late years?—Yes.

23,695. Then you have done very well?—Yes.

23,696. Is it as good as it has ever been?—In my father's days there were plenty of fish caught, but of late years they seem to have greatly increased. The fish seem to have passed in a more regular manner.

23,697. Are there any drift-men who go out from St. Mawes?—There are some at Gerran's Bay; they go out from the port at St. Mawes; they are in the same port.

FALMOUTH.

W. Collins.

30 Mar. 1864.

23,698. Where is Gerrans?—It is a little place round the point.

23,699. How many drift-boats are there there?—I believe there are two there.

23,700. Do many drift-boats come off this harbour from Mevagissey and other places?—There are a great number that come off Gerran's Bay from Mevagissey and Porthloe, and elsewhere.

23,701. Do they interfere much with your seining?—Yes, I know we experienced great interference from them last year.

23,702. How do they interfere with you?—They come in right where the seines are. They came inside where the lurchers were last year. When we see the fish we generally call the seine-boat. These drift-men shot their nets from Gerran's up to the other point, so that they did not drift as there was not much tide; their nets were on the bottom of the ground and they remained steady.

23,703. Did they moor their nets?—No they were not moored, but they had no tide to carry them along.

23,704. In that case they would take all the ground from your turn?—Yes, many times we have gone out shooting in the night, and we have had our seines all drawn in and linked together.

23,705. Then the drift-men in that case shot their nets in such a way as to interfere with your using your nets at all?—Yes.

23,706. Did that occasion great loss and damage to you?—Yes, their nets were shot right inside the fish, and they stopped the fish from coming in.

23,707. Did you not try to get rid of them?—We had no wish to injure their nets.

23,708. Of course not, but would they not get out of your way?—No.

23,709. What is your regulation and custom if the drift-men get inside the seines?—They used to be allowed three miles from any headland, but the day when they observed that regulation is long gone by.

23,710. Would you as a seiner wish to see that regulation revived?—Yes, I should.

23,711. Do you think it necessary to keep them three miles off?—Yes.

23,712. Three miles off all along the shore?—No, not everywhere.

23,713. You think that a less distance would do in some places?—I am sure I do not know. I do not think that they reap much benefit to themselves by coming inside.

23,714. Besides which they actually take up your ground?—Yes.

23,715. Do you think that they interfere with you by breaking the shoal?—Yes.

23,716. Have you ever seen a shoal of pilchards broken by the drift-nets?—Yes.

23,717. Have you seen that yourself?—Yes, I have had a lugger and nets driving myself, and I have experienced it.

23,718. When you shot your nets across the shoal did it break?—Yes, we shot right through them as near as possible.

23,719. Did they not come together again on the other side of the nets?—No, we scattered the fish and they went away anywhere. We experienced that this last year. I never saw the fish go so fast. We believed it was all owing to that.

23,720. What do you do with your fish, are they mostly salted?—Yes.

23,721. Is there any market for them among the country people?—Yes, they chiefly depend on what they get from us; they would not get much fish at a low price if it were not for the pilchard-seines.

23,722. Are the salted pilchards largely exported?—Yes, very largely; Mr. Fox who is here will testify to that.

23,723. Do you export most of your fish?—Yes; but I am sorry to say we had not many last year; we sell them to Mr. Fox for exportation.

23,724. What we wish to understand is, whether the pilchards you take with your seines are devoted to the supply of the country people about here, or whether they are exported; are they sold to hawkers or exported in bulk?—When they are here they are sold fresh; when we take them in the seine, we sell a great many to the public here in a fresh state.

23,725. And the bulk goes for exportation?—The bulk is salted.

23,726. How many good hauls do you have with a seine in the course of a season?—I can hardly tell that; the year before last I caught 1,700 hogsheads in one shoot.

23,727. Would you think that you did very well if you had two or three good hauls in a season?—Yes.

23,728. Sometimes you may go for a number of weeks without getting a haul?—Yes, we did that many weeks last year.

23,729. So that the supply of fish is not at all regular?—No, but the people who consume them here generally wait for the seines to catch, because they prefer the seine-fish to those caught in the drift-nets.

23,730. But the drift-fishermen bring in a more regular supply?—Yes, they generally come in every morning, when they have fish, but they do not catch enough to supply the wants of the people. In Cornwall they salt the fish just the same as you would salt a barrel of pork to keep for winter use.

23,731. Do the drift-men not salt their fish?—The people about here do not like the drift-fish as well as they do the seine-caught fish; they do not think that they salt as well.

23,732. Is there anything else that occurs to you about the seining that you desire to mention?—I have nothing more to say about the seining, except with regard to the small ground-seines that have been spoken of. They are hauled ashore from the land; they have a very small mesh, the same mesh as the pilchard-seine.

23,733. Do you think they do harm?—I have no doubt that they destroy a great quantity of small fish.

23,734. Do you know what an ebbing-net is?—Yes.

23,735. What is it?—They shoot them across the channel in the Truro river. They have a sort of bag in them, and very little fish will run into that bag.

23,736. Then I suppose they catch everything in the river?—I have seen hundreds of fish in the market at Truro, ten brace sold at twopence and threepence about the length of my finger.

23,737. What do they consist of?—Plaice, and all kinds of flat-fish.

23,738. Do you think that that is a very destructive and wasteful mode of fishing?—Yes, you must know that as well as I.

23,739. Is that mode of fishing followed now in the Truro river?—I think it must be, but I do not know. I have been at Truro many times, and I have seen these fish on the stalls there by basketsfull. I have seen 20 or 30 sold for threepence.

23,740. And they were principally plaice?—Yes.

23,741. Are these nets only used in the river?—No, only in the river.

23,742. These are not used along shore at all?—No, they could not be used there.

23,743. (*Mr. Lefevre.*) There is a good deal of the coast I believe where you cannot use the seine-nets?—Do you mean the pilchard-seines.

23,744. Yes.—Yes, there is rocky ground, but in some places we can shoot and moor our seines.

23,745. But there is a great deal of the coast on which you cannot use your seines?—Yes.

23,746. Would you prevent the drift-nets from coming within three miles of such places as that?—I would.

23,747. Why?—Because if they go and molest the shoals as they are going along the rocks we cannot afterwards expect them to come in quietly along the sand.

23,748. But will the fish sometimes strike where you cannot use the seines?—They may do so, but I do

not know where it is. There are look-outs on the hills to look out for them. I do not know a bay where we do not look out for them. We are always waiting to catch them, and directly we see them we shoot.

23,749. But if a shoal of fish were to strike on the coast at a place where you could not use a seine-net, would you prevent the drift-boats from going in there and catching the fish?—Yes, because they would prevent the fish from coming round. If they are disturbed when they are coming along the coast, we cannot expect them to come in a shoal into the bay.

23,750. Quite so. That may be so where you can use a seine-net, but what injury would be done if they came in where you could not use a seine-net?—It is just the same as if you put some cows in a field and were then to put a gate across. If that gate is shut it is impossible for anybody to get them outside.

23,751. I understood you to say that you had a good take last year?—No, we had a bad season last year, but the year before I and a many of my neighbours had good catches.

23,752. Taking it altogether was it a good season last year?—Perhaps not in general.

23,753. Not for the seine-nets?—No; with regard to oystering I agree with what has already been said. I should be glad to see the fence months extended for two months longer.

23,754. (*Professor Huxley.*) Is there anything you would like to add to what you have already stated?—I do not know that there is.

The witness withdrew.

ALEXANDER DENNIS called and examined.

A. Dennis.

23,755. (*Mr. Lefevre.*) You are an oyster dredger?—Yes.

23,756. How long have you been engaged in dredging?—It is upwards of 20 years ago since I first went.

23,757. How many men were there dredging then?—I cannot say.

23,758. Has the number much increased since then?—No.

23,759. The oysters have decreased?—There has been a decrease in the oysters.

23,760. But has the number of men decreased?—No, the number of men has increased considerably.

23,761. What has the increase been?—I should think there are four times as many as when I first went off.

23,762. During the last few years has there been a decrease in the quantity of oysters caught?—Yes.

23,763-4. When did you first observe that decrease?—About four years ago.

23,765. Do you agree with Mr. Williamson that that decrease is in part owing to bad spat?—Yes, for a certainty we have had bad spat for several years.

23,766. Do you think it is also due to over-dredging?—It is hardly due to that, because the oysters have been falling off in other parts. That may have induced buyers to come here, and to a certain extent this port may have been over-dredged in order o supply the market. I believe there were oysters here when they were very scarce in other places, and for that reason the oysters may have been dredged here more closely than in other parts.

23,767. Do you recollect the period before the fence time was introduced here?—Yes.

23,768. Did the introduction of the fence months do any good to the fishing?—Perhaps it has done so of late years.

23,769. Do you think it would be beneficial to extend the fence time at all?—No, I do not think so myself.

23,770. You do not think so?—No, and I will give you my reason for it. There are a great number of St. Mawes men who follow other fisheries and get a livelihood in other ways, whereas hundreds of us would be in a state of starvation if the fence months were extended. In April we should not be able to get anything, and what should we do in that case for our wives and families? It is all very well for the St. Mawes men to say extend the fence months, but they would not suffer in the same way.

23,771. Do you think it would be an advantage to the fishing if sailing-dredging were prohibited?—Yes, to a certainty I believe that. While we are oyster-dredging, when we get our dredge full with the row-boat it will stop the boat, which is not the case when dredging is carried on under sail. We then take up the dredge and have an opportunity of throwing out the young oysters which ought not to be taken. A sail dredging-boat will work on until the dredge is hove up, and then they throw the culch out and put down another dredge. They very frequently dredge along on the ground after their dredge is full, and as their dredge is a great weight, by so doing there is no doubt that they kill a great deal of spat.

23,772. Are the small shells broken up?—They are very thin; some of them are only the size of my nail, or of a shilling. I work with a row-boat 14 feet in length.

23,773. Have you observed any increase in the quantity of weed since the fence time was introduced?—Yes; the weeds have increased considerably.

23,774. Does that do good or harm to the oysters?—I should consider myself that the cleaner the dead shells are when the oysters are ready for casting their spat, the more likelihood there would be of the spat adhering when it falls. There would be less chance of its sticking if the shells were covered with slime or weed, and such things naturally accumulate as soon as the dredging is stopped. If the shells are clean when the spat falls, it is more likely to adhere to them.

23,775. Do you think that any regulation for lengthening the fence time would much increase the quantity of weeds?—Yes; when we break into the ground on the 1st of September we are some hours before we can get anything up except weeds. That checks the dredge and the knife passes over it.

23,776. Do you find more weed in deep water or in shallow water?—More in shallow water, I believe.

23,777. Upon what kind of bottom?—Upon a sandy bottom.

23,778. Is there much of it?—There is not a great deal of it, but there is an accumulation both of sand and weed. I have many times struck down an oar in some places and found that it would go down from two to seven inches, while in other places it would not sink at all. In certain places there is very little mud and weed.

23,779. Where there is much mud the oysters are scarce?—Yes.

23,780. Has the increased price of the oysters compensated you for the smaller quantity you have been enabled to catch during the last year or so?—No.

23,781. Then you have not been able to make as much altogether from the oyster-fishing?—No, we have not been able to get as much.

23,782. Do you agree with Mr. Williamson that the price four years ago was 2*s.* a bushel?—Yes, I think it was.

23,783. It was not more than that?—It may have been occasionally, the price varied very often.

23,784. Had that price been the price for some years before that?—I cannot say exactly, because the price has been almost on a sliding scale. It rises and falls; sometimes it is up and sometimes down; it depends altogether on the quantity coming in and the demand for it.

23,785. But in the last four years the price has constantly been going up?—Yes.

The witness withdrew.

FALMOUTH.

W. Lower.

30 Mar. 1864.

WILLIAM LOWER called and examined.

23,786. (*Professor Huxley.*) Where do you live?—I live in Durgan.

23,787. Are you well acquainted with Helford?—Yes.

23,788. Have you been engaged in fishing there?—Yes.

23,789. Have you practised crab and lobster-fishing?—Yes.

23,790. Do you think that the crabs and lobsters are becoming scarce?—Yes, they are becoming scarce. There are not half so many as there used to be.

23,791. Within how many years has that falling off taken place?—Within the last five or six years.

23,792. Were there plenty up to that time?—Yes, they were very plentiful up to that time.

23,793. What is the reason of the falling off?—With regard to crab-fishing I think it has been occasioned by so many nets being shot round and catching the small ones before they come to be large ones.

23,794. What sort of nets do you mean?—Thornback-nets.

23,795. What sort of nets are those?—They are nets made for catching flat-fish and thornbacks.

23,796. What kind of nets are they?—They are commonly called trammel-nets.

23,797. Will you describe one of them?—They are nets with three rows of meshes; they have two outside, one very large mesh, inside a small mesh; the inside one is set slacker than the large one. The fish get in and go through, when they get into a bag and they cannot get out again. These nets destroy a great many small crabs in the course of a season.

23,798. Where are these nets set, are they between tide-marks or where?—No, they are used in the bay on a sandy bottom.

23,799. How deep are they?—Sometimes they are 8 or 9 and from that to 10 and 12 and 14 fathoms.

23,800. How is a net of that kind sunk, with an anchor?—No, by lead.

23,801. Have they a buoy fastened to them?—Yes, at each end.

23,802. How long do they allow them to remain down?—They lay them down one morning and haul them in the next morning.

23,803. Is that in the same part of the sea where the drift-net fishing is going on?—No.

23,804. You think that the use of these nets is a great cause of the falling off of crabs?—Yes, that is my opinion, but they have nothing to do with the lobsters. They do not injure the lobsters at all.

23,805. Can you suggest any remedy?—No.

23,806. Are the crabs caught in that way taken to the market?—No, they cannot get 20 up alive.

23,807. Are they all dead when they come up?—Yes, and are all smashed up together.

23,808. Then nothing short of stopping that mode of fishing altogether would remedy that evil?—No, I would not allow one of those nets to be shot.

23,809. You say that the lobsters have fallen off also?—Yes.

23,810. What is the reason of that?—There are too many small ones taken out, and as they get all the berry fish as well we cannot expect the lobsters to increase.

23,811. Do not the berry fish bring a higher price than the others?—No, they bring just the same price. If they are above 11 inches or below 11 inches they all bring the same price.

23,812. Do you think that they ought to put the berry lobsters back again?—Yes, I think so, if they want to have more lobsters.

23,813. Do they go on taking lobsters all the year round?—No.

23,814. How many months of the year are the lobsters taken here?—I cannot say. Some seasons we begin a little after Christmas and continue until August; in other seasons we do not begin until March, and we go on then until August. It depends on the way in which the weather sets in.

23,815. Do you get them in the harbour here?—No, outside.

23,816. Do you think there has been any falling off in other kinds of fish?—Yes, there has been a falling off in different sorts of fish.

23,817. Has there been a falling off in hooked fish?—I cannot say that there has been much falling off in hooked fish, taking one time of the year with another.

23,818. Is there as much whiting as you used to get?—I cannot say, because the people here do not go after it as much as they did. The weather has not been good enough.

23,819. Do they get as many when the weather is good?—No, I think not.

23,820. Has there been any falling off in hake and haddock?—Yes, there has been a great falling off. We have caught scores of hakes night after night and season after season, and now there are scarcely any to be caught.

23,821. Is that the same with haddocks?—Yes.

23,822. And with mackerel?—Yes; mackerel have been falling off ever since I have been fishing. I used to follow it up in the months of August and April, and now for the last five years I have hardly had any at all. I believe there are rather more caught in the seines which they haul ashore.

23,823. Are you speaking now of catching them with a hook?—No, of catching them in the drift-net.

23,824. And they have fallen off?—Yes.

23,825. Can you give any reason for that?—No.

23,826. Are the ground-seines used here?—Yes.

23,827. You are speaking of Helford?—Yes.

23,828. Do those seines destroy much small fish?—Yes, they are sure and certain to do that. I use them a good deal myself, and therefore I know.

23,829. What would be the best mode of preventing the destruction of small fish?—The only thing I know of would be to have a larger mesh.

23,830. What is the size of the mesh you use now?—We use now 13 and 11.

23,831. You are of opinion that that would make all the difference?—Yes, it would make a great deal of difference.

23,832. Is there much oyster-fishing carried on at Helford?—Yes, a great deal.

23,833. Is there anything you wish to say about it?—No, nothing. I know very little about it myself; it is private property.

23,834–5. Whose property is it?—Mr. Tyack rents it.

23,836. Are there regular oyster beds there?—No, the oysters are all over the harbour.

23,837. Are there any regulations enforced there about the catching of fish?—No.

23,838. The people dredge as they like?—They are employed in dredging at so much a week.

23,839. Is there any limit as to the number of persons who may be employed in dredging?—No; one man rents a place, and he hires people to draw the oysters up for him.

23,840. Is he allowed to have as many to dredge up oysters as he likes?—Yes.

23,841. May he dredge them up of any size?—I never heard anything to the contrary.

23,842. Has there been a falling off in the quantity there?—No, they have rather increased.

23,843. And yet the dredgers do just as they like?—Yes.

23,844. Then according to that it does not seem that it does much harm to take them of any size?—The small ones are not sent away, they are only sent away when ready for the market.

23,845. I presume that for their own interest they keep them until they are of a certain size?—Yes, it is for their own interest to do that; Mr. Tyack did send small ones away years ago, but he found that the oysters were falling off and he put a stop to it.

23,846. Is he obliged to keep the fence months?—Yes.

23,847. Does he lay his oysters down on beds there?—Yes, until he gets enough for a little vessel to carry away to Plymouth.

23,848. And in his hands the supply remains pretty constant?—Yes.

23,849. (*Mr. Lefevre.*) Has there been any falling off during the last four years there?—No, they have increased I have heard.

23 850. What size are they dredged up originally; are they of this size (*holding up an oyster*), or larger?—They are larger than that.

23,851. Larger than this?—Yes.

23,852. How long are they laid down on the beds?—Not more than a week or eight or nine days, some may be there only five or six days. It is according to how quick the vessel can make a passage from Helford to Plymouth and back again.

23,853. Where are they sent to?—Plymouth.

23,854. By boats or by rail?—By boats, but in addition there are some sent into the country.

23,855. Are they bought for the market?—Yes, they are all marketable oysters.

23,856. Who is the owner of the beds of which you speak?—Do you mean the beds in Helford Harbour?

23,857. Yes.—Sir Richard Vivian is the owner of one part, and the Duke of Leeds has also a part.

23,858. Is a great part of the beds bare at low water?—Yes.

23,859. Have they had good spat during the last four years?—Yes.

23,860. There has not been any falling off there?—No.

The witness withdrew.

CHARLES CLIFT called and examined.

23,861. (*Professor Huxley.*) You have heard the evidence which has been given here to-day?—Yes.

23,862. Do you think there is anything that it is desirable to add to what we have already heard?—I cannot say that I am particularly interested in the matter.

23,863. I believe you are clerk to Messrs. Fox of this place?—Yes.

23,864. Are they not largely concerned in the fisheries?—Yes, largely.

23,865. Is there any regulation enforced here which injuriously affects the interests of the merchants?—In respect of what kind of fish?

23,866. Say, for example, seining?—I have heard what has been said about the drift-boats, and the general opinion is that they have done a great deal of mischief by shooting their nets too close.

23,867. Are you aware that there is an old Act of Parliament to keep the drift-boats a certain distance from the shore?—Yes, and an attempt has been made to put it in force by seizing the nets and the boats on some occasions, but still that did not prevent it.

23,868. Within your own recollection have you known that Act put in force?—I have heard of the nets being seized. I have heard of the seiners having gone out and seized the nets after they have been shot.

23,869. Did the magistrates ever convict under the Act?—I cannot say. I do not know that the drift-men have been punished. In some cases I believe there has been a compromise in one way or another.

23,870. We are anxious to know if that Act has ever fairly been brought to a test?—I do not think it has.

23,871. Were there legal difficulties in the way?—I really cannot tell. Where you have seiners and drivers living in the same place they do not like to prosecute each other. There is a kind of diffidence in that respect.

23,872. Then there are no means of knowing, apparently, in this part of the world whether the Act has failed or not, or whether it has been put in operation?—I believe the drift-men generally think the Act is inoperative, and the seine people have not thought it worth their while to put it to a test.

23,873. There have been difficulties about it?—Yes; sometimes they have taken the law into their own hands, and I believe cases have come before the magistrates, but I do not believe that the question has ever been fairly tried or settled.

23,874. We heard at Mevagissey, where Mr. Fox is interested, a strong statement with regard to the interference of the large-seine owners with the owners of small seines, are you aware that that is the case?—I know there are some small seines.

23,875. The small owners complained that they were practically excluded from taking their turns unless they had seines of a certain size?—I do not know that there is any law that affects it but a regulation among themselves.

23,876. It has been a regulation?—Among themselves as seiners.

23,877. Yes, we so understood. Are you able to inform us if the large seines have an interest in excluding small-seine owners?—Yes, they have an interest in doing it, because these small owners cannot catch what the large ones can. If a large shoal of fish comes in the small seines would only be able to take a few of them, whereas the large seines would take them all.

23,878. Will the fact of the small ones being there prevent the others from coming in?—Yes, a large seine cannot shoot in turn while a small seine is there.

23,879. The statement made to us was that the small seine was not as deep as the large seine, and that the large seines can shoot outside the small ones; is it your opinion that that can be done?—In many places the turns are very confined. They are surrounded by rocks, and there is only a small space in which the seines can be worked at all. I do not know whether that is the case at Mevagissey or not, but it is in many places. In some instances I think they might shoot outside where a small seine would not touch the ground, but it would lead to confusion and to disputes, and even battles. In point of fact they would prevent each other from shooting. If a small seine had possession of a turn, and a large seine tried to shoot outside her, they would run their boat into the small net, and both would be prevented from shooting at all. I believe that that was done to some extent at St. Mawes last year, but I do not know whether it was done between the small and the large seines, or whether it did not occur when two large seines came in collision, and there happened to be a dispute as to whose turn it was. I know the result was that they allowed a large shoal of fish to escape while they were disputing whose turn it was.

23,880. If the small seines were allowed to compete with the large ones would they do the large ones more damage than they would do themselves good?—I think a large shoal would frequently be allowed to escape if there was only a small seine there.

23,881. You think that a large proportion of the fish might escape?—Yes.

23,882–3. But still the small seine would take a sufficient quantity to pay them handsomely?—But if they allowed a large proportion of the fish to go it would be disadvantageous to the general yield.

23,884. Do you think that that is the ground on which the large-seine owners for the most part oppose the competition of the smaller seines?—It is only of late years that there have been any small seines, and they have principally been made from mackerel-seines into pilchard-seines by adding Dungarvan net to them. I believe they put Dungarvan net in the centre and mackerel net at the ends.

FALMOUTH.

C. Clift.

30 Mar. 1864.

23,885. Have the large-seine owners made regulations among themselves, or have they legislative sanction of any sort for what they do?—I think it is a matter of mutual arrangement. There is one place in the county where they are governed by Act of Parliament.

23,886. Where is that?—St. Ives.

23,887. That is by local Act?—Yes.

23,888. There are no local Acts here?—No.

23,889. And the duchy cannot interfere?—No, it has no right, because they are in deep water. The duchy makes a claim to the foreshores.

23,890. Has the duchy the foreshores?—It claims them.

23,891. That is a question which is not settled yet?—I believe there is a dispute between the duchy and the Ecclesiastical Commissioners and Lord Wodehouse.

23,892. (*Mr. Lefevre.*) Possession of the foreshores would not give the duchy any right over the fisheries?—Not over the pilchard fisheries.

23,893. It would then give no right such as would enable them to make a charge for dragging a net between high and low water-mark?—No; I believe the Ecclesiastical Commissioners claim the bottom of the harbour here.

23,894. The ground of the harbour?—Yes.

23,895. Do you know anything about the private beds which exist here?—Yes, I know them.

23,896. Is there any title to them; has anybody the power of granting those beds?—There was a dispute between the Ecclesiastical Commissioners and the duchy; the duchy laid claim to them and the Ecclesiastical Commissioners also.

23,897. No rent is charged in respect of them?—No, none at all, except in some cases where parties own the land adjoining, they claim or pretend to claim down to low-water mark, and in some instances an acknowledgment of 5*s*. or 10*s*. a year has been paid for the use of the beach. It is said, however, that they have no right to make such a charge.

23,898. Do you know persons who have got beds of that nature?—There is a number of merchants here who buy oysters and who have those beds. There are also fishermen who lay down oysters in certain parts of the harbour for themselves and sell them to the merchants in the season. There may be, I should think, 150 different persons who are interested in that way.

23,899. Are the beds all staked out?—They stake them out among themselves by stones and sticks and in different ways.

23,900. Do you think the regulations respecting the stems with regard to seine-fishing might be altered so as to admit of small seines?—I really do not know in what respect you can alter them. One regulation affects the whole, and as far as I can see I do not see how you can make a different regulation from that which now exists. It is only as to the stems that these regulations are made.

23,901. But those regulations were made at a time when the nets used were all of one size?—No doubt.

23,902. Is it necessary that the regulations should require the nets to be of one size?—I believe it would be for the general advantage if it were so.

23,903. You do not know enough about the regulations to give us any information in regard to them?—The regulations vary at different places; there are scarcely any two places on this coast where the regulations as to stems are the same. It all depends on the fishermen themselves. They come to an agreement among themselves.

23,904. (*Professor Huxley.*) Have you reason to think that there has been any falling off, taking one year with another, in the seine pilchard-fishing?—Seining is a very precarious fishery. For a series of years you may probably scarcely get a fish, while at other times you will get large catches.

23,905. During a range of 10 years, for example, do you think the average has much altered?—It differs very much. I have known 50,000 hogsheads taken in a season, and in other seasons there have perhaps been not more than four or five.

23,906. During the last 10 years has there been more fish caught in that period than during the preceding 10 years?—No, not on this coast.

23,907. You think that less fish has been caught?—Yes, on this coast. The fact is, we sometimes see a very large quantity of fish off the shore; sometimes they come on the shore and yet they are not caught. There has not been any falling off in the quantity of fish which visit the shores, but sometimes there has been no opportunity of catching them. At times they have not come into the stems, and at other times, in consequence of bad weather, they have kept out for some distance, so that we could not catch them. I do not think there has been any falling off in the quantity of fish itself.

23,908. Do you think that a vast quantity of the fish caught by the drift-net fishermen could not be caught by seining?—I have no doubt of it.

23,909. Then it is for the benefit of the community to have drift-net fishing as well as seining?—I think so.

23,910. Do you wish that there should be some regulation to prevent the drift-net men from interfering with the seiners?—I think they should not be allowed to come so near the coast as to interfere with the seining.

23,911. Do you think that the old regulation of a league or a league and a half should be enforced?—I think they should be confined to that.

23,912. Have you yourself any acquaintance with the drift-fishing?—Only from seeing it carried on.

23,913. Do you think, from what you have heard the fishermen say, that any regulation of that kind would interfere with their interests?—I think it would, because when the fish are close in-shore they go just outside the harbour and shoot their nets and get their boats full, whereas if they went outside they would get no fish at all, if the fish were in-shore. It is, however, when the fish are in-shore that the seiners are looking out for them, and that is their harvest. The fish may be out for weeks and months sometimes, and yet the seiners will get no fish at all. Of late years they seem to have struck upon the coast almost at the same period of time within a few days.

23,914. The pilchard is an important article of food to the people of Cornwall?—Very important indeed.

23,915. Are the people supplied more particularly by the seine or by the drift-boats?—I think the fish supplied for immediate consumption are supplied by the drift-boats, but the people generally prefer the fish caught in the seine for salting for winter consumption. The seine fish are not bruised, whereas the drift fish are bruised, and sometimes their heads are torn in taking them out of the meshes.

23,916. Then they pay a higher price for fish caught in the seines?—No, they get them cheaper because they are caught in larger quantities.

23,917. Do you export large quantities of seine-caught fish?—Yes.

23,918. Can you give us a rough estimate of the quantity exported, and the quantity sold for home consumption about the country?—It varies in different places. There are some places where larger quantities are sold for home consumption than others. It is according to the population, and the means they have of taking them into the country.

23,919. Taking one place with another can you give us any comparison?—I should think that seven-eighths of the seine fish are exported, but that is merely a rough estimate given at a guess.

23,920. They go to the Mediterranean, I believe?—Yes, the whole of them are exported.

23,921. They are very largely consumed in the Roman states, are they not?—Yes, and in all the Italian ports, not in the Roman states alone, but at Genoa, Leghorn, Ancona, Naples, and Venice; they are taken into the interior of Italy from those places.

23,922. Do the seine men think it would be a benefit to the fishery to keep the drift-boats within a reasonable distance?—I think that is essential.

FALMOUTH.

C. Clift.

30 Mar. 1864.

23,923. Is there anything else that is of importance as bearing on the interests of the seine-fishing?—I am not aware of anything else. I do not know of any regulation that ought to be made in respect of turns at different places. I can hardly say whether it would be well to have regulation on the subject, or to leave it to be arranged among the seiners themselves. I think that any general legislation would not do with regard to seine-fishing.

23,924. (*Mr. Lefevre.*) Is there any quantity of pilchards sent to London?—There may be a few sent, but there is no demand for them there. There are scarcely any sent beyond Devonshire.

23,925. Is it the fact that the fish often strike the coast at points where they could not use the seine?—Yes; that occurs very often.

23,926. And they go off again without the seinemen being able to catch them?—Yes; they are frequently off the shore when the seiners are waiting for them in places where they can shoot their nets. They see them at a great distance coming into the shore.

23,927. Are they in the habit of coming regularly in-shore, or do they strike the coast and go off again? They generally strike the coast and run along the shore. Sometimes they go from headland to headland.

23,928. Without coming into the bays?—Yes, sometimes, but frequently when they come along the shore they go into the bays and all round the coast.

23,929. (*Professor Huxley.*) Might there not be some practical difficulty as a matter of police in working any regulation for keeping the drift-net men a certain distance from the shore; for instance, if you wished to enforce the regulation of a league or a league and a half, how would you carry it out in practice?—I think there should be some penalty attached to an infringement of the regulation.

23,930. But who is to keep watch and ward?—The seiners themselves would do that when they are out in their turns. If the drift-men came in to interfere with them they would see who they were.

23,931. You mean if they came fairly within reach of the seiners?—Yes; they do that often.

23,932. But suppose they are a mile off they can make nothing of them then, they cannot make out their number?—No.

23,933. Then in that case how would it be possible to carry out the regulation?—We have a Coastguard cruising about. If they saw the drift-men with their nets overboard within the restricted distance they could board them.

23,934. There is no Coastguard boat regularly rowed along the coast; the Coastguard men are mostly on the shore, are they not?—They are on the shore, but they keep long-boats at different places and crews of men. They have also a sailing vessel here which I think they could send out.

23,935. A cruising boat?—Yes, and you must remember that it is rather a difficult thing for a drift-man to get up his nets and be off at a short notice.

23,936. That operation would take up some little time?—Yes.

23,937. (*Mr. Lefevre.*) At night would it not be a difficult question to decide whether the drift-men were within a league from the shore?—Yes.

23,938. (*Professor Huxley.*) Do you think that regulation would have the effect generally of keeping them out?—Yes.

The witness withdrew.

W. H. Williamson.

William Henry Williamson recalled and examined.

23,939. (*Mr. Lefevre.*) Are there any means of ascertaining the quantity of oysters taken from Falmouth Harbour?—Not correctly; I have shipped away myself in the course of a year 18,000 bushels.

23,940. Can you give us statistics of the number sent off by yourself?—I should think during the last six years I have sent away from this port 80,000 bushels.

23,941. By referring to your books could you give us an accurate account?—I could do so in London.

23,942. Will you send a statement to the secretary?—Yes.

23,943. And also the price you have got?—Yes. I do not know that I can give you the average price we have got for them, but I can give you the average price they have cost.

23,944. That is what I want.—I shall be glad to send you a return.

23,945. Do you buy from any other place besides Falmouth Harbour?—Yes, I buy all over England, Ireland, and Scotland.

23,946. On this coast I mean?—I bought some at Saltash a few years back, and I have bought a few of Mr. Tyack of Helford, but that is some years gone by. You will not find any oysters after leaving this until you get round to Milford where I have an agent buying for me.

23,947. Is there a larger quantity exported direct or laid down in beds?—Not one bushel in a thousand is sold for London compared with what we send to our beds to be laid down.

23,948. Then the main supply from Falmouth Harbour is sent away for laying down in other places?—Yes, they are sent to the Kentish coast for market elsewhere.

23,949. Is the quantity laid down on the beds here large?—The middle man buys of the dredgers and he lays down a good many, and then when merchants like me come down we buy again of them. Perhaps some send a few by casks to London, but the greater part of them are laid down.

The witness withdrew.

W. Collins.

William Collins recalled and examined.

23,950. (*Professor Huxley.*) You wish to add something to your former evidence?—Yes, I have a little seine of my own. It is as deep as the others but not as long; but I have been thinking within myself why should I be restricted from using it. There are some persons who like to have schooners, and there are others who like to have ships. There is no objection to that, and why should I as a fisherman, if I have a seine and want to use it, be prevented from taking my turn as well as the other seiners.

23,951. In fact you are for free trade in turns?—Yes, to take the regular turn of 24 hours the same as the others. They made no objection to it last year, and I think it nothing but right that I should be allowed to fish. I am not one of a company; there are some ten in a company who have a seine here but I have thought it best for myself, even if I have only a shrimp net, to have it all to myself. There is strong opposition in companies sometimes, whereas I have no one to fall out with except myself.

23,952. Do you think that you ought to have a turn irrespective of the size of your net?—Yes; my seine has caught a large quantity of fish. In one instance a large seine caught 1,700 hogsheads. I never did that, but if I catch three or four or five it is enough for me.

23,953. Suppose some of your neighbours set up seines one third the size of yours, would you like them to compete with you?—Yes, if their mesh was of the right size.

23,954. But suppose a man with a net one third of the length of yours occupied your turn, what would you say then?—He must take his turn as well as myself.

23,955. You think that is all fair and right?—Yes, we must give in to that.

FALMOUTH.

W. Collins.

30 Mar. 1864.

23,956. You are prepared to stand by that ?—Yes.

23,957. (*Mr. Lefevre.*) What is the depth of your seine ?—12½ fathoms.

23,958. Is that the same depth as the larger seines? —I believe it is, but I do not know exactly, I believe there is a regular scale for the meshes of a seine, and they must all be of that size.

23,959. (*Professor Huxley.*) Is there anything else you wish to add?—There may be one seine 160 fathoms long and another 180, that however would be a large seine. Mine is 140 fathoms long and that is a small seine. I may be about 10 or 20 fathoms short of most of them, but yet I can shoot to the same depth of water.

23,960. You do not object to the chance of being shut out by a man with a smaller seine ?—No, provided that his seine is of the same mesh.

The witness withdrew, and the inquiry was adjourned until March 31st, at Penzance.

Penzance, Cornwall, Thursday, 31st March 1864.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

J. Kelynack.

31 Mar. 1864.

JOHN KELYNACK called and examined.

23,961. (*Professor Huxley.*) Are you a fisherman here ?—I am a fisherman at Newlyn.

23,962. How many years have you been a fisherman there ?—All my lifetime.

23,963. How many years back can you recollect the condition of the fishing ?—I daresay for 60 years back. My grandfather was a fisherman, and I have been a fisherman all my life.

23,964. Do you know how many people are engaged in fishing at Newlyn ?—I cannot say exactly, but I was calculating it up last night, and I think there will be, taking fishing-boats and fishing-craft, and all the materials together, about 200,000*l.* afloat in Newlyn now.

23,965. You mean that there is a capital of 200,000*l.* at Newlyn invested in the fisheries ?—Yes, in drift-boats, pilchard, herring, and mackerel-boats. I should think it would take quite 200,000*l.* to put them afloat.

23,966. How many fishing boats, at a rough guess, are there at Newlyn and Mousehole ?—There are 15 at Mousehole, and 17 mackerel-boats at Newlyn.

23,967. Are they mackerel-boats alone ?—Yes.

23,968. Are the same boats that you use for mackerel-fishing used in the drift pilchard-fishing ?—Not always; we have another class of boats for that.

23,969. How many of these drift pilchard-boats are there at Newlyn ?—About 50.

23,970. How many are there at Mousehole ?—Twenty. They are not particularly drift-boats. Some of them are used in drifting for fish, and some are used as line-boats.

23,971. Are the mackerel-boats used for hooking in the same way as the drift pilchard-boats ?—Occasionally.

23,972. Have you separate boats for hooking ?—Sometimes, when the drift-fishing is poor, and we are unable to catch fish by the drift-boats, we use them for hooking.

23,973. Have you no separate herring-boats ?—Not now; we used to have them at one time, but not now.

23,974. Are there any trawlers ?—There are a few —about four or five—in the bay.

23,975. Do they belong to Mousehole ? — To Mousehole and Newlyn.

23,976. How large are the trawlers ?—They are little handy boats, from 24 feet to 30 feet keel.

23,977. Are they decked boats ?—No.

23,978. They are not decked boats ?—No, they are boats of about 10 tons.

23,979. Do you trawl in open boats here ?—Yes.

23,980. And you have about four or five of these boats ?—Yes, but the trawling here is a mere nothing. There is just a time or two when a poor man will get out in the winter months, and take a few soles for the gentry here at Penzance.

23,981. Is it not a good trawling-ground ?—It is no great things.

23,982. Have you mostly a rocky bottom ?—A great part of it is rocky, but there is a little narrow strip of sand.

23,983. Do the Brixham trawlers come off this bay? —Yes, a great deal.

23,984. But they keep outside ?—They fish about four or five leagues off.

23,985. Is there any oyster-fishing here ?—There are no oyster beds here, but I believe that from 300 to 500 men might be employed in oyster-dredging, if they were introduced here, and a nursery made.

23,986. Is there a large supply of oysters in the bay ?—We expect there is. I have understood at Newlyn that some of the fishermen there have hauled up oyster-shells in the crab-pots.

23,987. Have you any reason for thinking that oysters are spread generally over the bay ?—I daresay there are oyster banks in the bay.

23,988. Are there no regular oyster dredging-boats here ?—Not one.

23,989. Is there much crab and lobster fishing ?—There is very little now, but there used to be a great deal.

23,990. It has fallen off ?—Yes, very considerably. In my boyhood the old men used to bring in an abundance of crawfish.

23,991. Is there no crab and lobster-fishing now ? —There is very little of it.

23,992. It is not much practised at Newlyn and Mousehole ?—Not at all now ; there is very little of it.

23,993. Have you any seining ?—Yes.

23,994. How many seines are there ?—I should think there are about half-a-dozen pilchard-seines at Newlyn.

23,995. Are they the large pilchard-seines ?—Yes.

23,996. How many fathoms long are they ?—From 250 to 300 fathoms.

23,997–8. Are there many in Mousehole ?—No, not one.

23,999. How has the fishing been of late years, has it been better or worse than when you first knew it ? —It has been a great deal worse.

24,000. Have all sorts of fishing been worse ?—Yes.

24,001. Mackerel-fishing ?—Yes.

24,002. Drift-fishing? — Yes, drift-fishing of all sorts.

24,003. And the drift pilchard-fishing as well as the seining ?—Yes, but at some particular times they bring in large quantities ; but taking it generally the pilchard-fishing has gone out a great deal in our bay. When I was a young man, 27 or 28 years of age, about the year 1810, a great deal of small pilchards came here, and they thought it not worth while to take them, even for manure. We had poor markets, and did not sell them. In 1811 those little visitors came again ; there was a wonderful lot of them. We caught about 1,000 hogsheads that year, and we could have caught 3,000 if we had markets to take them to the same as we have now.

24,004. Has the number of fishermen remained the same ever since you knew Newlyn ?—The number of fishermen has generally fluctuated.

24,005. Has the number of boats remained the same ?—There was a time when there were as many mackerel boats as there are now.

24,006. Has there been any increase in the number of boats ?—They have more mackerel-nets on board, and they are larger boats than they used to be. They also go further from the land. They go up to Plymouth and to Ireland to catch fish now, such as herrings and so on.

24,007. Is there any regular herring-fishing at Newlyn ?—No, there is very little there ; we never persevere with it. There might be some taken in the season if the fishermen would try for them.

24,008. Is there any in Mousehole ?—No.

24,009. Your people go to Ireland to fish for herrings ?—Yes.

24,010. When do they go ?—They go about a fortnight before Midsummer.

24,011. Do they go in the undecked boats you have referred to?—They are hatched boats, as we call them; some of them are decked boats.

24,012. (*Mr. Lefevre.*) How many of these hatched boats are there ?—About 30.

24,013. (*Professor Huxley.*) Are they in addition to the boats you have already spoken of ?—No, they are just the same boats, some of them are from 30 to 42 feet keel.

24,014. And some of them are half-decked ?—Yes.

24,015. Do they go to Ireland ?—Most of the boats from 30 to 42 feet keel go to Ireland. There are only a few pilchard boats that remain at home during the midsummer.

24,016. When you first began fishing did you have half-decked boats ?—They had just a little deck to them in which we could put a little gear.

24,017. Were other boats smaller than that ?—A boat of 28 feet keel was a large boat in my boyhood.

24,018. What is the average cost of your boats now, with all their fittings ?—If a boat is properly fitted out for the mackerel-fishing, and if it is a new boat with all the requisites for mackerel, herring, and pilchard-fishing it will cost about 700*l.*

24,019. What would it cost when you first began fishing ?—Not so much, they were not so expensive then.

24,020. But what would a boat cost when you first began ?—A boat would cost 100*l.*, and the nets would not cost much ; nor had we many herring-nets to go to Ireland with in my boyhood.

24,021. Then the capital invested in the fishing has increased much of late years ?—A great deal.

24,022. Has it increased double since you began fishing ?—I expect that it has.

24,023. Then do I understand you to say that the supply of fish has been constantly falling off since you began fishing ?—Yes, I believe that it has. I have put down a few remarks here which I will read if you have no objection.

24,024. Is it your own evidence ?—Yes.

24,025-6. Then you may read it.—"Being requested by Mr. Bolitho to give information on the Mount's Bay fisheries, I shall endeavour to do so to the best of my ability. I have been in connexion with the fisheries above 60 years, and I find that the different orders of fishes are not so numerous now as I once knew them to be. First—the stationary fishes, the crab and its kind. I well recollect the time when they could be taken at all seasons of the year, and by simple means, but owing to their having been taken out of their season their number is considerably diminished. Secondly—the flat-fish, such as the turbot, sole, plaice, and various others that our bay used to abound with. They are destroyed in like manner by being caught out of their season by ground-nets in the offing and along the shore. Before the trawl was introduced into our bay it abounded in line-fish, especially the ling. They could be taken at from four to five leagues from the shore in large numbers. Thirdly—the mackerel. Our coast would abound with them, if they were not interfered with during the spawning season. Fishermen should cease to take mackerel about midsummer, and not recommence fishing for them till the latter part of August, for from that time they begin to improve. Fourthly—the pilchards. Their spawning season ought to be observed. They ought not to be fished for before midsummer nor after Christmas. I perfectly agree with the proposed plan of nursing fishes, for I believe that they can be greatly assisted to increase, especially here in Mount's Bay, where the water is so pure that a good nursery could be secured for all kinds of fishes."

24,027. What do you mean by the nursing of fishes ?—I think that the spawn should be kept up. I think that there should be some nurseries made in Mount's Bay, that would have a tendency to protect the fish.

24,028. What you propose is to multiply the pilchards artificially ?—I am not speaking of pilchards, because they are not in the bay all the year round. I am rather speaking of such kind of fish as crab-fish.

24,029. You would have nurseries for the crabs ?—Yes.

24,030. How would you propose to carry out that plan with regard to the crabs ?—I would have it made like a large pond, where I would put the crabs and allow them to spawn. I think we should get a large supply from them in that case.

24,031. Would you make a sort of preserve ?—Yes. They take very small crabs now. I saw a small crab the other day only a few inches long ; it was what we call a red crab or galor crab.

24,032. When you speak of flat-fish being destroyed by the ground-nets, what kind of ground-nets do you mean ; do you mean ground-seines ?—I mean herring seines. Foot-seines we call them ; they are hauled along the shore. I have seen small turbots caught in these nets and brought to the land not bigger than the top of my nail.

24,033. How many ground-seines are there used in this bay ?—Not more than three or four, there used to be more.

24,034. Where do they use them now ?—Out about the rocks about Newlyn and Mousehole there are a few used. There are not more than three or four now. At Logan rock there are many more used.

24,035. I suppose they require a sandy shore ?—Yes, they cannot haul them in unless they have a sandy shore.

24,036. Do you think they destroy great quantities of young fish ?—There is no thinking about it, because I am certain they do.

24,037. How many years have they been used here ?—They have been used here beyond my remembrance.

24,038. Were there as many in your early days as there are now ?—No, not so many.

24,038*a*. Do you ascribe the falling off of the fish to the use of these nets ?—I think the fish have been diminished by that means. Of course if you take away the small fish you must decrease the number of large ones. In warm weather in the summer time these small fish will come in our bay in very large numbers not bigger than the top of my nail. I have seen Mr. Cornish here catch a small turbot the size of his hand, and haul it over again in order that it might get bigger ; but I do not think he will ever get that fish again, the Brixham trawlers would get it.

24,039. Has the number of fish caught by the hook and line fallen off ?—Yes, a great deal.

24,040. How is it with regard to the whiting ?—They have fallen off a great deal to what they used to be.

24,041. Were there plenty of whiting here formerly ?—There were plenty in Mounts Bay, a mile and a half or two miles from Penzance, and within that to half a mile.

24,042. Is there much lobster-fishing about here ?—There are some splendid lobsters here.

24,043. Has the lobster-fishing fallen off ?—Not so much. There are a great number of lobsters caught here now, and 30 years ago they used to catch a large number, and also large crawfish ; they used to fill their pots, empty them into the boats, and put them out again, and they would catch probably about half-

PENZANCE.
J. Kelynack.
31 Mar. 1864.

a-dozen at the next haul; but now they have to fight hard to make anything of a season.

24,044. If the fishing has fallen off for all these years, how is it that you have contrived to double the capital invested?—Our principal fishing here is the drift-fishing. The fish we catch in the drift-nets are not the stationary fish; our capital is invested in that.

24,045. Has not the drift-fishing fallen off?—Very little, because we have extended our drift-fishing to the North Sea and Ireland, that has kept up our fishing.

24,046. Then you have not made your money by the local fishing here but further out at sea?—Not altogether: we should not have got boats to go mackerel-catching if it were not for the North Sea and Irish fishing.

24,047. Does any large part of your population go to the North Sea every year?—Many of our men go to the North Sea; 20 or 30 or perhaps 40 of our boats go there.

24,048. Are they the half-decked boats you speak of?—Yes, they are hatched boats, some of them.

24,049. And do you think that the money you have made in the North Sea and Irish Channel has made up for the falling off here?—Yes, that has tended to increase the capital here.

24,050. (*Mr. Lefevre.*) What number of men are there in the boats?—They are as good seamen as any in the world. They are not all fishermen that are called fishermen.

24,051. But what number of men are there at Newlyn and Mousehole that you call fishermen?—About 700 or 800.

24,052. In the two places?—There are more than that in the two places.

24,053. Are there more than 800 in both places?—You may safely put them down at 1,000. I believe there are 1,057 now employed in the mackerel-fishing.

24,054. Has the number increased very much of late years?—It has increased a little.

24,055. A little, but not much?—Yes.

24,056-7. Are the fishermen employed in seining?—Yes, particular fishermen are employed in seining.

24,058. Do they also employ a certain number of landsmen?—Yes, most of them are landsmen in the bay about here. At Mullion we generally get fishermen. In our bay we generally employ landsmen, except a few of the best men.

24,059. Has the number of seine nets increased in the bay?—Not in this bay, but the seine nets have increased at St. Ives.

24,060. But not in the bay here?—No.

24,061. Has the number of drift-boats increased here of late years?—The drift-boats have increased by reason of the North Sea and Irish fishing, and some of our pilchard-boats have increased owing to that. They make a little bit of money from these fisheries, and they employ it in the summer season in catching pilchards.

24,062. Do more boats go out now after pilchards than formerly?—Yes, a great many more. There are not as many men employed at Newlyn in the seine-fishing as there used to be, by a great many.

24,063. When did you first go off to Ireland to fish?—We go away about a fortnight before midsummer.

24,064. But how many years is it since you first began?—Between 30 and 40 years. There were very few at that time, I cannot say how many.

24,065. Are your boats registered at Penzance or St. Ives?—Penzance is our port. They are not registered now, they are numbered.

24,066. How long is it since the trawlers first began to trawl off this part?—The Brixham trawlers have been coming here for close on to 60 years. I know there were Brixham trawlers coming here when I was a little boy.

24,067. Has the number increased of late years?—I should think it has increased. There are now three times as many visiting our coast as there used to be.

24,068-9. Do they bring in their fish here?—Sometimes the Plymouth people carry them home.

24,070. Do they come here all the year round?—No, they will trawl all the fish upon the ground, and by the latter part of April they will scarcely be able to catch a ray.

24,071. Are they off here now?—Yes, a great number of them.

24,072. Are they bringing in their fish here?—Some of them do.

24,073. Do you attribute the falling off in the quantity of fish here to the trawlers?—I should think that the ling fishery here has been almost annihilated by the trawlers; in my day we used to catch from 100 to 200 ling in the course of the day, but there was no trawling ground here then.

24,074. What distance did you go to for ling?—About four leagues off.

24,075. Is that ground that is trawled over by the Brixham trawlers?—Yes.

24,076. Do you find that ling has fallen off much of late years?—Yes; since my boyhood it has fallen off very much, we can hardly catch a ling now.

24,077. Do you think the trawlers catch the fish you used to catch?—They do not catch the fish we used to catch.

24,078. Do you think they catch a great many ling now?—They catch a few, and also conger and skate.

24,079. What are the principal fish they catch?—Turbot, sole, and brill.

24,080. They do not catch a great number of ling in proportion?—Not so many ling, because they do not trawl for ling. Ling is found at a little distance from the ground in a general way, and the trawl itself goes over the ground. Turbot and sole being on the ground they are caught. They catch more turbot by day than by night, because they are off the ground at night.

24,081. Do they bring in many hake?—Not so many as the Plymouth men, and not as many as at Plymouth, but they do not trawl here for hake in general.

24,082. How long are your boats away when they go to the north coast?—Some are away for 12 or 13 weeks.

24,083. Do they come back in time for the pilchard season?—They come back for the mackerel in November.

24,084. Does your mackerel season begin in November?—Yes.

24,085. How long does the mackerel season last?—It sometimes lasts from six to eight weeks.

24,086. Does the pilchard season then begin?—It begins at midsummer.

24,087. Do the boats come back in time for the pilchard season?—Some come back in the latter part of August. Those in the north seas generally try to go home if there are any mackerel about, but in some seasons we do not catch any mackerel.

24,088. Do you go off every year to the North Sea?—No, I never went to the North Sea, but I have been to Ireland, and I have been mackerel-catching for 14 or 15 years; I have also been at pilchard-catching.

24,089. Do you own the boat yourself?—Yes.

24,090-1. What is it?—It is one of the mackerel boats.

24,092. (*Professor Huxley.*) Have you ever been interfered with by the trawlers when drift-fishing?—Yes, when I have been mackerel-catching sometimes at Plymouth.

24,093. In what way?—They trawl in the night when we are drifting.

24,094. Do they trawl over your nets?—Yes.

24,095. What sort of lights do you carry?—We have one light up then.

24,096. Only one light?—Yes, only one.

24,097. Did you yourself ever drift for herrings?—Yes.

24,098. What lights do you carry then?—Only one light, but it is a great many years since I went to Ireland.

24,099. Do your people in general carry only one light?—Yes, generally.

24,100. Did you ever hear of any regulation about that?—I have heard something about it of late years, but our men never go out with one light alone. They carry in the vessel a flambeau, and if anything comes nigh hand to them they show that light.

24,101. They show it when they see a vessel?—Yes.

24,102. What sized meshes do you use in the herring-nets?—Generally from 10 rows to the foot up to 10½.

24,103. How many to the yard?—33 to the yard.

24,104. That is before the net is wet?—Yes.

24,105. Do you know of any regulation about that?—It used to be said in Ireland that no nets were allowed to be shot overboard that were more than 12 rows to the foot.

24,106. Is there any regulation of that kind put in force here?—None at all; a fisherman fishes as he likes here; there are no regulations or anything of that sort to affect him here. If he wants to go out trawling, seining, or shooting drift-nets he may go when he likes.

24,107. Nobody's nets are ever interfered with?—Sometimes the fishermen come in contact with each other.

24,108. But there is no inspector, no Government officer to interfere with them?—No.

24,109. Is there any regulation here about the distance the drift-men must keep off the shore?—No, I have never been annoyed with any regulations of that kind. The drift-men have never been told to keep at any distance. When I was a huer of a seine I was never interfered with by the drift-boats. I kept that position for about 30 seasons. I know the pilchards well; I was reared in the fisheries, and nobody can tell better about pilchards than I can.

24,110. Did you ever find it necessary while you were a huer of a seine to interfere with the drift-men for working over your ground?—No; I think if we seined properly, and the drift-men used their nets properly, we should never do each other much harm. If we found one coming too near the other we could always keep ourselves within bounds. Of course if I have my seine in and see the drift-men coming down upon it I should not like to have it interfered with. If I were to explain all I know about the business I think I should hurt both one and the other too.

24,111. It is our business to learn all we can with regard to your mode of fishing. You have stems here, I suppose?—Yes.

24,112. How many stems are there in that district?—There are three stems to the westward of Newlyn. There used to be five boats, two of them are not used now. I have caught pilchards in what we call the K. H. stem; five years back in the month of April I took 300 hogsheads.

24,113. Who settles the stems?—They are settled by a law among the fishermen themselves.

24,114. They arrange it among themselves?—Yes.

24,115. How do you arrange your turns?—We generally have 24-hour turns, or we keep it till we shoot it away.

24,116. What is the general custom here?—It is generally 24 hours. In my boyhood we used to keep it till we shot it away.

24,117. How do you arrange who is to have the first turn?—We all know that very well. If I get the first stem to-day another will get first stem to-morrow, if I do not shoot the stem away; that is the way in which we generally arrange it.

24,118. Is there any regulation about the size of the seine? Can a small seine come in and take a turn along with a large one?—Not a proper pilchard-seine. No seine would be allowed to lay in the way of another seine.

24,119. But suppose a man had a pilchard-seine 150 fathoms long, would he take his turn along with the rest?—Everyone has a great interest at stake, and he would not be willing that a small seine should come in and take the turn along with a big one.

24,120. Have the small-seine owners tried to take in their seines as well as the big ones?—Yes, they have.

24,121. And they have been kept out of it?—Yes; I know of one at Newlyn who had a pilchard-net put in the middle of a mackerel-seine and he was kept out of it.

24,122. By what authority was he kept out of it?—I do not know by what authority, but he was kept out.

24,123. There was no law on the subject?—No.

24,124. It was a mere matter of physical force?—Yes, and that is generally so with regard to the fishing here.

24,125. Why is it that the large-seine owners have such an objection to the small-seine owners working with them?—I cannot tell.

24,126. If you were a large-seine owner what would you do?—I should like to keep my stem good, and should not like a small-seine owner to come up and interfere with my fishing.

24,127. Is that because you think he could not catch the same number of fish, and that he would spoil your turn?—He would not catch so many fish. Sometimes the shoal of fish is very small, and then a small seine would be able to enclose it; but if it was a large shoal then it would require a large seine to enclose it.

24,128. Are the small seines of the same depth as the large ones?—Not at all.

24,129. Could they not lie inside of the others?—They would not like to have any other seines interlining them or rowing in the stem; they would keep other people out.

24,130. You think it would not answer to have nets of different depths shooting in the same stem?—Not at the same time; if I got the first chance I should like to keep it.

24,131. But suppose a shoal of fish were in the stem, and the men with the small seine were inside the other, would that do any injury?—I never saw it tried, and therefore I cannot say.

24,132. We want to know from you as a practical fisherman whether two people could, or could not use the same stem, having nets of different depths, without interfering with each other?—They might do so sometimes, but we do not like to have the fish disturbed. There might be a little shoal of fish in one part of the stem, and if the small seine went round to catch it it would have a tendency to drive a large shoal out, which I might want to have in my seine berth.

24,133. (*Mr. Lefevre.*) Are the seine nets that are used here of about the same size?—The big seines are all of about the same size. They catch fish in about 11 or 12 fathoms of water.

24,134. (*Professor Huxley.*) Do you think any arrangement could be made by which the small seines could be made to work fairly with the big ones?—Some of our people do not like to speculate on that. All the capital afloat at Newlyn and Mousehole belongs to a parcel of poor fishermen who carry on the fishing on their own capital; to them therefore it is of the utmost importance that they catch fish. The gentlemen who own the seines have plenty of money, and it is not of much consequence to them whether they catch fish or not; it is very different with us; if we did not catch fish in Newlyn and Mousehole we should go very short indeed.

24,135. But suppose a number of poor fishermen choose to invest some of their savings in a small seine, what reason is there why they should not be able to take their turn along with the rest?—I do not know, it is our job to kick against the pricks.

24,136. We have heard the same story in a great number of places. What we want to ascertain and report upon is how far these regulations are for the benefit of the fisheries, not for the benefit of the capitalists. They are two distinct questions, and we

PENZANCE.

J. Kelynack.

31 Mar. 1864.

want to get your opinion as a practical fisherman, whether the working of the small seines would interfere with the fisheries as a whole, or whether they would interfere with the profits of the large capitalists?—I do not know that the small seines would injure the big ones so much as people think, but I as a fisherman with a small capital could better afford to work a small seine than a large one. To carry on the seining on a large scale would require more capital than a mere fisherman could employ, but I do not think that the interference of one seine with the working of the other would be so great as people think.

24,137. (*Mr. Lefevre.*) What is the value of a large seine?—It varies; the first cost of one will be from 500*l.* to 700*l.*

24,138. Are they mostly held by capitalists?—Yes.

24,139. Do any of the large seines belong to the fishermen?—No.

24,140. Have they no share in them?—Very little; there is hardly a fisherman in Newlyn who has part of a seine.

24,141-2. Do most of the boats that drift belong to fishermen?—All the boats and craft here belong to fishermen at Newlyn and Mousehole.

24,143. (*Professor Huxley.*) You have been a huer in connection with a large seine?—Yes.

24,144. Have you ever noticed the shoal of fish broken or dispersed by the use of the drift-nets?—When I was at Mevagissey I never saw a shoal of fish broken up by drift-nets.

24,145. You are aware it is often stated that such is the case?—No doubt; I have received a letter from Mevagissey stating that.

24,146. Is it within your experience that that is the case?—The drift-boats in general do not like to go and interline with the seines; they generally shoot their nets overboard when the evening is over with the seines.

24,147. Do you think it would be a hardship upon the drift-men if the regulation were enforced requiring them to keep a league and a half from the shore?—Yes, I think it would do a great deal of injury. Our coast here abounds in bays where the seines could not work, and a very large quantity of fish would be lost altogether if the drift-boats were obliged to keep off; and when our boats are fishing in the bay they drop a great many fish overboard, which tends to supply the ground with food. I think many people entertain wrong ideas on this point.

24,148. Would there not be some inconvenience if the drift-men were to drift right into the stems? For example, no seiner could shoot his net where drift-men were drifting on the ground?—You must remember that our men do not shoot their nets when it is time for seining; they go into the stem ground in the night time, after the seines have gone away.

24,149. But suppose they have shot their nets two or three miles outside, would not the tide easily drift them into the stems?—Yes, that may happen sometimes.

24,150. If that were so the seines could not shoot?—Our fishing is not managed in the same way as that at Mevagissey. We go on seining on the side. Many people if they see the fish will shoot where the drift-boats are sometimes. We cannot go out in our bay if there happen to be strong tides; we cannot go out to catch pilchards two miles off. In August the fish will come in nearly to Penzance quay, and from that to two miles off; but frequently it is impossible to stand the tide.

24,151. Are you speaking now of drift-fishing?—Yes.

24,152. Then if you were obliged to keep three or four miles out you would catch no fish?—If all our men were kept two miles outside of the Gear Rock we should regard it as the annihilation of our pilchard-catching. We should be obliged to go to Australia or somewhere else.

24,153. Then if the old regulation were enforced here, by which drift-boats are required to keep a league and a half from the shore, you would be positively ruined?—Yes, in the pilchard line.

24,154. (*Mr. Lefevre.*) I think you said that there are three stems off here?—Yes, three westward of Newlyn and two at Mousehole.

24,155. How many are there in Penzance Bay, between here and Mounts Bay?—They are not fishermen here at all; they are merchantmen and shopkeepers.

24,156. Is there no station there?—No, but on the Mount there are three stems.

24,157. There are three on the Mount?—Yes.

24,158. Is there a great deal of ground there that is not fit for seining at all?—Yes.

24,159. Is it rocky?—Yes, and you are sure to get within the headlands in what we call the eddies of the tides. It is of no good to us to go into the headlands; we want to be away. The tides where we shoot our seines overboard are of such a nature that we cannot go out 200 fathoms from the shore at Mousehole to catch pilchards.

The witness withdrew.

G. Downing.

GEORGE DOWNING called and examined.

24,160. (*Professor Huxley.*) Are you a fisherman here, or what is your occupation?—I am very little engaged in the fishing now; I have been a fisherman, but I have not been much engaged in it. The only fishing occupation I follow now is seining for mackerel occasionally.

24,161. Have you been familiar with the fishing here for many years?—Yes.

24,162. How many years have you known Newlyn and been acquainted with the fishing there?—All my time I have been here.

24,163. Is that 40 or 50 years?—No, about 30 years.

24,164. Do you put in the return which has been handed to us?—Yes.

24,165. Have you heard the evidence of the last witness?—Yes.

24,166. Do you agree with it generally, or have you any comments to make upon the statements which he gave to us?—With respect to seining I differ from him very much.

24,167. In what respect do you differ?—The pilchard-seines are required to be of a certain length and depth. If smaller seines were allowed to interfere with them they would destroy the stems.

24,168. What is the regular length of the large seines?—240 fathoms. We count five feet to a fathom.

24,169. What is the depth?—Seventy-two feet. If the smaller seines interfere with the larger class of seines they destroy the stems and berths, because the large seines are supposed to be best calculated for taking the fish. If smaller seines, such as mackerel-seines, were allowed to interfere with them, they would destroy the stems, so far as the larger shoals of fish are concerned.

24,170. But the small seines of which you were speaking just now were not mackerel-seines. They were seines of the same make, but simply smaller?—Yes, but they would interfere with the stems, because they could not go out to a proper depth, and they are not of sufficient length to enclose the large shoals of fish.

24,171. What you mean is this—that they would take up the space necessary for working the larger seines, and yet would not catch the same quantity of fish?—If they took their turns along with the other seines, the bigger seines could not come there to shoot at all in the same stems. That could not be done, and therefore there would be very great interference.

24,172. What is the extent of a stem?—They are divided off by poles.

24,173. What is the width—how many yards?—I never made any calculation; perhaps from 200 to 300 fathoms. Some stems are larger than others.

24,174. Is not the space occupied by a stem much greater than the length of a large seine?—Yes, a great deal more.

24,175. Then they are more than 200 fathoms?—Yes.

24,176. What will the length of a stem be in proportion to the size of the net?—Taking a distance of a mile from Newlyn Pier up to Pelley Point, it is divided into four stems. That would give a quarter of a mile for each, as there are four stems in that distance.

24,177. But in that case the width of a stem is not much greater than the width of the net?—Not much.

24,178. It is about the same?—Yes.

24,179. The length of a net is about 400 yards?—Yes.

24,180. And a quarter of a mile is a little more than 400 yards?—We reckon a fathom as five feet; the stems would therefore be rather larger than the seines.

24,181. But not very much larger?—No, not very much.

24,182. So that in fact there is not much more than sufficient room to shoot your large seine within the width of each stem?—We sometimes shoot two or three seines in a stem when we are taking turns.

24,183. One after the other?—Yes.

24,184. But it would not be possible to shoot them at the same time, because one net will take up nearly the entire width of a stem?—The seines are shot to a round stop; they go round and round. I have sometimes seen five shot one after another.

24,185. Not at the same time?—No, one after another.

24,186. Of course the net when it was brought round to a boat would only take up one third of the space which it would occupy lengthwise?—Yes; perhaps rather more than that, because we moor the seine the same as a vessel is moored with anchors to the tide.

24,187. I only speak at a rough guess. Two or three seines would be as many as you could well shoot, would they not?—I have seen three or four large seines shot in one stem.

24,188. At one time?—Yes.

24,189. In that case it comes back to the old point—what is there to interfere with the large and small seines being shot one after the other?—The only thing is that the small seines are not calculated to go out to the same depth as the large seines.

24,190. Would they not be more out of each other's way if they went out different depths?—You can get the others inside as well as out, and they are better calculated to take the fish.

24,191. But in all other modes in which men pursue the avocations of life they are left to take the means which they think best calculated to benefit themselves. If a man is content to put up with a smaller quantity of fish why should he be interfered with?—He would only be able to take 100 hogsheads, whereas the large seines would take 1000 hogsheads.

24,192. But why, if they were satisfied with 100 hogsheads, should they not be allowed to catch them?—We think that great injury would be done by allowing the other 900 hogsheads to get away.

24,193. But you tell me that in one stem it is practicable for three large seines to be shot one after the other?—Yes.

24,194. If the first operation of shooting the nets does not send away the shoal of fish, and the second and third operation also have no such effect, why instead of shooting three large seines one after the other should you not have first a large seine, then a little one, and then a large one again? What damage would that do?—The small seine would be interfering with and would keep out a seine that would take a larger quantity of fish.

24,195. But if a man is content to put up with a smaller quantity why should he not?—He not only injures himself but he injures those who follow him.

24,196. Those who have to follow get their turns afterwards?—The only reason I have for objecting to it is that the small seine is not calculated to take a heavy shoal of fish; that is my only reason. I certainly think that the working of the small seines in the stems would interfere very seriously with the large seines, and it must be remembered that the owners of the large seines are at a greater cost in keeping up their nets.

24,197. Is it a common occurrence for two or three large seines to be shot in the same turn one after the other?—Yes, all taking their turns regularly.

24,198. Is it a very common thing for three to be shot one after the other?—Yes, that is very common if the fish happen to be coming up.

24,199. Then the operation of shooting the seine does not interfere with the fish or disperse them?—No.

24,200. It does not interfere with their coming into the bay afterwards?—No, but there are no small seines here. The only one I am acquainted with is the one which Mr. Kelynack has referred to in his evidence.

24,201. It does not matter what the seines interfered with are; all we want is to get at the reason for enforcing the regulation?—If a smaller description of seine was allowed to interfere I believe the result would be that we should all have to come to the smaller seines. In my opinion, when the fishing was going on they would be right in the way of the others. They must come in to take their turns with the others.

24,202. You mean that they would compete with the large seines?—Yes.

24,203. You are aware that competition and driving away the fish are two very different things?—Yes, but then the small seines are not calculated to take a heavy shoal of fish, while the large ones are.

24,204. That is their loss?—Yes, but they would prevent another seine from coming in which would be calculated to take a large shoal of fish; that is what I mean. The mackerel-seines sometimes come up when the fishing is going on and interfere, and we think that very objectionable.

24,205. Is there any further remark you wish to make to us in reference to the seining part of the question?—No, I do not know that there is anything else I can say, except that I do not think the small seines are injured by being kept out of the stems. There are berths here from the stems to the Mount, where they can take up their place. There are no stems there.

24,206. Why are there no stems there?—Because it is impossible to divide the coast there into stems.

24,207. Why cannot you divide it into stems?—I do not know how it would be possible to do it; you could not put down buoys, because they would interfere with the fish. It is done by mutual agreement, and the stems are regulated between the huers and the owners. They say now that they are content to have possession of a stem for 24 hours. They used to occupy the stems as long as they thought proper until the seine was shot. If they only shot out a portion of the net then the stem was lost.

24,208. Are you aware whether there is any law giving a right to regulate the seines belonging to the seiners, or is it only a matter of agreement?—Some years ago there was an arrangement entered into upon the matter.

24,209. Between whom was the arrangement made?—Between the fishermen and the seine owners. I have now in my possession a copy of that arrangement. It was made by some authority or other, but I do not know what.

24,210. Will you let us have a copy of that arrangement by-and-by?—Yes, you shall have it at some future time.

PENZANCE.

G. Downing.

31 Mar. 1864.

24,211. (*Mr. Lefevre.*) How long ago is it since the arrangement to which you refer was entered into?—About 20 years ago. It was placed in the hands of Mr. Gurney, and it was handed to me by his son.

24,212. (*Professor Huxley.*) Was it an agreement between the fishermen and the then existing seine owners?—Yes, and it is the authority on which they have acted since. It was drawn up by some of the authorities, but I do not know who they were.

24,213. With regard to the interference of the drift-net fishermen with the seiners, do you think that the drift-nets interfere with the working of the seines?—They do not interfere much with the working of the seines.

24,214. They do not interfere with the profitable working of the seines?—I think not.

24,215. Do they interfere with the fish and prevent them from coming into the bays?—Yes, I think they do. My impression is that they do, and that has always been my impression.

24,216. Have you ever seen a shoal of pilchards broken by shooting the seines among them?—That is not a very easy matter to speak of, but I give it as my opinion that it does occasionally happen.

24,217. You have handed in a return in reference to the pilchard-fishery?—Yes.

24,218. How many boats are there engaged in the pilchard-fishery according to that return?—121 apparently.

24,219. There are 50 at Portleven and 40 at Mousehole?—Yes.

24,220. That makes 90?—Yes.

24,221. Are the whole of those boats with the exception of a few which go to the North Sea at home during the pilchard season?—There may be 20 or 30 in the North Sea less than the number here now, but all of them are employed in the pilchard fishery in August.

24,222. Then you have probably as many as 120 boats engaged in catching pilchards in the season?—Yes, and I think there are even more than that. The total number of boats according to this return is 295.

24,223. That is the total number of boats of all kinds?—Yes.

24,224. I thought you were speaking of pilchard-boats only?—They are all employed in catching pilchards during the season.

24,225. Are there as many as 250 pilchard-boats?—Yes.

24,226. Two hundred and fifty pilchard drift-boats?—They are boats that go to the pilchard-fishery. There are from 200 to 250 boats constantly shooting every night when the pilchard season is on.

24,227. Are you of opinion that they do any injury to the shoals of fish?—In my opinion they break the shoals of fish and scatter them. That is my deliberate opinion. I do not know whether I am right or not, but I am bound to give you that as my opinion.

24,228. Do the drift-boats bring in all their fish every morning?—Generally they bring them in every day, because it would not do to keep them out. Occasionally when they go out to the deep sea they may keep them over for a day.

24,229. What becomes of those fish? Are they principally cured, or bought by the hawkers for home consumption?—They are principally dry-salted and exported.

24,230. The fish caught in the drift-nets are salted and exported?—Yes, they are dry-salted, packed in casks, and sent to the Mediterranean for consumption in the Italian states. I think there were as many as 3,000 hogsheads sent off from Newlyn and Mousehole in the course of last summer.

24,231. Are they not purchased by the hawkers?—Yes, some of them are, but no great proportion of the whole quantity.

24,232. No large proportion is bought for the supply of the country?—No; sometimes the farmers and townspeople buy a few. For instance, if there are only 200, 300, 400, or 500 hogsheads caught then the whole of them are taken up for the supply of the country people.

24,233. Do they use the fish caught in the drift-nets as freely for salting as they do the fish caught by the seines?—I think not. I believe they would use them more freely for home consumption. They would sooner have the drift-fish than the seine-fish for home consumption.

24,234. They prefer them in a general way?—Yes.

24,235. Can you say why that is?—I believe that in general they are rather larger fish.

24,236. The drift-nets catch larger fish than the seines?—Yes.

24,237. Do they cure as well as the seine-caught fish?—Yes, they cure equally as well.

24,238. And do they fetch the same price?—If the fishermen should fancy that they could make a better price by salting them than by selling them fresh for home consumption, you may depend upon it they would do so. If the price suited them they would hold them and salt them, but otherwise they would get rid of them at once by selling them fresh.

24,239. Do the drift-fish fetch the same price in the home market as the seine-fish?—Yes, they bring equally as high a price.

24,240. There is no particular difference either way?—No, none at all.

24,241. Then with regard to the seine-fish salted in the same way, are they generally exported?—Yes, most of them are.

24,242. Are the whole of them?—I cannot say that the whole of them are; there may be a few baskets sold fresh.

24,243. But the great proportion is salted and exported?—Yes, they make a sale of them for the foreign market in a general way.

24,244. Then the market for home consumption in Cornwall is supplied more by the drift-fishermen than by the seiners?—Yes, certainly. It is supplied far more by the drift-net men than by the seiners, and, the reason is that the seine-fishing only lasts for a very short time. The drift-fishery is carried on for two months or 10 weeks, and the market is being constantly supplied in that way.

24,245. Then the steady supply to the market is derived from the drift-fishermen?—Yes, there are two or three companies, one at the Land's End, one at Penberth, and one at Gurnards Head, who sell to the country when the shoal of fish comes to 100*l.* or 200*l.* worth; but that is not the case here, as the market is supplied with fresh fish by the drift-net fishing every day.

24,246. Would it be any particular hardship to the drift-men if they were kept outside the limits prescribed by the old Act, namely, a league and a half?—I think if that regulation was enforced it would destroy the drift-net fishermen altogether.

24,247. It would be ruinous to their interests?—Yes, it would shut them up altogether.

24,248. Then do you think that their interference with the seine-fishing is so great as to demand any restriction?—They should be kept outside of the seiners.

24,249. Do they interfere so much with the seine-fishing as to render it necessary that there should be any restriction placed upon them?—The only opinion I have upon that matter is that they ought not to be allowed to come in when the seines are working. At such times, when the fish are in the bay, they come in too near; that is the only objection I have to them.

24,250. You think they ought not to be allowed to interfere with the people who are engaged in working the seines?—Yes, they come in much too near. They come in within reach of the ground where the seiners should be working their nets.

24,251. Then would your views be met by some regulation obliging the drift-net men to keep off while the seines are actually working?—Yes, at such times they should be obliged to keep outside for a certain distance.

24,252–3. What distance do you think they should be required to keep off?—They should be obliged to keep off as far as 16 fathoms of water. There was a regulation made to that effect some time ago, and I was one of the persons who agreed to it.

23,254. Can you describe the general nature of that agreement?—I hardly remember anything at all about it now, but I believe the regulation laid down was the result of a mutual agreement between the seine-owners and the fishermen that the drift-boats should not come within less than 16 fathoms of water.

24,255. Was that as far as the seines could go out?—Yes, our seines could not shoot beyond that depth. If that regulation were observed there would be sufficient room both for the drift-net men and the seiners.

24,256. Do you think that the adoption of a regulation of that kind would not interfere very much with the interests of the fishermen?—I think not.

24,257. Is there any other branch of the fishery in reference to which you wish to make a remark?—I do not know that there is. I may say, however, that with regard to the pilchards themselves, they are in my opinion a native fish of Cornwall.

24,258. You think that they are a native fish?—Yes.

24,259. That they do not migrate?—I think not.

24,260. Then in your opinion what becomes of them when they appear to vanish?—My opinion is that they take their winter quarters in the English Channel about the Eddystone, and they break off after Christmas and go away south or south-west. If you examine the fishermen who are out with the mackerel-boats in the months of May and June driving about 10 or 12 leagues off the coast, or perhaps even further, they will tell you that they frequently pick up a great number of large pilchards. They call them spawning pilchards. My opinion is that they spawn out at that distance.

24,261. At what time of the year do you think they spawn?—They spawn in May and June. After those months we find that they strike the land on this side of the Land's End, while some of them go on the other side into the North Channel. We have here what we call a summer fishing for pilchards. They set in towards the shore in the summer time, and they would remain here if they were not interfered with. They used to come regularly at a certain state of the spring tides and visit us for a short time before there was so much drifting, but we do not have them come in now like that; we get them for a night or two only. I cannot tell what the cause of that is. I believe that they go then into the North Channel and strike the Irish shore. They will not go into the wide open water; pilchards do not seem to like it. They then come south and strike the Channel at New Quay and St. Ives; they then cast away round the Land's End and go round to find their winter quarters. My own opinion is that the pilchards spawn out at sea and the mackerel too.

24,262. The pilchards when they visit the coast here are not full?—No, but they have been here very full. They visited our shores a year or two ago in that condition, after they had left Plymouth. It was said that they came here for the purpose of spawning. They did come here and spawn for two or three years running. The firing of guns, we think, is not good for the fisheries; the shock disturbs the fish, there is no question of that.

24,263. (*Mr. Lefevre.*) Do you agree with the last witness that the drift-boats set their nets mainly within two miles of the coast?—Yes, they mostly set them about two miles from the shore; half of their time they are within two miles, or perhaps a little more. They commence their fishing about two or three leagues off.

24,264. When does the drift-net fishing begin?—It begins soon after midsummer.

24,265. And as the season goes on do they follow the fish in?—Yes.

24,266. I understand you to say that in your opinion one half of the fishing takes place within two miles of the coast?—Yes; the best half of it takes place within two miles of the coast.

24,267. Do they often set their nets in water less than 16 fathoms deep?—Very seldom; they will not set them there unless they see the fish.

24,268. But the fish, I suppose, are often in water less than 16 fathoms deep?—Yes.

24,269. Do the drift-boats follow them there?—They have done so.

24,270. Do you recollect the seining here previous to the arrangement you have spoken of?—Yes.

24,271. About 20 years ago?—Yes.

24,272. Were there more seines in use then than now?—I do not know that there were many more seines in use then than there are now; but you will find the number included in the return which I have handed in.

24,273. Were the seines of different sizes then?—They were much the same as they are now; they were no larger.

24,274. But at that time were they all of one size?—Yes.

24,275. There were no small seines in use then?—No; I never knew of any small seine except the one which was named by Mr. Kelynack.

24,276. Do you know how many men are employed here in seining in the course of a season?—Of late years there have been very few men employed indeed.

24,277. Was last year a good year for the seine-nets?—No, we have not had any fish here of any consequence for the last 10 years.

24,278. Has not the fishing improved in any respect within the last 10 years?—Not with us. We have scarcely had any good takes of fish within the last 10 years.

24,279. There has been very good fishing, I believe, off St. Ives?—Yes, they have been all right there. They have been working the fish very well.

24,280. How many men were employed here this last year in seining?—About 100 men.

24,281. Does that include the number employed all over the district between this place and the Land's End?—It includes from the Lizard Point to the Land's End.

24,282. Are there more fish altogether, in quantity, brought in by the drift-boats than by the seine-nets in the course of the year?—We have had nothing much to speak of with the seine-nets for the last 10 years.

24,283. Have the drift-nets done better?—Yes, very much better.

24,284. What has been their catch?—They have brought in from 2,000 to 3,000 hogsheads every year.

24,285. Then the supply from the drift-boats has been pretty regular?—Yes, pretty regular. Last year the drift-fishing was most productive.

24,286. Then if it had not been for the drift-boats there would not have been many pilchards brought in?—No, scarcely any at all.

24,287. Have not the seine-nets had a single good year during the last 10 years?—There has been nothing to complain of during the last 10 years with regard to the drift-nets.

24,288. Have you had one good year with the seine-nets during that time?—Very little, taking it altogether. There was one shoal or two, but that was all; there was nothing of any consequence.

The witness withrew.

JOHN ADAMS called and examined.

J. Adams.

24,289. (*Professor Huxley.*) Are you a fisherman here?—I have been a fisherman for the last 30 years.

24,290. Have you been a fisherman at Penzance, or at Newlyn?—At Newlyn.

24,291–2. Do you agree generally with what has been stated by the previous witnesses, or are there any points on which you wish to make a remark?—I agree with those who have spoken of the necessity

PENZANCE.

J. Adams.

31 Mar. 1864.

of requiring the drift-fishermen to keep out for a certain distance, so that they should not do injury to the seiners when the fish are in the bay. I can confirm what the last witness said in reference to an arrangement having been made. They did infringe a little upon the seiners at that time.

24,293. What is the time you refer to?—In the month of August, when the seines went to sea. The seine owners left it to the huers to try and make some arrangement, and it was finally agreed that the drift-boats should be confined to 16 fathoms.

24,294. They were not to be allowed to come with their drift-nets within 16 fathoms of water?—No. We can shoot a seine in 13 fathoms of water, but we could not hold it there with the tide.

24,295. What is the greatest extent you can go?—Eleven or 12 fathoms is the greatest extent to which we can go, and then it must be a very easy tide indeed. The boats confine themselves to that. All the time I was a huer, and I was a huer for 20 years, I heard no complaint with regard to the drift-boats. They do not shoot until after what we consider to be the seining hours are up. After we cannot see the colour of the fish from the hill we give up seining. We do not practise that mode of fishing at night.

24,296. You do not seine at night?—No, we never carried on seining in Mounts Bay at night. I have been out in the winter season and in the autumn, when the summer fish have been coming back.

24,297. The drift-net men do not work in the daytime?—No.

24,298. Then how do the seine-men and the drift-net men interfere with each other?—They come out in the daytime sometimes when the fish are there, and they approach too near. Some of them also began to shoot a little early, but that was done away with when they agreed to compromise the matter with the seine owners by not coming within 16 fathoms.

24,299. How did you compromise the matter? What law was there on the subject?—None at all, and there was none with respect to the stations, except an arrangement among the men themselves as to the extent of the stems. Afterwards we put up two poles to define the stems. If I was on the hill looking out for the fish I should not be able to tell how near they were to the stem. If they entered half way in it the seiner would lose the stem, and perhaps lose thousands of pounds worth of fish. As soon as the seiners reached the two poles he was obliged to stop his boat, and then the next one in turn would take the stem.

24,300. Are you able to say, as a practical seiner, that it is necessary to enforce the old regulation as to keeping the drift-men off for a league and a half?—If that were done it would be tantamount to prohibiting them from getting a living altogether.

24,301. Do you think that the damage done by the drift-men to the seiners is so clearly made out that it forms a justification for taking so extreme a measure as that?—I think not. I do not think that the drift-men do any damage to the seiners. The fish are naturally scattered in the night, and collect again in the daytime. I believe every fisherman will agree with that. It is very seldom that we see anything in the shape of a large shoal of pilchards taken in the morning. But sometimes in the afternoon I have been in the bay and seen them passing up as we call it to "colour." They present a red appearance when seen in clear water. I have seen them pass up in the afternoon much thicker than in the early part of the day. After dinner the shoal is generally much heavier than before.

24,302. Do you think that the drift-net men have often broken a shoal and dispersed it by setting their nets?—They never do so in the daylight, and of course if they did so at night-time they could not help it.

24,303. Is there any evidence that they do it at night?—I never saw it done except upon one occasoin and that was in the afternoon. The fish then would not go into the nets.

24,304. If they shot their nets by day, and by so doing were to disperse the shoal, they would do no good to themselves?—No, not a single fish would go into the nets. With respect to the drift-fishery I may add that the drift-nets allow all the small fish to pass through, and the fish caught by the drift-nets and sent to the Mediterranean are much larger than those caught by the seine-nets. The reason of this is that the seine stops everything, while the small fish go through the drift-net. You cannot put more than the first joint of your finger in the mesh of the seine-net.

24,305. Have you seen large quantities of small fish caught by the seines?—Yes, and I have seen them sent away for manure. I have seen them brought up and sold on the shore for manure.

24,306. Were they small pilchards, or small fish of other descriptions?—They were principally small pilchards, but I have seen other kinds of fish caught and sold for manure.

24,307. What descriptions of fish?—What we generally call scad or horse-mackerel.

24,308. When the seine takes a large shoal of pilchards, do you find that they are almost all pilchards?—They are sometimes mixed up with scad.

24,309. Are there any other kinds of fish with them?—Very rarely; they are generally all pilchards in what we consider a compact shoal of pilchards.

24,310. But you may take a great quantity of young pilchards?—Yes, and sometimes not one out of 500 will be fit for saving.

24,311. (*Mr. Lefevre.*) Do you sometimes find a shoal consisting entirely of young pilchards?—Yes, they have been here, at times, for the whole of a season about the size of sardines, such as those which are found in the Mediterranean.

24,312. (*Professor Huxley.*) Are they like sardines?—In fact sardines are pilchards; I have examined them both at Marseilles and Leghorn, and I am satisfied that they are nothing but pilchards.

24,313. Is that all you wish to say about the question of drift-net fishing?—All I wish to say is that if the drift-men are compelled to keep two miles off, it will amount to a prohibition upon their fishing altogether; they would not be able to earn a living out of it. It should also be borne in mind that the men who are employed at the drift-fishing are all accustomed to the sea, which is not the case with regard to those engaged in seining. The drift-fishery is a great nursery for fishermen, whereas, with regard to the seine-men, if they can pull an oar it is all that is required of them. They are only employed occasionally; sometimes there are four of them and sometimes six of them employed in each boat, and they are disbanded after the season is over.

24,314. (*Mr. Lefevre.*) Are they mostly landsmen who are employed in the seine-boats?—They are all landsmen, except a particular man or two who go to the fishery thinking the wages they get are more remunerative to them during the season.

24,315. (*Professor Huxley.*) With regard to the question of turns, do you think it is objectionable that a large and a small seine should work together?—I think it would be detrimental in that respect; a large shoal may be coming up, and a small seine may attempt to take it without being able to succeed; the only result will be that they will disturb the fish, which will disappear and never come again. I have seen the seines shooting when the fish were as red as blood for colour. We give as near a guess as we can in rounding them. There may be 500 or 1,000 hogsheads of fish in about 10 or 11 fathoms of water, but instead of rising they may go down upon the ground, and you cannot see more colour than you can here. The mischief would be for a little seine in such a case to attempt to enclose the shoal; there would be more fish than they could possibly take, and thousands of hogsheads would be lost entirely through their interference. We never found that they were here long enough to afford to lose them in that way.

24,316. We have been given to understand that in

one and the same place and in the same shoal a large seine may shoot and take its share, when another seine may follow and shoot also and take its share?—That would be the case at St. Ives and Mullion, but it is not the case generally; there are frequently from 50 to 500 or 1,000 and 1,500 hogsheads in a shoal, and they follow along as if guided by a line.

24,317. Do you think that the operation of a small seine would be that it would only catch a part of a shoal and drive away the rest?—That is the only injury they would do, but that I conceive would be a very material injury.

24,318. That is inconsistent with the notion that two or three large seines can be shot one after another without breaking the shoal?—They are enabled to do that sometimes; I have seen a shoal of fish come in over three miles long, that would be enough for all the seines in the bay to shoot.

24,319. Has a shoal like that been taken up by the seine?—No, that would be too vast a shoal to take up altogether; but in such a case at St. Ives I believe that almost all the seines have shot and taken a piece out of the shoal.

24,320. Without dispersing the shoal?—Yes, they formed almost a solid body of fish, the depth of the water caused them to raise each other entirely out of the water where it was shallow.

24,321. If breaking the shoal disperses it, it would not be of much use for the man who had the second turn to shoot?—But another shoal might come up, the same shoal would not rise again in that stem. It would rise to the westward of it, and if there were strong tides it would prevent them from working the seines. They could not shoot after a four hours flood unless it is in very shallow water indeed, and by the time they were ready to shoot the shoal of fish would be entirely gone. To show you how a small seine would work, I may say that if a shoal of about 1,000 hogsheads came near a small seine, it would only be able to take out of that about 200 or 300 hogsheads, whereas a large seine would enclose the whole.

24,322. What made the fishermen fix upon that particular length of 240 fathoms for the size of the seine?—I believe the largest seines are somewhere about that size, but we only reckon five feet to the fathom. I do not know how that has been arranged, but it is so here.

24,323. Then a large seine will be 1,200 feet long?—Yes, that is as much as a boat will carry comfortably. If we had a larger seine we should require larger boats, and that would incommode us very much. If the seines were 300 fathoms long I do not think they would take much more fish than they do now.

24,324. Then fixing the length at 1,200 feet is simply a matter of practical convenience?—Yes; I suppose that the first persons who had seines had those which they thought the most convenient. I believe at St. Ives they are confined by Act of Parliament to a particular length.

24,325. Is there any Act of Parliament upon the subject that you are acquainted with?—Yes, at St. Ives.

24,326. But not here?—No, there is nothing but custom here; it is only the largest seines that are 240 fathoms long. Some of them are not so long as that by 30 fathoms.

24,327. Are you of opinion that the yield of fish here has been falling off generally in the way you described?—I think it has; for instance, the ling and conger used to be caught here in great abundance when I was a boy, and now there are scarcely any caught at all.

24,328. How do you account for that?—I think it has been caused by the destruction of the small fry, some of them no bigger than my thumb, by what we call the foot-seines.

24,329. Are there a great number of these seines here now?—We have a few on the Eastern ground between Penzance and the Mount on the sand there.

24,330. Has the number increased or fallen off of late years?—It has fallen off considerably; I think at one time there were 10 at Newlyn, and I believe there are not more than one or two now, and even these are very seldom used.

24,331. Has the quantity of fish increased since the use of the foot-seine dropped off?—I do not think it has. A few years ago they began to find that kind of seaweed which they find useful for growing early crops, such as potatoes. I have seen it on the beach from six to eight or 10 feet deep. It was left on the surface to rot, and there were thousands of worms in it. The fish were in the habit of coming in to feed on it. They now use it for manure, and in order to obtain it when it is in places which they cannot reach by hand, they employ long poles with scythes at the end, and cut it off in 18 and 20 feet of water. Whether that does any injury I do not know.

24,332. Is there anything else that in your opinion has done any injury?—I believe the trawling has done a great deal of injury. When we had an immense lot of ling here I believe they were in the habit of spawning here, but the spawn was torn up by the trawlers and the fish were destroyed.

24,333. What is the largest quantity of fish you have ever seen taken with the pilchard-seine?—The largest quantity I have ever seen taken up in a seine, or rather the largest quantity I ever had anything to do with myself, was 950 hogsheads. I believe, however, that Mr. Kelynack, the witness who was examined first here to-day, took a larger shoal than that; and down at St. Ives I believe that Mr. Bolitho's seine took 5,500 hogsheads at one catch.

24,334. Are some of the shoals too long to shoot round?—Sometimes two seines will act together, and they will bring out the mackerel-seines, and enclose the whole of the shoal.

24,335. (*Mr. Lefevre.*) Have you yourself any interest in a seine-net?—Yes.

24,336. Have you long had that interest?—Yes, for the last 20 years.

24,337. What is the amount of your interest?—My part is only very small. Mr. Davy owns the most of her. I have the $\frac{1}{16}$ part of one seine now.

24,338. Have you found during the last 10 years that the amount of money you have derived from it has fallen off?—Since I have had that seine, taking into account all she has caught, I think I shall be about 30*l.* out of pocket in the shape of loss, perhaps more. I do not think that Mount's Bay has been remunerative for seining not as a whole for the last 20 years. Perhaps in the course of those 20 years, if you take all the seines together, you will find that some particular seine has done better than others, but as a whole I think seining has not paid here.

24,339. During all that time?—Yes, I believe so. I believe there were also fluctuations years ago, for I have heard my father say that there have been seven, eight, and 10 years together when there has hardly been any fish in Mount's Bay.

24,340. How long back does that refer to?—Seventy, 80, or 100 years ago. I have heard my father-in-law say (and if he were alive now he would be over 90 years old) that three times he was obliged to leave Newlyn, and go to sea in merchant vessels, because he could not get a living there from pilchards or mackerel, or any other fish. They had fallen off altogether.

24,341. That is 70 or 80 years ago?—Yes.

24,342. Has the number of seines fallen off since that time?—I believe the same number of seines has been kept up, but they are not all put in the sea every year. The seines here hardly pay the men's wages by the fish they get. Seining here has been a dead loss for the last seven years. During that period I do not know of any seine that has taken 100 hogsheads of fish at a time.

24,343. Have the seines always been of the same size?—Yes.

24,344. No small ones have been used?—No.

24,345. What is the cost of keeping up a seine, say for a year?—Do you include wear and tear and everything?

PENZANCE.

J. Adams.

31 Mar. 1864.

24,346. Yes.—That depends upon the amount of damage they get. A man cannot put the seine on board the boat I should say for less than 7*l.* or 8*l.* It will cost him that to put her on board and lay her up, and to employ one man to look after her. No man has been paid wages here for the last few years; they have been paid by shares.

24,347. What is the average cost of repairing the seine year by year?—The cost of making a new seine will come to about 500*l.* or 600*l.* The cost of repairing it will of course depend entirely on the amount of damage it has received.

24,348. But taking one year with another what would you put down as the cost of repairing a seine?—Taking one year with another, even if the seine were laying by, I should calculate 20*l.* a year upon it; it would not be much less than that.

24,349. How long, according to your calculation, will a seine last?—We are always renewing them little by little. A seine ought to be shot three or four times a year. It should last in the first instance perhaps 10 or 12 years.

24,350. Would a small seine pay as much in proportion as a large one?—The objection I have to them is that they would interfere with the large seines by cutting up the shoals; that is the only reason why I would not allow them to work with the large ones.

24,351. Would the fishermen generally find it more convenient to use the small seine?—I do not think they would.

24,352. Not if they were allowed to have their turns with the others?—I think not.

24,353. Why not?—They would find that they would require as a general rule much more seine-net than they would have in their boats. It is very seldom that we see a shoal of fish, when we are using the large seines, and find that we have any seine to spare after enclosing it. If the fish come up in one direction and are going off again we put off to enclose them, but if they get foul of the net and we find that we have not enough seine to enclose them, another seine may take our place.

24,354. What distance from the shore do you shoot your seines?—From Newlyn to the Mount about half a mile off, where it is very flat; in some places much less.

24,355. Further towards the Land's End how far do you go out?—They can go out for half a mile there, but between Newlyn and Mousehole they cannot go further than 700 or 800 yards from the shore.

24,356. Does the shore there shelve very rapidly?—Yes.

25,357. I suppose in such places the small seines would only be able to go out a very short distance?—If they were the same depth as the other seines they would be able to go out as far, but their chance of enclosing a vast shoal of fish would be much less. The evil would be that though they might probably succeed in cutting off a piece of the shoal the remainder would dip, and we should never see it again.

24,358. Are the seines nearly all of one depth?—Yes, nearly all of them.

24,359. What is the depth?—They are about 70 feet deep.

24,360. Are all of them of that depth?—No, only the deepest.

24,361. When you enclose the shoal of pilchards do you find that the fish you take are nearly all of the same size?—They vary vary much, some may be large and some small.

24,362. Do you mostly get fish of the same size in the shoal?—No, not always.

24,363. Do you find small ones mixed up with the large ones?—There is a great deal of small ones with the large, that is the case mostly.

24,364. Are the small ones sorted from the large ones afterwards?—They are put in the bulk together, and are all salted together. If there are any small ones, very small, they are selected and taken out when they have been cured properly for the Mediterranean markets.

24,365. What is done with the small fish?—They are sometimes sent to the Mediterranean, and marked "small" on the cask, and sometimes they are sold to hawkers who take them about the country.

24,366. Are the fish sold on the beach?—When the seines are shot here they are taken up by baskets into the drift-boats, and brought ashore from the eastern part of the bay. The men who carry the fish get one-fifth part for carrying them, and from Newlyn to Mousehole they get one-sixth part for carrying.

24,367. Were are they carried?—To the cellars where they are cured.

24,368. Is there a large export of cured fish here?—Mr. Bolitho, who is here, will better be able to tell you about that; he buys them all.

The witness withdrew.

J. Green.

JOSEPH GREEN called and examined.

24,369. (*Professor Huxley.*) Are you a fisherman?—I have served about three seven years to it, and I have been the master of a pilchard-boat, master of a mackerel-boat, master of a pilchard-seine, master of a ground-seine, and of every other kind of net, I believe, that is put into the salt water.

24,370. Are you a native of Newlyn?—I am a native of St. Mawes, but I have been living here for the last 20 years.

24,371–2. I believe you wish to make some remarks upon the evidence which has already been delivered?—Yes; I want to say a word or two about the pilchard seines. I was master of a pilchard-seine the year before last and last year. Last year there was a shoal of fish coming along, and one of these small seines interfered; she shot in among one of the shoals of fish, the shoal knocked against the seine, and away they all went; the large seines had no chance, and the fish were not secured at all.

24,373. Was the shoal of fish entirely lost?—Yes, it all went away; last year I saw another collision.

24,374. What was that?—A small seine wished to hold her stem, and a large seine which was already there contended that she had no right to hold a stem. It could hardly be called a regular pilchard-seine. It was a mackerel-seine with a little Dungarvan net put in the middle of it. A shoal of fish came in, and the large seine put off with her boat to shoot round the shoal, when off went the other, and rowed across her bow; both contended for it, and the result was that the shoal of fish passed, and was not caught at all. Last year I saw the same seine with a little more Dungarvan net in it. Those in charge of it shot round a shoal of fish after the other seine had shot. They meshed so in the pilchard meshes that they were obliged to put kegs round the pilchard-net to keep her up. They got her in, however, and moored the seine. They took up about 70 or 80 hogsheads, and they had about 30 meshed in the meshes. All these fish remained in the water for three days, and when they were taken up they were useless, and were sold for manure; they were all entirely destroyed. Now I contend that such seining as that ought not to be allowed to come in competition with the large seines. If it is allowed to go on I know that the result will be in many cases to throw away the shoal of fish, so that no person will be the better for it.

24,375. In the case to which you referred just now, when the large seine shot first, and the little one afterwards, it did not appear that the shooting of the large seine had the effect of breaking up the shoal of fish?—Not at that period.

24,376. The shooting of the large seine did not break up the shoal?—No; they got their shoal. There were two seines shot, and they got about 1,400

hogsheads each. Those seines were got in out of the way, and then it was that they shot the little seine.

24,377. The shooting of the large seine did not break up the shoal?—No, each seine got its share, about 1,400 or 1,500 hogsheads each.

24,378. Was it another shoal of fish that the small seine attemped to take?—Yes, the small seine tried for another shoal, but it only succeeded in enclosing a part of it. Altogether it destroyed about 30 hogsheads, and took up from 60 to 70 hogsheads.

24,379. Was the small shoal a distinct shoal or part of the same shoal taken up by the large seines?—It was a disitnct shoal. There were two seines in the stem in the first instance. They both of them shot, and were then hauled in out of the way. It was then that the little seine was shot.

24,380. The small seine tried to take a distinct shoal?—Yes, and it destroyed about 30 hogsheads of fish. They were left dead in the net. They remained in the water for about three days and were then sold for manure.

24,381. I understood you to say that that arose from their not having a proper pilchard-seine?—Yes.

24,382. Apparently it did not depend upon the length of the seine?—No, not in that case, but still I contend that a small seine cannot enclose a large shoal of fish. There was a small seine shot in Gerrans Bay last year; there was a small seine and a large one contending together when a shoal of fish came along. They shot away the small seine. The fish came up, knocked up the foot-rope of the seine, which was not sufficient to stand against the quantity of fish, and away went all the pilchards; neither one net nor the other got anything. I have seen several contentions of that kind, and I am of opinion that the small seines only injure the large ones, and do no good to themselves. Such is my opinion, and it is the result of some experience. A seine properly fitted to hold the stem ought to be not less than 180 fathoms long and 12 fathoms deep.

24,383. Is not that less than the seines used here?—As a general rule they are 200 fathoms long.

24,384. And what is the depth?—About 13 fathoms deep.

24,385. But you think a smaller seine is sufficient for holding a stem?—I think a seine 180 fathoms long and 12 fathoms deep is the smallest that ought to be allowed. It is as small as can be used if you want to enclose anything like a shoal of fish. No smaller seine than that ought to be allowed to hold a stem or turn on equal terms with the larger seines.

24,386. Do you think that the use of smaller seines than that is occasionally wasteful?—Yes, it destroys the fish, and it injures those who are entitled to hold a regular stem with the large seines. They do an injury to the large seines, and they cannot benefit themselves, because they are not sufficient to enclose and retain a shoal of fish if they meet with it.

24,387. Is there any other matter on which you wish to make a remark?—I should like to say a word or two with regard to the oyster fishery; I have been engaged in that for several years.

24,388. Is there an oyster fishery here?—No, at Falmouth, where I belong.

24,389. What do you wish to say about the oysters?—I think that each oyster will take about four years from the time it is spawned until it becomes saleable, and fit for market. Since I can remember Falmouth Harbour you could go out and in the course of two hours catch a boatload of oysters. I have known my father throw his dredge overboard 17 times, and take up 17 tubs of oysters. Now in Falmouth Harbour it will take two men a whole day to catch one docker.

24,390. What is that?—That is about one-third of a tub. I think the dredging for many years past has been practised during too many months of the year; they have been dredging eight months out of the 12. The oyster spawns in the summer months; they spawn in the four summer months, and about the 1st of September they are about the size of the nail of my finger, and quite thin. The least touch at that time breaks the shell, it is only just caught together, yet they commence dredging on the 1st of September, and they haul up all these little things. They generally stick to shells or hard substances, such as old bottles. They are then what we call cultch, yet the dredges haul up this cultch from the bottom. The dredge is emptied on board, and the brood is cleared off with a stick or trowel, a few oysters are picked out, and the rest are trampled about or thrown overboard. Now this little spawn is not hardy enough to stand that; it becomes broken, and is almost entirely destroyed. Now I think that instead of dredging for eight months, four months out of the 12 would be quite sufficient for dredging. If the close months lasted a couple or three months longer all this spawn would become hard enough to stand the knocking about and rattling it gets, and when it was thrown overboard it would still live.

24,391. I gather from what you say that you would prolong the fence months?—Yes.

24,392. How many months would you make fence months?—They begin to dredge now on the 1st of September, just when the spawn has begun to adhere to the shells.

24,393. How much longer would you make the fence months?—I think four months in the year would be quite enough for dredging.

24,394. During what months would you allow the dredging to take place?—They dredge now all through September, but I would not allow them to begin to dredge until November; the spawn spat ought to have quite three months to enable it to get hardened.

24,395. Would you still keep May as a fence month?—Yes; that is not dredging time, it is spawning time.

24,396. During what months would you allow dredging to take place?—November and December, yet I hardly think I would begin in November; I would not allow them to dredge until the 1st of December; they might dredge all through January, February, and March, and then they ought to stop altogether.

24,397. Is there any oyster-fishing about here?—No; there are a few about the bottom of the Logan river, and a few come about here and get in the holes in the quay. I believe there are some oysters about parts of the bay if they could be found out.

24,398. But there is no dredging carried on here?—No.

24,399. Is there any other matter that occurs to you upon which you wish to make a remark?—With regard to the pilchard-driving, I have been at that for several years. I think that the pilchard-drivers ought to have some limit; I would not say that they should be driven 10 miles off the land, but they ought not to be allowed to interfere with the turns set apart for the seines; they should be kept outside the stems altogether.

24,400. Have you known injury done in that way?—I have myself shot my nets in the evening before the sun has gone down, and I have seen a shoal of fish come along and strike the nets, some have gone over the net, and some under, and perhaps 2,000 or 3,000 have meshed themselves. Of course in a case like that where the fish strike against the nets in that way the tendency is to break the shoal.

24,401. How far off would you keep the drift-nets?—When I was engaged in pilchard-driving I was not allowed to come within three miles of the land.

24,402. Do you think the drift-boats ought to be kept three miles out?—I will not say that they ought to go as far out as that, but I would order them to keep outside the turns where the seines are used; that would be about a mile from the land.

24,403. You say that when you were pilchard-driving you were prevented from coming within three miles of the land?—Yes.

PENZANCE.

J. Green.

31 Mar. 1864.

24,404. Who prevented you?—The seine owners would not allow it.

24,405. Did you ever hear of anybody being prosecuted for using the drift-nets within three miles of the land?—Yes, I have heard of that.

24,406. Where did it take place?—At Mevagissey.

24,407. Did the prosecutions come to anything?—I do not recollect, but we used to take care to keep outside. The cutter was always on the look out and we kept outside the limits.

24,408. Do you ever recollect anybody being convicted for using the drift-nets within three miles of the shore?—I remember one case in which the boat with its nets and everything else was taken away.

24,409. Was that in consequence of the conviction?—No, it was taken away because the nets were shot inside the limits.

24,410. Were the boat and nets seized as the result of a conviction before the magistrates?—I cannot say whether the men were brought before the magistrates or not, but the Revenue cutter took the boat and the nets.

24,411. Did they afterwards give them back to the drift-men?—I cannot say.

24,412. How many years is that ago?—It is several years ago.

24,413. How many?—I cannot say how many.

24,414. (*Mr. Lefevre.*) How long is it since you yourself were engaged in fishing?—I was at the pilchard-fishing last year.

24,415. Were you captain of a mackerel-boat then?—I was master of a seine-net then.

24,416. How long is it since you were out after mackerel?—I have not been out after mackerel for some time.

24,417. Is it several years ago?—Yes.

24,418. Then you cannot speak with much certainty as to the state of the mackerel fishery?—I do not see that the mackerel fishery does any injury at all.

24,419. Has it increased or diminished?—It has diminished.

24,420. Do many boats come here from a distance after the mackerel?—There are a great many driving-boats here at times, but I do not know that I can give you any satisfactory account of the diminution of mackerel.

24,421. Do the Ramsgate and Hastings boats come here after mackerel?—Yes, sometimes.

24,422. And do they come from the east coast?—Yes.

24,423. Do any Frenchmen come here?—They do not come here driving, but they go to the Scilly Islands and round that coast driving. There is one remark more I would like to make.

24,424. What is it?—It has reference to the trawlers. Some years ago I was at St. Mawes when a fleet of trawlers came in; I happened to be in company with one of the masters of the trawlers, and he said "Now we have destroyed all the fishing be-"tween Falmouth and as far up as we can trawl, and "now we are going down to Mount's Bay, and we "shall soon shut up their shop."

24,425. How long ago was that?—24 or 25 years ago.

24,426. Have they been going on fishing in that part ever since that?—Do you mean the trawl-boats?

24,427. Yes.—Yes, they have.

24,428. Then it would not appear that they have spoiled their own fishing?—All I know is that the master who made that remark to me said that one trawl would destroy more in the course of 12 months than all the other nets that are put into the salt water; he said, "I have myself been hauling up in the trawl "as much as three tons of spawn at a time; I have "found it sticking all over the trawl, and we have "taken trowels and sticks and beaten it off on to the "deck; it is then trampled upon, shovelled overboard, "and all killed; one trawl," said he, "will destroy "more fish in the course of 12 months than every "other kind of net put into the salt water."

24,429. (*Professor Huxley.*) That was 25 years ago?—Yes.

24,430. Have the trawlers been trawling ever since?—Yes; in the neighbourhood of Falmouth I have heard my father say that before the trawlers were so plentiful off the coast, as much as three tons of ling and mullet and other kinds of fish have been brought in in the course of a day; now you might as well go to a reservoir to fish as there; the ground has been completely raked by the trawlers.

The witness withdrew.

J. Kelynack.

JAMES KELYNACK called and examined.

24,431. (*Professor Huxley.*) Are you a fisherman here?—Yes.

24,432. At Penzance?—No, at Newlyn.

24,433. Have you heard what the previous witnesses have stated?—Yes.

24,434. Is there any remark that you wish to make about it?—I do not know that I have anything to say on the points with regard to which they have spoken.

24,435. Do you agree pretty generally with what they have stated?—Yes.

24,436. Then is there any matter upon which you wish to make a remark?—All I have got to say has reference to the trawlers; I have been trawling for 16 or 17 years.

24,437. Where have you been trawling?—Off our and here.

24,438. Over what part?—Off our western land.

24,439. What distance off the shore?—From three and a half leagues to seven, eight, and nine.

24,440. (*Mr. Lefevre.*) What is the size of the boat you have trawled in?—A smack of 40 tons.

24,441. (*Professor Huxley.*) What is the size of the beam?—We carry a 38-feet beam.

24,442. How do you manage your trawling, do you go out and remain out several days?—No, we are out to-day and in to-morrow.

24,443. You come into Newlyn every day?—Yes.

24,444. Do you generally carry on your trawling over the same ground?—Yes, generally.

24,445. How have you found your fishing go on during the time you have been trawling?—Tolerably well.

24,446. Has there been a pretty steady supply of fish?—Yes, in the spring time of the year, but in the summer time we cannot get much of a living by trawling in the bay.

24,447. How is that?—The fish are on the coast then.

24,448. What is the chief supply of fish you get then?—It consists principally of soles, turbot, brill, plaice, haddock, hake, ling, conger; in point of fact we get every kind of fish.

24,449. Have you ever seen any large quantity of spawn brought up in your trawl at times?—Yes, scores of tons at times.

24,450. What kind of spawn?—I cannot tell you what kind of fish it belongs to.

24,451. Was it fish spawn at all?—Yes, I have seen life in it.

24,452. And you have got up a great deal of it?—Yes, I have taken up in the trawl bushels at a haul.

24,453. Where did you get it?—Off our western land where we generally trawl.

24,454. At what time of the year?—At this time, the spring time of the year.

24,455. About April or May?—We generally get it all the year round; we begin to get it about March.

24,456. You generally take up spawn in your trawl about this time of the year?—Yes, in March, April, and May.

PENZANCE.

J. Kelynack.

31 Mar. 1864.

24,457. In what depth of water do you get it?—In from 45 to 47 and 50 fathoms.

24,458. Do you bring up great quantities of young fish as well?—Yes, we get thousands of all sorts; we get a great many of different sorts that I could mention.

24,459. Do you think that that sort of fishing is very destructive?—Yes, in my opinion the trawl net is the most destructive net that is ever thrown into salt water.

24,460. But you have not found your own fishing to fail in consequence of using it?—Yes, I have done so in the summer part of the year.

24,461. Do you think that trawling is a sort of fishing that ought to be put down?—Yes, I think it ought to be put a stop to at a certain season of the year.

24,462. What time of the year would you stop it?—I would stop it at this time of the year for two or three months.

24,463. During what months would you put it down?—During March, April, and May.

24,464. Would you have no trawling at all during March, April, and May?—No.

24,465. Then people would not be able to get many soles during that time of the year?—No, unless they went somewhere else to get them.

24,466. Then they would have to do without soles?—Yes.

24,467. And turbot?—Yes, and turbot too.

24,468. Is it a constant practice to take up this large quantity of spawn in the trawl net?—Yes, it goes on annually.

24,469. Is there anything else you wish to speak about?—No, I think there is nothing else.

24,470. (*Mr. Lefevre.*) Are there any other trawls from Newlyn?—There were three here at one time.

24,471. Have they all stopped now?—Yes.

24,472. Has your own boat gone too?—Yes.

24,473. How long ago?—About 12 months.

24,474. Was that because it did not pay?—Yes, we found it would not pay at all.

24,475. What were your three best months for trawling?—From March to May.

24,476. Then you would put a stop to trawling during the three best months of the year?—I think it is very injurious to allow it to be carried on during those months.

24,477. But if you put a stop to the trawling during those three months you would put a stop to the fishing altogether?—I would stop it.

24,478. Would not that effectually exclude the fishing altogether if you were to prohibit it during the three best months?—They are all ground-fish that they catch in the trawl, and at this time of the year they are full of roe.

24,479. Are there many trawlers that come off here now?—I have seen as many as 60 off here at a time.

24,480. Are they off here now?—A great many of them.

24,481. What distance from the shore do they fish?—From three and a half to six, seven, eight, and nine leagues; that all depends on the wind.

24,482. Do they come regularly every year at this time?—Yes, about this time.

24,483. Are they increasing in number?—There are double as many now as there were 10 or 12 years ago; there are more than double.

24,484. They do not find that it pays badly then?—Perhaps not.

24,485. Did you confine your fishing to the grounds off this part, or did you take your boat to any distance?—We confine our fishing to our own country.

24,486. And during the rest of the year, with the exception of the months you have mentioned, you do not take much fish?—No.

The witness withdrew.

EDWARD BOLITHO called and examined.

E. Bolitho.

24,487. (*Professor Huxley.*) I believe, Mr. Bolitho, that you are interested in the large seines?—Yes, I am interested in the pilchard-seining.

24,488. Can you give any opinion as to the expediency or otherwise of allowing a small seine to take a turn with a large one?—I see no objection to their taking turns with the large one provided they are furnished with nets of the proper mesh. I think a great deal of injury would be done in this bay if the meshes were not of the proper size. I did not know that there was any limit to the length of the seine, but I am not thoroughly acquainted with the subject. I know that the large seines here are about 200 fathoms long and 12 or 13 fathoms deep, but I was not aware that there was any limit as to the length. At St. Ives I know it is different, there they fish under a local Act of Parliament, and the seines are bound to be of a certain length.

24,489. Here it is custom that regulates the size of the seine?—Yes; perhaps, with regard to the drift-fishing, I may say that many years ago the boats were prohibited from fishing within three miles of the shore, and I believe a Revenue cutter had directions from the Government to protect the seine-fishermen; that I believe is not the case at present; on the contrary, the drift-boats frequently come and drift almost in the midst of the stems.

24,490. Did you ever hear of any prosecution taking place against the drift-men?—I have at St. Ives. I have been a party to one there.

24,491. Has the matter ever been fairly tried in a court of law?—I understand that it was once at Mevagissey, but I cannot speak as to the date; I believe there were one or two men sent to prison, their boat and nets were seized, and they were brought into Mevagissey.

24,492. How long is that ago?—It was about 20 years ago, and perhaps more than that; I recollect the case perfectly well.

24,493. (*Mr. Lefevre.*) I believe, Mr. Bolitho, that you export a large quantity of pilchards from Penzance?—Yes.

24,494. Do you buy largely from drift-boats?—Yes, after they are cured and ready for shipment; they are all cured and made ready for shipment by the drift-men. In this bay we export double the quantity caught by the drift-boats as compared with the seines. The drift-fishery here is of very much more importance than the seine-fishery.

24,495. Has it increased of late years?—The number of boats has increased, but I am sorry to say that on the average for the last four or five years the quantity of fish has not increased in proportion to the number of boats.

24,496. Has that been caused by the badness of the season?—Yes, I think so. The fish have not approached the shore. Our pilchard fishery is a very uncertain fishery. The fish appear to approach the shore in the early part of August, and they continue to come in at times down to the first week of November.

24,497. Do you agree with the previous witnesses who have told us that the seine fishery is bad?—I agree with them that it has been bad in Mounts Bay.

24,498. For the last 10 years?—Yes, it has been a very unprofitable pursuit in Mounts Bay during that time.

24,499. Then if it had not been for the drift-boats the fishery altogether would have fallen off and the exports would have much diminished?—Yes, that is my impression. In this bay, I think, the seine-fishing has fallen off very much for some years.

24,500. Are you interested in the seines at St. Ives?—Yes.

24,501. Do you find them more profitable there?—They take larger quantities of fish.

The witness withdrew.

PENZANCE.

Thomas Sobey called and examined.

T. Sobey.

31 Mar. 1864.

24,502. (*Professor Huxley.*) Are you a fisherman here?—Yes.

24,503. How long have you been engaged in that occupation?—I have been a fisherman here for the last 25 or 26 years.

24,504. Are you employed in the crab-fishing?—That is my chief occupation.

24,505. How has the crab-fishing been during the last 20 years?—It has not been so good as it was by far.

24,506. It has not been so good as it used to be?—It has been nothing compared to what it was in my youth.

24,547. How many people were employed in the crab-fishing when you were a boy?—I cannot say how many there were in Mounts Bay at that time, but at Penzance there were five or six little boats. There were others at the Mount and Portleven, Penberth, and other places.

24,508. Has the number increased within your recollection?—Yes, the boats out of the different coves come more than they did when I was a boy.

24,509. Do you think that the quantity of crabs has fallen off?—We fancy that they have done so of late years. We are of opinion that the crabs have fallen off a great deal, and as to the craw-fish we have had no opportunity of catching them at all in Mounts Bay, because we have been injured so much by the drift-fishing. We have been obliged to take our pots in, or else we should have had them dragged or cut away.

24,510. Do your buoys get caught by the drift-nets?—Yes.

24,511. Cannot the drift-men keep out of the way of them?—They could if they liked.

24,512. Does it not damage their nets when they get foul of your buoys?—Yes, I think it does; I have found pieces of their nets fast to our pots.

24,513. When they are out fishing in the night time how can they make out where your pots are?—They cannot make out where the pots are, but when they are drifting in the pilchard season they ought to know whether they are in the vicinity of crab-pots or not.

24,514. How far out are your crab-pots set?—In the spring of the year they are set a couple of miles from the nearest land. I have had my pots carried away in the spring mackerel season in May, and I have had them carried away when the drift-boats have been out driving for pilchards, so that we are safe at no time.

24,515. To keep you safe ought the drift-men to be kept two or three miles off the coast?—I do not wish to injure any man, but I should like to have protection for myself. I cannot get my bread in any other way; I cannot get it by hard work the same as a young man, because I have become an old man now.

24,516. Do you fish for lobsters as well as crabs?—Yes, for lobsters, crabs, and craw-fish. They come in the fall of the year when the pilchard season comes in, and we are obliged to bring our pots on shore or we should lose them. Out of 40 odd pots last year we saved only nine.

24,517. When you speak of the craw-fish, do you mean the spiny lobster?—Yes, the red lobster if you will.

24,518. You do not think you have been injured so much from the falling off of the fish as from being interfered with by the drift-nets?—No, we consider that if we could keep our pots out and make the best of our season we should do very well; but we only get three months out of the year when we can fish.

24,519. (*Mr. Lefevre.*) What are those three months?—April, May, and June; in June and July they begin to fish for pilchards.

24,520. (*Professor Huxley.*) Do you take your crabs of all sizes, big and little, or have you any regulation?—We have a regulation for crabs.

24,521. What is the smallest size you take?—I have caught them half as big as my hand, and from that to 12 and 14 pounds.

24,522. What is the smallest size you are allowed to take?—In regard to saleable fish the small ones are of no use to us, but they would crawl out through the bars of our pots.

24,523. Is there any regulation in the same way about the size of the lobsters?—Our agreement is that we sell to the merchants by a regular measure. If we catch any particularly small ones we heave them away again.

24,524. If they are very small they will get through your pots?—Yes, small lobsters and small cray-fish, and crabs too.

24,525. Is there anything else you wish to remark upon?—Not at present, except that I should like to have protection the same as other men.

24,526. You think that you are greatly injured by the drift-fishing?—Yes, I am sure of that, and the drift-men know it themselves.

The witness withdrew.

M. Wright.

Martin Wright called and examined.

24,527. (*Professor Huxley.*) Are you a fisherman at Penzance?—No, at Mousehole.

24,528. I believe there is a very extensive mackerel shery from Mousehole?—Yes, very large indeed.

24,529. And from Newlyn as well?—Yes.

24,530. How many boats are there employed in the mackerel season?—46 at Mousehole.

24,531. And how many at Newlyn?—I can hardly tell at Newlyn, but I believe there are about 76 there.

24,532. Is it all drift-fishing, or is it all hook-and-line fishing?—There are three hook-and-line boats from our place.

24,533. Not more than that?—That is all.

24,534. Then the fishing is mainly drift-fishing?—Yes.

24,535. What is the size of the mesh that you use for your nets?—We make them $22\frac{1}{2}$ to the yard.

24,536. What does the whole fitting up of one of your mackerel boats cost, including the boat, nets, rigging, and everything? What will it cost you to set up a boat?—It will cost well on towards 400*l*.

24,537. Has the number of these boats very much increased within your recollection?—Yes, very much since I can remember.

24,538. Then it is a thriving sort of trade?—Yes, since the railway has been opened. I do not know that the number of fish has increased, but the railway has made a considerable difference.

24,539. Has it raised the price of fish as well as provided a market?—Yes.

24,540. Is there an abundant market for as much fish as you can catch?—Yes.

24,541. Does it go straight to London?—It goes to London, and to different inland towns.

24,542. Do you think the supply of fish is as good as it was?—Yes.

24,543. There has been no falling off at all?—There has been no falling off in the mackerel fishery, but it fluctuates in different years; some seasons are better, and some worse.

24,544. But on the average there has been no falling off?—No.

24,545. (*Mr. Lefevre.*) Do the boats go a great distance after the mackerel?—Yes.

24,546. How far?—As much as 60 miles from the Lands End sometimes.

24,547. Westward of the Lands End?—Yes.

PENZANCE.

M. Wright.

31 Mar. 1864.

24,548. As the season advances do they come to the shore?—No, they go further off; at this time of the year they are nearest the land.

24,549. What time of the year does the season begin?—This year it began in January, but generally speaking it commences in the later part of February, and the beginning of March.

24,550. And until when does it go on?—Until the middle of June.

24,551. Are there many boats that come from a distance to follow the mackerel fishery?—Some of the Hastings boats will come down in a few weeks, perhaps two or three weeks from this.

24,552. Do they land their fish here?—Yes, all at Newlyn.

24,553. Are any of the mackerel landed at Penzance?—No, only at Newlyn and Mousehole.

24,554. Where are they sent away from by train?—From Penzance.

24,555. From Newlyn are they sent by carts to Penzance?—Yes.

24,556. Are they sold on the beach?—Yes.

24,557. Are there dealers who purchase them?—Yes.

24,558. Do the pilchard boats go westward of the Lands End?—No.

24,559. They are mostly within a few miles of the shore?—When they commence the fishery they may go ten or a dozen miles off.

24,560. But not westward of the Lands End?—No.

24,561. (*Professor Huxley.*) Would the regulation which has been referred to for keeping drift-boats three miles or a league and a half from the land at all interfere with your mackerel-fishing?—No.

24,562. You keep out further than that?—Yes.

24,563. (*Mr. Lefevre.*) I suppose that the mackerel boats are a good deal larger than the pilchard boats?—The big boats go to the pilchard-fishing as well when they return from Ireland about the middle of August.

The witness withdrew.

CHARLES CHIVERS called and examined.

C. Chivers.

24,564. (*Professor Huxley.*) Are you a fisherman here?—Yes.

24,565. What kind of fishing do you practise?—Hook-and-line fishing.

24,566. At Penzance?—Yes.

24,567. What is the season of the year for hook-and-line fishing?—All the year round when the weather will permit.

24,568. Do you go pilchard-fishing as well?—No.

24,569. Do you confine yourself altogether to the hook-and-line fishing?—Yes.

24,570. How long have you been at it?—26 or 27 years.

24,571. Do you find that you can get as much fish as you used to get?—No, not in a general way.

24,572. Has there been a falling off in all kinds of fish?—In all that I am aware of; in all the hooked fish.

24,573. Such for instance as ling and haddock?—In an odd season years ago I have taken 50 and 60 a day, and now I have been at it ever since Christmas and can only get one, two, or three a day, and sometimes none at all.

24,574. In former years was there not a great pollack fishery here at times?—So there is now in the fall of the year.

24,575. Are there as many caught now as there were in former years?—No, they used to shoot nets for them, but there is nothing of that sort now.

24,576. Do you catch turbot with the hook and line?—No; those are the long-lines that do that.

24,577. Do you fish with the hand-line or the long-line?—Both.

24,578. What will the fitting of a boat with all her lines stand you in, taking boat, lines and everything?—From 40*l.* to 50*l.*

24,579. Are there more boats employed in the hook-and-line fishing now than when you were young?—No, not so many; the old men have died away and the young ones have generally taken to the sea.

24,580. Is that because the fishing has not been so profitable?—I expect a great deal of it has been on that account.

24,581. What do you think is the reason of that falling off?—I cannot give you any account. It would seem that all up and down the Channel the fish have taken off for some years.

24,582. Is there anything else you wish to say?—When the drift-boats come across us and we have got our anchor down they do us some injury at times; the tide brings them down upon us in the night time, we cannot always see them, and we have to cut away a rope to save ourselves.

24,583. That is when you are working the long-lines?—When we are out in the Channel fishing we are sure to be in one another's way.

24,584. When you are using the hand-lines you do not anchor, do you?—Yes.

24,585. You do not drift merely?—No, we anchor five, six, or seven miles from the land in the neap tides; in the spring tides we keep in-shore.

24,586. Do you find that the drift-men run down upon you?—They can see us if they like, but they do not shun us as they ought to do.

24,587. Could they get out of your way if they liked?—Yes, we think they could.

24,588. But if they have their nets out how can they?—They cannot then. Sometimes they come across us before we are aware of it, and then we have to get out of their way as we best can; sometimes we haul up their nets and take pieces out of them; frequently we have not time to get out of their way without injury to ourselves or them.

24,589. (*Mr. Lefevre.*) How many hook-and-line boats go out in the course of the season?—Very few.

24,590. Do you do better by bringing your fish to Penzance than you did formerly?—Yes.

24,591. Do you get a better price now?—Yes.

24,592. Does that make up for the decreased supply?—No, we cannot make as much now.

24,593. You do not make as good a living now as you did?—In other days we spent more than we can get now.

24,594. How many fishermen are there in the same line as yourself?—There are only one or two; there are very few hookers in Penzance now.

The witness withdrew.

ANTHONY SULLIVAN called and examined.

A. Sullivan.

24,595. (*Professor Huxley.*) What is it that you wish to say to us?—With regard to the pilchard-fishing the last witness has been finding fault with our nets. Now our pilchard-boats do not leave their nets out for more than an hour or an hour and a half.

24,596. You are speaking of the drift-fishery?—Yes, the drift-nets are not left out for more than an hour or an hour and a half in the course of an evening, and yet they want to do away with us altogether.

24,597. Who wants to do away with you?—The crabbers and the small-line fishermen. It is not more than that at the furthest that we keep out our nets. I do not know what we should do if we were to be limited to less than that.

24,598. What do you mean by an hour or an hour and a half?—When we shoot out our nets in the evening we have them out for an hour or an hour and a half; we then draw them in, and take them to the land. If we were to stop them during that time we should have no fishing at all. Sometimes it is an hour after sundown before we shoot them.

PENZANCE.
A. Sullivan.
1 Mar. 1864.

24,599. Does not the length of time you keep them down depend upon whether you have a shoal or no?—No, sometimes we haul them in with not more than 100 pilchards in them.

24,600. Do you not drift with them the same as in the herring fishery?—No, the herring fishery is in the morning; the pilchard is an evening fish generally, and the herring a morning fish.

24,601. Do you mean to say that if you were to keep out of the way of the crabbers you would not have much chance of catching anything?—Yes, very often within two or three miles of the shore we catch a great deal more pilchards than we should by being further out.

24,602. Is there anything else you wish to say?—No, nothing. We do not wish to get foul of the pot-men, because when we do we tear our nets to pieces, and destroy them entirely.

24,603. (*The witness Adams.*) There are buoys attached to lines on the pots. The pots are obliged to be taken up in the early part of August until the middle of November. We do not allow them to put down pots where the seines can shoot.

24,603*a*. Is there any considerably fishery at the Scilly Islands?—There is a very large ling and conger fishery, but no pilchards.

24,604. How many men are there employed there?—I do not know; perhaps a score or two.

The witness withdrew, and the inquiry was adjourned until Friday, April 1st, at St. Ives.

St. Ives, Cornwall, Friday, 1st April 1864.

PRESENT:

Professor HUXLEY, F.R.S. (Chairman). | G. SHAW LEFEVRE, Esq., M.P.

ST. IVES.
J. Hain.
1 April 1864.

JOHN HAIN called and examined.

24,605. (*Professor Huxley.*) Are you connected with the fishery here, Captain Hain?—I am not connected with the drift-fishery.

24,606. With what fishery are you connected?—With the seine-fishing.

24,607. Are you an agent and merchant here?—Yes.

24,608. For the Messrs. Bolitho?—Yes.

24,609. How long have you known this port?—All my lifetime.

24,610. What is the principal mode of fishing practised here?—The pilchard fishery and the mackerel fishery.

24,611. Is the seine-fishing the principal pilchard-fishing here?—Yes.

24,612. How many seine-nets are there?—247, I think.

24,613. Two hundred and forty-seven nets?—Yes, I think that is the number.

24,614. Each net has three boats?—No, each has four boats here.

24,615. Is that the practice here?—Yes; there is one seine-boat, two tow-boats, and one volyer.

24,616. What is the length of your seine?—It averages from 160 and 170 fathoms to 200 fathoms.

24,617. What determines the length of the seine? For what reason do they make their seine-nets of that length?—We have an Act of Parliament here which requires that our seine-nets shall be over 160 fathoms long.

24,618. Why, then, do you make them longer than that?—We do that in order to catch the large shoals of fish. Sometimes the shoal is very great here, and it takes a very long seine to enclose it.

24,619. Do you think a longer seine is more convenient than a shorter one?—Yes.

24,620. But beyond a certain size would it not be inconvenient to work a seine?—Yes, it would be too heavy.

24,621. What is the size of the mesh of the seine here?—I suppose after they are tanned they will be 20 rows to the foot. They are counted 18 or 19.

24,622. How deep is the seine?—From eight fathoms to 10 fathoms.

24,623. Is there any regulation on that point?—Yes, they must not be less than six fathoms deep.

24,624. But you have not found it convenient to go as low as six?—There are none as low as six now that I know of.

24,625. Is that because it is more convenient, and because it enables you to keep in deep water so that you can surround the fish better?—We can go further off with a net 10 fathoms deep than with one of six. Ten fathoms is quite deep enough for us to go out on account of the tide.

24,626. Are your nets leaded along the bottom?—Yes.

24,627. And corked on the head-lines?—Yes.

24,628. Will you describe the mode of fishing practised here? Suppose you were going to shoot your seine, how would you go to work?—In the first place, we should have men sufficient on the hills, whom we call huers. They see the fish in the water before they come in. They frequently see them playing upon the water. When they see the fish they give a signal. The signal is made with two white bushes. Then the boat is put off from the shore, and according to the directions given by the men on the hills they make off to where the fish are. The men who make the signal have the sole management of the direction in which the boats are to go; they always control them.

24,629. Have the boats taken their turns before this takes place?—Yes.

24,630. Each boat then before this must be in its turn?—Yes, they must have taken their stems and been registered.

24,631. Then suppose you get to the shoal of fish, what takes place then?—They shoot their net round it. They have two boats, a stop boat and a tow boat. The seine net is taken by one boat in one direction, and the tow boats go in another until they meet.

24,632. Do they pay out the net from the seine boat?—Yes.

24,633. Are both boats loaded with nets?—Yes.

24,634. Is the middle of the net between the two boats?—We fasten both together when we commence to shoot.

24,635. And you pay out from the middle part?—Yes, from both boats, and surround the fish.

24,636. Do they bring the two ends together?—Yes.

24,637. And you make them fast together?—Yes, we make them fast together. The net hangs perpendicularly in the water, and when we put them in we attach them together.

24,638. Do you tow the net when you have made it fast round the fish into shallow water?—Yes; out of the tide.

24,639. Then you are obliged to tow it into the stem?—Not always; after the seine is shot, and the fish in the seine, it does not matter in what stem the fish go then.

24,640. Do you take the stem before you enclose the fish?—Yes.

24,641. If the fish drift away in a particular direction before you have completely shot round them, have you a right to go into another stem?—If we are certain that the fish are there we can then follow them.

24,642. How are the fish got out of the net?—We have got what we call a tuck net.

24,643. How large is that?—About 70 fathoms long and about 10 fathoms deep.

24,644. Has it any pocket in it?—It has not a pocket but it has a great deal of slack twine. There is room for the fish to go into a bag which is almost equal to a pocket.

24,645. Are the fish taken out of that?—Yes, by baskets, and then they are put in the boats.

24,646. Are there salting-cellars here?—Yes, a great number of them.

24,647. How many are there in this place?—I can hardly tell.

24,648. Is that because there are so many?—There are more than 100 I suppose, nearly every fisherman has one of his own.

24,649. Then the salting-cellars do not belong to merchants here?—Yes; the merchants have salting-cellars as well as the seiners.

24,650. Has not every seiner a sufficient amount of salting accommodation to enable him to salt the fish that are caught in the seine?—Yes, unless he gets what we call above an average season.

24,651. Are the salting-cellars that belong to the fishermen used for the seine-fish?—No; the fishermen who belong to the seine get one-ninth part of the catch, and they put that in their own salting-cellars.

24,652. Do they get one-ninth part of the fish in lieu of wages?—They are paid partly in wages and partly by a share of the fish.

24,653. How many men are required to manage each seine?—They go eight men in the seine boat, six in each tow-boat, and two in the volyer.

24,654. What do you call a tow boat?—She carries the stop seine.

24,655. Then altogether how many men are there?—Generally 22.

24,656. That is more than they have on the south coast?—Yes; they have from 12 to 16 men in charge of each seine-net on the south coast.

24,657. But you have 22 men here?—Yes, sometimes we have six less.

24,658. Are the majority of them sailors?—They are all fishermen and sailors.

24,659. Are they all fishermen who live by nothing else but fishing?—Yes, generally.

24,660. You do not employ agricultural labourers here?—No, not in our boats. We may sometimes employ a man who has not been in the habit of fishing all his life, but who can row an oar very well.

24,661. The crew generally are all fishermen who depend on fishing for a living?—Yes.

24,662. How are they engaged?—They commence now about this time in the mackerel-fishing. They go on with that from this time or until the middle part of June. Then they go chiefly on the Irish coast to fish for herrings. They come back in August and then they go with the seine-nets. Some of them are employed in line-fishing.

24,663. Do the seine owners make an agreement with the fishermen?—They make it each year before the fishing commences.

24,664. What is the arrangement?—The men are to have one-ninth part of the fish and 45*s.* wages per month.

24,665. Do you engage the full crews of all your boats for the season?—No, these 22 men would take eight seines. They take their turns as they come round the stem.

24,666. How many seines does a seine owner commonly own?—Some are owned by companies. Some will have eight, some 10, and so on; the number differs in different cases.

24,667. Does each seine owner commonly have a sufficient number of seines to employ a crew for himself?—Yes.

24,668. How do they make an arrangement with the men?—It is made in the beginning of the season.

24,669. Do they promise to give 45*s.* wages per month as long as the season lasts and one-ninth part of the fish?—Yes.

24,670. (*Mr. Lefevre.*) Are the fish divided at once when they are taken?—Yes, they are divided at once on the beach.

24,671. (*Professor Huxley.*) Then of course their profits depend very much indeed upon the take?—Yes.

24,672. They get nothing at all besides their wages if they get no take?—No.

24,673. Are they bound during the whole time of the pilchard-fishing to remain here, and be at the call of the seine owners?—Yes, they are bound to be every day on the water when the stems are in hand.

24,674. Cannot they take any other occupation during the time?—No, but sometimes they are enabled to go away at night during the mackerel season.

24,675. Your seine-fishing takes place during the day?—Yes.

24,676. How long does the pilchard-fishing last?—From the commencement of August to the commencement of December.

24,677. It all depends upon the time the fish come in and the length of time they remain?—Yes.

24,678. You have no fixed duration for fishing of any kind?—No, but it generally lasts about three and a half months, and sometimes four.

24,679. And as long as the season lasts you are bound to give the men 45*s.* a month?—Yes.

24,680. And, upon the other hand, they are bound to be ready for your work?—Yes.

24,681. How much does a seine-net cost complete, boat and all?—About 300*l.*, or rather more than that.

24,682. More than that?—Perhaps a little more, if you take stop-nets and all.

24,683. I take everything that is required for the seining operation?—It would depend very much on the size of the concern and the size of the nets. Some months ago a seining concern was sold here, consisting of ten nets and everything required, for 2,000*l.*

24,684. That would be about 200*l.* a seine?—Yes, but it would take more than that to buy them now.

24,685. Do you think then that 200*l.* is a fair price for each seine-net?—It will take more than that to start a new concern.

24,686. What would it cost to start them now?—From 250*l.* to nearly 300*l.* a seine. To take ten seines, and have everything requisite for a concern of that character, it would cost 300*l.* a seine.

24,687. Does that include the cost of the boat?—Yes, the cost of the boats also.

24,688. Do the seines cost much to keep them up?—Not a great deal; they are shot very seldom.

24,689. How many times in the course of the season do you expect to shoot a seine?—Sometimes a seine is not shot at all. Some may shoot two or three times in a season, and sometimes none. It depends altogether upon the fish.

24,690. How many shoots will be a fair average for the season?—It does not depend upon the season how many times a seine would be shot.

24,691. How do you manage about arranging the stems?—We have an Act of Parliament to regulate that.

24,692. Have you got the coast here divided into stems?—Yes.

24,693. How are they taken?—They are taken when we first put our seines in the sea. Every stem is registered. We have a register belonging to each concern. Every seine pays its money and is registered for the season. If a seiner goes down to Carrack Gledden with five men, and takes his warp on shore, that constitutes stemming.

24,694. (*Mr. Lefevre.*) Does he start from here?—Yes, from the pier.

ST. IVES.

J. Hain.

1 April 1864.

24,695. May any man row out and take any stem he likes?—If there is no one there he may.

24,696. How is the order of succession for taking stems arranged?—That is arranged before we commence the season.

24,697. What is the arrangement?—It is arranged according to the number each person has.

24,698. According to the number of seines?—Yes.

24,699. Does the man with the greatest number of seines take the first turn?—He takes the greatest turn, that is, the largest proportion of turns.

24,700. What I want to understand is this: suppose I want to take a turn, and somebody comes after me, and has a right to take it after me, how does he get that right?—He gets it in the same way that you have got yours.

24,701. By pulling into the stem?—Yes, and throwing his warp ashore.

24,702. He gets the turn the day after?—Yes.

24,703. Then his succeeding does not depend on any arrangement made at the beginning of the fishing?—Yes, it does.

24,704. It is rather difficult to comprehend the nature of this arrangement?—There is a gentleman present who will be able to explain that matter better to you than I can.

The witness withdrew.

W. Roberts.

William Roberts called and examined.

24,705. (*Professor Huxley.*) Can you explain this matter to us? — There are 247 seines, and, of course, with such a large number there must be a private arrangement. The Act of Parliament is the basis of our arrangement. That describes how a seine is to become qualified for taking a stem. The boat must have a sufficient quantity of warp and material of different sorts. Before we proceed at all at the commencement of the season all the representatives of the owners meet, and arrange a list based on the number of seines. Last year, with 247 seines, we were all united into five companies. The smallest company had 42, another 46, another 48, and another 62. We had to make an arrangement to give to each of the associated companies a proper proportion of stems. There are five or six stems, I believe. When we have agreed to that (and there is sometimes some little difficulty in coming to an agreement), that forms the basis of the arrangement for the year. So that you or I know, if we have a certain number of seines, exactly how many stems we have in which to take our turns.

24,706. Do you arrange a sort of roster, so that A takes first turn, B then, and C follows?—We take them in regular order, and very frequently we have 15 or 16 boats keeping their turns or stem. They are all qualified to take their turn, but can only take one turn per day or per tide.

24,707. Must they succeed each other in the regular order fixed before the season begins?—Yes.

24,708. (*Mr. Lefevre.*) Does that regulate the first turn on each day?—Yes, and if a boat shoots the next in turn will be entitled to take the turn on that day. If it do not shoot, then the next in turn is only entitled to take it next day.

24,709. (*Professor Huxley.*) The next in turn has his turn by virtue of this arrangement?—Yes.

24,710. So that there is a kind of roster?—Yes.

24,711. How long does each stem last?—The stem lasts for 24 hours.

24,712. (*Mr. Lefevre.*) If the first does not shoot during the day the next man gets his turn on the day following?—Yes.

24,713. And the one who has shot is last on the list for his next turn?—Yes.

24,714. (*Professor Huxley.*) The difficulty in understanding this arrangement arose from the circumstance that, in other places, it has been suggested that there was always a kind of racing in order to get first turn. I imagine that that must occasion great confusion?—That would not do for us at all.

24,715. (*Mr. Lefevre.*) Did I apprehend you correctly that the slightest confusion would put the whole of your fishing into a bad condition?—Yes. Now and then, when there are new persons coming in to work the seines, a little bit of jealousy springs up, and there is some difficulty in making a private arrangement. It would be impossible, however, to carry out the business properly with so large a number of seines, if there were not some fixed arrangement. They have all now consented to be associated in companies, and to the offering of a premium to some one to make out the list. It is done by some one who takes a little time in giving to each its proper proportion of turns.

24,716. Then the Act of Parliament has been modified to some extent with respect to taking turns?—We stick to the Act still, and we only arrange the order in which the turns should be taken. We assume that each seine is legally qualified to take a turn.

24,717. I understand from you that the boat is bound to be there on the spot, with the warp and five men?—Yes, if that were not so she would disqualify herself.

24,718. She would disqualify herself if she were not there?—Yes, or if she were there in an illegal position; for instance, if she had only four men. If I saw your boat there with only four men, and I had the next turn, I could send out my men legally qualified, and could go and take your turn.

24,719–20. Then there is to be a boat there to entitle the seine to take its turn?—Yes.

24,721. And that is the case with the boat that is to take its turn after that?—It is quite a matter of private arrangement after that. If you have the second turn, and thought that you had any chance of being able to shoot, in consequence of the first one shooting away his turn, you would send your men and boat to be in readiness in case such a thing occurred.

24,722. But if you are second on the list, and do not send your boat, are you able to take the turn on the following day first?—Yes, and your going second to-day would not disqualify you from taking the first turn to-morrow, unless you get a shoot.

24,723. (*Professor Huxley.*) Does the Act of Parliament give you a right to make byelaws?—Yes.

24,724. Do you consider that these regulations are in the nature of byelaws?—No.

24,725. Do you make that arrangement every season?—Yes, before the season commences.

24,726. Do you consider it a private arrangement, having nothing to do with the powers given to you under the Act?—Yes, we regard it entirely as a private arrangement. I am not aware that we have made any byelaws under the Act at all.

24,727. There is a clause in the Act which gives you power to do so?—Yes, but we have not made any. These are regulations which come within the character of byelaws, but they have never been registered as byelaws. We have always gone on the principle that the arrangement we make in this respect is sufficient for the time being. We should hardly like to bind ourselves for another year. The whole circumstances might be changed in another year, or the people might come in with a larger number of seines.

24,728–9. (*Mr. Lefevre.*) Or any person might come in with only one seine and break up the arrangement?—Yes.

24,730. (*Professor Huxley.*) Do you think the Act here has been beneficial to you?—I think so. It would be almost impossible to go on without such an Act.

24,731. The regulations of the Act are exceedingly minute?—Yes; now and then we find that they squeeze some of our toes, and we are inclined to wish that such and such a clause had not been there. Probably the next day we should alter our opinion and feel glad that it was there.

24,732. Are all these regulations as to the size of the rope and with regard to minor details matters absolutely necessary to be regulated by law? Would not each man's interest dictate what was best for him?—We fancy it is not as necessary now that there should be regulations. Our fishing property here has been materially improved within the last 20 years. I can quite conceive that when the Act passed such regulations were absolutely necessary. The nets were then very old and of an inferior description, and boats were admitted to be used in the fishing which were not fit for the business; therefore, as you may easily imagine, circumstances made it necessary at that time that regulations should be imposed, whereas now, as Captain Hain has justly observed, we are all in a better position. Even then the minimum length of the nets and their depth were provided by the Act. All the nets used here now are both longer and deeper.

24,733. Do you find that these minute regulations act as restrictions in preventing you from improving your fishing gear?—No; the Act simply says that we shall not go lower than a certain length and depth, which means that a seine less than 6 fathoms deep and 160 fathoms long, which would not be efficient, and which would militate against the public weal if an attempt were made to take fish with such a net, shall be considered illegal and not entitled to a turn.

24,734. Then on the whole do you consider that the operation of the Act has been beneficial?—Yes.

24,735. (*Mr. Lefevre.*) How did you regulate the fishery before the Act came into operation?—I have scarcely any knowledge of that. My knowledge of St. Ives is confined to the last 30 years. The Act passed about 28 years ago I believe.

24,736. The Act passed in 1841, 23 years ago?—Yes, it was somewhere about that time.

24,737. You spoke of nets inferior in quality, do you mean in size?—In size, in length, and in the quality of the material.

24,738. Such inferior nets existed at the time of the passing of the Act?—Yes; we were not bound then to shoot the seine. The boat must hold the seine, and when the time came round the seine was to be put in, but now we are obliged to shoot the seine.

24,739. Were there many nets of inferior size at that time?—Yes, I believe there were.

24,740. Were they prohibited from being used by the Act?—They were prohibited if they were not of the proper length.

24,741. (*Professor Huxley.*) There is a regulation here that no mode of fishing other than the seine-fishing shall be carried on within a distance of 1,000 fathoms from the shore while the seine-fishing is going on?—Yes.

24,742. Do you think that the distance of 1,000 fathoms is sufficient to prevent every kind of disturbance to the seine-fishing?—I believe so; I never heard the distance complained of. There have been contests occasionally with persons who have trenched within the limits.

24,743. Is the object of the regulations to prevent you from being seriously interfered with, by the drift-fishermen, for example, or any other mode of fishing?—I think so; but my impression is that the drift-net fishermen cannot drive until after sundown anywhere. I am not quite sure that that is so, but I think it is.

24,744. Then the drift-men here do not interfere with you at all, because you seine here in the daytime and they drift during the night?—The only interference on their part would be by their fishing when our seines are in.

24,745. Have you any reason to believe that the operations of the drift-fishermen on this coast interfere with the seine fishery by breaking up the shoals or dispersing them?—They would undoubtedly if they used the drift-nets by day.

24,746. But do they interfere in that way by drifting at night?—No, we think not.

24,747. Then they do not interfere with you?—I think not. Our shoals come generally in large bodies. Our fish principally come in the month of October, and the drift-nets would be a very small obstruction to them.

24,748. Is there a large body of drift-fishermen here?—There are about 60 or 70 boats.

24,749. All drift off the coast in the season?—Their principal employment is in the mackerel-fishing.

24,750. But they do use the nets in drifting for pilchards during the season?—Yes.

24,751. And are they drifting at the same time that you are seining?—Yes.

24,752. But you never thought that you had reason to complain of them for interfering with the seine-fishing?—No, except when they go down with their nets before sundown.

24,753. So long as they fish at night they do not interfere with you?—No.

24,754. (*Mr. Lefevre.*) Have there been any prosecutions under the provisions of the Act?—I think there have been one or two instances where fishermen have been brought before the magistrates.

24,755. Have the Custom House authorities or the Preventive men the power of enforcing the provisions of the Act?—We have the power ourselves. We have an officer called the registrar whose duty it is to prosecute. Now and then there is a little bit of jealousy with regard to the fishing of the drift-net men. We sometimes think that they trench upon our fishing by going off with the drift-nets before sunset. We think that they interfere with us and we have threatened to prosecute, but it generally ends there. There have been only one or two prosecutions.

24,756. Are the provisions of the Act with regard to the registration of turns adhered to?—Yes, strictly.

24,757. What is the convenience of that?—It prevents those from coming who have not the proper materials for catching a shoal of fish. It obliges them to be in a position in which they may fairly expect to enclose a shoal. If a man were to go down with a net inferior in depth or in length, or with a smaller number of men than is necessary to manage it, he would simply destroy the chance which an efficient person with proper nets would have of taking the fish, without being able to take them himself.

24,758. Then the registrar would refuse to register a man for a turn unless he was properly equipped?—Precisely.

24,759. And if he were not registered another person would be entitled to keep his turn in his place? Yes.

24,760. (*Professor Huxley.*) Is it commonly the case that after a properly qualified net has been shot once in a turn, and has enclosed all the fish it could, that a second net has been enabled to come and enclose a second shoal of fish in the same place?—Yes.

24,761. And even a third net?—Yes, and a fourth and a fifth, and even a tenth.

24,762. Then I take it that the operation of shooting the net does not disperse the fish?—No, I have seen as many as 40,000 hogsheads of fish in the bay at one time. The utmost ever saved was 5,500 hogsheads in one shoal. That, however, was an extreme case.

24,763. You do not disturb the fish, and you can come again?—Yes, the fish are continually moving.

24,764. Do they move fast?—Pretty fast.

24,765. How many knots an hour would they go?—Perhaps three or four, or perhaps not more than one and a-half miles in an hour. I can hardly tell, they are constantly moving along.

24,766. (*Mr. Lefevre.*) What is the length of the stations here?—I do not know, I have never measured them. They are all laid down, however.

ST. IVES.

W. Roberts.

1 April 1864.

24,767. What extent of ground will the six stations here cover?—I can hardly say, because one station will take the whole of three stems at low water. It depends on the state of the tide. The turns are of different extent at different states of the tide. They are of one extent at high water, of another at an intermediate state of the tide, and another at low water. All these things, however, have been regulated by the experience of the fishermen in days gone by. I believe there was an Act of Parliament in existence before the Act of 1841, but it was repealed by that Act. As I understood the Act of 1841 it was mainly directed towards getting the property into a more efficient state. It had been allowed to go down very much before that Act was passed.

24,768. With regard to the provision preventing drift-net fishing within 1,000 fathoms of the stems, I want to know what amount of ground that cuts off from the fishermen?—Our fishery extends, that is to say, the stems extend, from the back of our bar down to the foot of Hayle Bay; that would be about three miles.

24,769. Then the six stems are included within these three miles?—Yes, and any drift-net fishing within 1,000 fathoms is illegal.

24,770. How do you measure the distance?—From the shore.

24,771. Not from line to line drawn between the points?—I have never tested the matter so closely as that.

24,772. That would make a very great difference, would it not?—Yes; when we go down to Carrack we have six pieces of warp in a boat, 120 fathoms each, that is the furthest we go. I daresay the regulation of 1,000 fathoms resulted from a knowledge of that.

24,773. (*Professor Huxley.*) Can you give us any idea of the amount of capital invested in the seine-fishing here?—I agree with Captain Hain's statement that the cost of a seine would be about 250*l.*, and there are 247 seines. New seines would cost perhaps 300*l.*, but the other day a company sold a number at the rate of 200*l.* per seine.

24,774. (*Mr. Lefevre.*) Is there any variation in the depth of the seine?—A little; some are not more than seven fathoms, and some are about 10½ fathoms.

24,775. Then six fathoms is the minimum?—Yes.

24,776. Would it be a great inconvenience to the fishing if seines of a smaller depth were used?—The water would be too deep for the seines to touch the bottom, or the fish would get out under the net, and it would be of no use attempting to catch them.

24,777. (*Professor Huxley*) Is there anything else that occurs to you which you would like to state?—No.

The witness withdrew.

Capt. Hain.

Captain Hain recalled and examined.

24,778. (*Professor Huxley.*) You were saying that you have known the fishery here for a great number of years?—Yes.

24,779. Has there been a great variation in the seine-fishing within your knowledge?—Some years we had none.

24,780. Some years you have had more?—Yes; and in some years we have had very great catches.

24,781. Do you recollect whether it has been bad in any particular season?—Yes; it is just within my remembrance that for seven years there were hardly any fish.

24,782. How long ago is that?—The fish came in 1822; for seven years before that there had been none caught.

24,783. Was it not the same on the south coast?—Yes, I think so.

24,784. Since then how have matters gone on?—In some years we have had none, in some we have had moderate catches, and in others we have had very great catches.

24,785. When there were no fish caught here, was it because there were no fish on the coast?—I think so.

24,786. Have you any distinct recollection of what occurred so far back?—No; I know that the drift-boats used to be drifting for herrings, and that they came in winter after winter without any pilchards. If there had been any pilchards they would have caught them.

24,787. Does it often happen that the seines get none and the drift-boats do?—Yes; sometimes the drift-boats catch fish when the seines do not.

24,788. Do the drift-boats often get a large supply when there are very few or none at all taken by the seine-nets?—No, not a large supply.

24,789. Generally the drift-nets and the seines go pretty much together?—Yes; I can hardly remember a cargo having been taken by the drift-boats without some having been taken by the seines.

24,790. Is the supply obtained by the drift-boats more steady than that obtained by the seines?—Very little, in the summer perhaps it may be. In the latter part of July they are able to take them five or six leagues off in the offing.

24,791. Do they not bring in their fish every day pretty regularly by the drift-boats?—Yes.

24,792. How long does that go on?—It goes on for some months, but not regularly, some months they get none.

24,793. That is by the drift?—Yes, by the drift.

24,794. How many drift-boats are there employed here?—I think there are about 67 in the mackerel fishery.

24,795. Are the same boats employed in pilchard-drifting?—Some of them.

24,796. Not the whole?—No; some smaller ones take the place of the mackerel boats.

24,797. How many are there employed altogether in the drift-pilchard fishery?—Somewhere about 50; sometimes not more than 20. The average employed in the drift fishery varies very much.

24,798. Are there sometimes very few?—Yes.

24,799. How is that, does it not pay?—No.

24,800. How long will a fleet of pilchard-nets be?—They carry what we call 15 nets, each net will be about 75 or 80 yards.

24,801. What is the size of the mesh?—The fishermen generally use the old herring nets for catching pilchards.

24,802. Shrunk herring-nets?—Yes.

24,803. How many meshes to the yard?—When they are first made they are 33 meshes to the yard, but they come down to 24.

24,804. Will the old herring-nets do to catch pilchards with?—Yes.

24,805. How far will the mesh have shrunk down? To 12 rows to the foot.

24,806. What is the size of the mesh they use for catching herrings?—32 or 33.

24,807. Is not that rather a large mesh?—They are 32 or 33 when they are made, the tanning shrinks them. Some have 32, but in general 33 is preferred as the best mesh.

24,808. What time of the year are the pilchards full here?—We never see them full; at the time we take them they have no roe in them at all.

24,809. What time of the year do you think they are full?—In February or March, to the best of my belief.

24,810. Early in the year?—Yes, I think so, but I am not clear on the point.

24,811. At the time you take them they are never full, are they?—They never have any roe in them at the time we take them.

24,812. The next great fishing you have here is the mackerel-fishing?—Yes.

24,813. How many mackerel-boats are there here?—67, I think.

24,814. Sixty-seven ?—I think so.

24,815. They are almost all decked boats, are they not?—Yes, partly decked, not entirely decked.

24,816. Is there a large space for a main hatch in the middle ?—Yes, they are hatched over.

24,817. Where is the chief fishing ground?—Somewhere about seven or eight or nine or 10 leagues from this place, north, north-north-west, and north-north-east.

24,818. They go occasionally to the Irish coast ?—Yes, for herrings.

24,819. Not for mackerel ?—No, they have not been for mackerel for many years.

24,820. What is the tonnage of the mackerel-boats? —I think from 12 to 18 tons.

24,821. Twelve to 18 tons ?—Yes.

24,822. What is the size of the mesh of your nets ? —When they are new somewhere about $8\frac{1}{3}$, some of them are 8.

24,823. Eight to the foot —Yes, but it depends on the size of the twine.

24,824. Of course you are measuring now from knot to knot ?—Yes $8\frac{1}{3}$ is about the size.

24,825. How long will a fleet of nets be ?—About a mile and a quarter.

24,826. Are they made in the same fashion as herring-nets ?—No, they are shoaler. The herring-nets are 15 score meshes deep, the mackerel-nets only six.

24,827. Six score meshes ?—Yes.

24,828. Then the mesh being larger they would be deeper ?—No, they are not equal in depth.

24,829–30. But they are buoyed in the same way ? —No, the floats are put on the rope. The rope swims on the surface of the water ; that is on account of the mackerel always swimming high, they are not like the herrings.

24,831. What will a mackerel-boat with all its fittings cost ?—Nets and all.

24,832. Yes, everything ready for sea ?—We generally calculate that a good boat will cost 250*l.*

24,833. What will the fleet of nets cost ?—Each net will cost about 2*l.* or 2*l.* 5*s.*

24,834. That would be about 200*l.* ?—They average that or more.

24,835. About 300*l.* perhaps ?—Yes.

24,836. How many men are there in the crew of a boat ?—They average six, some of them have seven.

24,837. Do they go out and come in again every day ?—When they can fish and have good weather they do.

24,838. Has the number of boats increased much within your recollection ?—Yes

24,839. How many were there when you first knew the place ?—I can remember when there were only 17.

24,840. There are four times that number now ?— Yes, four times the number.

24,841. Has the yield of fish been pretty good — Some years it has been good and sometimes slack.

24,842. On the whole how has it been ?—On the whole it has been good.

24,843. Do the boats belong to the fishermen here ?—Yes.

24,844. Not to the seine owners ?—No.

24,845. Do any of them belong to the tradesmen of the town ?—Only very few out of the 60.

24,846. Are they mainly built and paid for by the fishermen here out of their own savings ?—Generally.

24,847. Then there has been some money made out of the mackerel ?—Yes, some.

24,848. Is there any hook-and-line fishing here ? —Yes.

24,849. Is there much of it ?—Not a great deal.

24,850. Do the same boats go mackerel-fishing ?— They catch some with the hook and line when they are mackerel-fishing. They use the hook and line at the same time as they are riding their nets.

24,851. They use the hook and line on such occasions ?—Yes.

24,852. Large fish, such as cod and ling, they take ?—Yes.

24,853. Is that with the hand-line ?—Yes.

24,854. Is there any long-line fishing here ?—Yes, with what we call the bulter.

24,855. During the mackerel season do the great mass of the fishermen go mackerel-fishing ?—Yes, nearly the whole.

24,856. Has the yield of hook-fish remained about the same, or has it fallen off or increased of late years ?—I suppose there has been more search after them, and there have been more taken ashore because there have been more men engaged at that employment. Perhaps this last winter there was a falling off.

24,857. How has the supply of whiting been here ? —It has been very slight, indeed it has almost fallen off altogether.

24,858. How has the supply of conger been ?— Pretty good in the summer.

24,859. And hake ?—We get some here.

24,860. Has the supply fallen off ?—I think it has.

24,861. Is there any trawling here ?—A little in the bay in the winter.

24,862. Are there any regular trawlers here ?— No, there is no regular trawler. The same boats go fishing for mackerel and herring, and in the winter season go trawling.

24,863. What is the size of the beam they use ?— It is quite a small trawl, with a beam of not more than 35 or 36 feet.

24,864. (*Mr. Lefevre.*) Do the Brixham trawlers come here ?—No, they cannot trawl in our offing.

24,865. Is the ground rough ?—Yes.

24,866. (*Professor Huxley.*) Then they cannot trawl in the bay ?—No.

24,867. When does herring-fishing commence here ? —In the middle of October.

24,868. How long does it last ?—Sometimes till Christmas.

24,869. What condition are the fish in ?—They are full at the latter part of the season, but our herrings have fallen off during the last 20 years.

24,870. How many nets are there now ?—About the same there always were.

24,871. Do you ever see full fish here in February? —No.

24,872–3. Do you ever see herrings here in February ?—No.

24,874. Are the herrings abundant here ?—They have not been abundant here during the last 30 years.

24,875. Were they abundant here in former years ? —Yes.

24,876. What becomes of the herrings when they are caught ?—They are salted generally, and some of them are carted away and sold fresh They are carried to Wales and Ireland.

24,877. Are there any curing houses here ?—No.

24,878. Used there to be ?—There used to be one, but it is gone now.

24,879. Have you any ground-seines in the bay here ?—A few.

24,880. Have you any great number ?—No, not any great number, perhaps half a score.

24,881. What time of the year are they used ?— At any time, they are not particular.

24,882. What sort of fish do you get in them ?— All sorts of fish.

24,883. Soles ?—No, not many soles ; they are used in the herring season, and in the fall of the year.

24,884. What is the principal kind of fish they catch ?—They catch the herrings.

24,885. They use them for herrings ?—Yes.

24,886. Do they haul them ashore ?—Yes.

24,887. When the herrings come in-shore ?—Yes, when they come in-shore, or pilchards, or anything else.

24,888. Do you think that by the use of these seines a great quantity of small fish is destroyed ?— I think so.

ST. IVES.

Capt. Hain.

1 April 1864.

24,889. Have you seen that yourself?—Yes.

24,890. You have seen large quantities of small fish brought up?—Yes, and left behind on the beach dead.

24,891. Have you ever seen large quantities of small fish of that kind sold for manure here?—No, not for manure.

24,892. Is there any complaint of the damage done to the fishery by this practice?—I have heard it complained of by some of the fishermen that they kill the spawn.

24,893. Is there any complaint made here with regard to the operations of the trawlers?—I have heard the same complaint made with regard to the trawlers.

24,894. That they destroy the spawn?—Yes, that they hurt the spawn, and that they kill fish not fit to be killed.

24,895. Has ground-seining been practised here ever since you have known the place?—It has been to some extent, but not so much as now.

24,896. Do you think that damage has been done to the fish in consequence?—Yes, to flat-fish, whiting and so on, but I do not think that they do much damage to the pilchards.

24,897. (*Mr. Lefevre.*) What is the whole number of men regularly employed in seining here?—About 220 or 230 men.

24,898. Are they in the receipt of regular wages?—The fishermen have regular wages.

24,899. And besides them you have a number of landsmen?—We employ men we call blowsers, who get no wages, but are paid so much per hogshead.

24,900. Do any of the fishermen hold shares in the seine-nets?—No, I think not, scarcely any of them.

24,901. I suppose the ownership of the seines and the working of them is rather a risky trade?—Yes.

24,902. Does it occasionally happen that a seine does not get any turn?—Yes, sometimes one will not get any fish, while others will.

24,903. Then there is a great deal of chance about it?—Yes, it is all chance.

24,904. Are there any seines eastward of Hayle?—There are two at a place called St. Agnes, and six or seven at a place called Newquay.

24,905. Do you know the number of fishermen employed there?—No.

24,906. Are there any westward of St. Ives?—There are one or two at Gurnard's Head, and one down at Sennen.

24,907. Are the fish exported from St. Ives?—Yes.

24,908. Where do they go to?—To Naples, Civita Vecchia, Genoa, Leghorn, and other places.

24,909. Is the export trade in the hands of a few merchants?—Yes.

24,910. Do they have a brand of their own?—Everyone puts his own name upon the casks.

24,911. There is no Government brand then?—No; at St. Ives everyone puts on his own name and the date.

24,912. Do the fish generally run of the same size?—Some of the shoals are very large and some are only small.

24,913. But do the fish themselves run of the same size?—No; sometimes the barrel will hold nearly 3,000, and sometimes not more than 1,000 or 2,000.

24,914. Do you find in the same shoal a considerable number of small fish as well as large?—Not often; sometimes we find a few small ones, but in a large shoal of fish the fish are generally largest.

24,915. (*Professor Huxley.*) Has any proposition ever been made within your recollection by anybody engaged in the seining and exportation of fish to have a Government brand or a Government mark placed on the fish, or any Government inspection?—Not that I am aware of.

24,916. No one has ever desired that?—No; there was a time when there was a bounty on the fish, and then there used to be a Government mark; since the bounty was taken off all that has ceased.

24,917. Did the fish get a better or a worse market after the Government mark was taken off?—No.

24,918. Was there no difference made when the bounty was taken off?—Not that I know of.

24,919. Is the curing of the fish a delicate process?—No, they are salted in the bulk. First a layer of fish and then a layer of salt. They are dry-salted.

24,920. Do the fish differ much in quality from different curers?—Sometimes they do a little.

24,921. But not a very great deal?—No.

24,922. There is no smoking of the fish?—No.

24,923. They are entirely cured by layers of salt?—Yes.

24,924. Is there any remarkable difference abroad in the estimation in which the fish of different merchants is held; is the fish sent by one merchant preferred to that exported by another?—I think not.

24,925. There is no great difference in the quality?—No.

24,926. (*Mr. Lefevre.*) Had the taking off of the bounty an injurious effect upon the fishing here?—There was only a loss of the money, that was all I know of.

24,927. There was no falling off of the fishery in consequence?—Not in the least.

The witness withdrew.

W. Rouse.

WILLIAM ROUSE called and examined.

24,928. (*Professor Huxley.*) Are you a fisherman here?—Yes.

24,929. How many years have you been fishing here?—About 30 years.

24,930-1. Have you been drift-fishing all that time?—Yes.

24,932. Have you been at all engaged in the seine-fishing?—Yes.

24,933. And in hooking as well?—Yes, in hooking also.

24,934-5. Have you also been engaged in the mackerel-fishing?—Yes.

24,936. Have you heard what has been stated by Captain Hain?—Yes.

24,937. Is there anything that occurs to you to remark upon; have you heard anything stated upon which you wish to say anything?—Yes, I should like to say something about the drawing-seines.

24,938. Are those the seines which have been called ground-seines?—Yes.

24,939. What do you wish to say with regard to them?—I think they do a great deal of injury.

24,940. How do they do injury?—They kill the spawn.

24,941. Have you seen them used?—Yes, I have been using them.

24,942. Have you noticed that they do bring up spawn?—Yes, spawn that is not saleable or good for any person.

24,943. By spawn you mean small fish?—Yes.

24,944. Do they bring up a great quantity of small fish?—Yes.

24,945. Of what sort?—Flat-fish.

24,946. Plaice?—Yes.

24,947. Soles?—Yes.

24,948. Turbot?—Yes, very small turbot.

24,949. How small have you seen those fish?—I have seen some of them not bigger than half a crown.

24,950. No market could be got for fish of that description?—No.

24,951. Then you think that that is a waste?—Yes.

24,952. What is the proportion of large saleable fish that you get?—We get them of different sizes, but when we get them of that small size they are not saleable, nor are they fit to eat.

ST. IVES.

W. Rouse.

1 April 1864.

24,953. Is there a large proportion of that unsaleable fish in proportion to the quantity of good fish taken?—They get more small fish than large.

24,954. I suppose you think that is very wasteful?—Yes.

24,955. Have you been drift-fishing?—Yes.

24,956. Are you in the habit of drift-fishing?—Yes, all the year round.

24,957. Do you drive for pilchards?—Yes.

24,958. Would you feel it any hardship if you were kept 1000 fathoms outside the stems, or would it be a matter of any consequence to you?—No, we manage our fishing in the night and not in the day.

24,959. Then it would not make much difference?—No, if they let us have the night.

24,960. You do not feel it any grievance?—No, if they let me have the night to drift where I like, but I should not be bound to keep outside for 1000 fathoms in the night time; very often I could get a good night's work within that distance when if I were obliged to go further off I should get nothing.

24,961. Do you feel you are prohibited, as the law now stands, from going in within 1000 fathoms in the night time?—I am told that I must not do that; the Act of Parliament tells me that I shall not come within 1000 fathoms.

24,962. Have you acted upon that; have you always kept outside for 1000 fathoms?—I have been afraid to go in the drift-fishery, although many times we might have done much better by going in.

24,963. (*Mr. Lefevre.*) Do you think that a good many of the fishermen do set their nets within 1000 fathoms at night?—Yes, and within 100 fathoms of the shore too.

24,964. (*Professor Huxley.*) What you base your opinion on is this clause in the Act of Parliament: "And be it enacted, that, from the said 25th day of "July until the 25th day of December in any year, no "person shall fish for any hook fish, or throw or lay "any boulter or ground-tackle for taking fish, or "make use of any trawling-net or any other net not "belonging to and lawfully in use in the pilchard "seyne fishery under this Act within the distance "of 1000 fathoms from the shore within the limits of "any of the six several stems and stations in this "Act mentioned; and that every person offending "herein shall for every such offence forfeit any sum "not exceeding the sum of 10*l.*" Is that what you are referring to?—Yes, I am afraid of going within that distance for fear I should be fined.

WILLIAM ROBERTS re-called and examined.

W. Roberts.

24,965. (*Professor Huxley.*) Are you aware whether any prosecutions have taken place against any drift-fishermen under the clause of the Act which I have just read?—No.

24,966. Is it understood by the seine owners and those whose interest it is to enforce the Act that it is necessary to enforce that clause?—Yes, if it is infringed.

24,967. By night as well as by day?—I take it that according to your reading of the clause that it would be an infringement to come within 1,000 fathoms even at night. Yet, I have no doubt that it is infringed all the season through at night-time.

24,968. No one takes any notice?—No, I think not. I have heard it said that these boats go out at night, and that they go where they please.

24,969. Have no informations been laid or convictions been taken under that Act for a trespass committed under the Act?—I am quite positive that there has not.

24,970. (*Mr. Lefevre.*) Have you found any injury result from fishing during the night-time?—No; except in the morning when we are ready to put out. The drift-boats may hardly have got clear and away but have been drawing their nets as we go down. I recollect once or twice that the drift-boats have been enclosed in our seines; they have been fishing within the limits of our stems, when we have enclosed the fish and the drift-boats with all their materials. We never conceive that if they fish close in-shore in the night-time that it is really an infringement of the Act.

24,971. The seine owners have no objection to the drift-men fishing close in-shore in the night-time?—No, we never consider that that does us any injury, because we ourselves cannot work at night.

The witness withdrew.

WILLIAM ROUSE re-called and examined.

W. Rouse.

24,972. (*Professor Huxley.*) Although you feel that it would be a hardship to enforce that clause of the Act, yet we hear that it is not enforced in reality. Is that so?—We have been fined sometimes.

24,973. For drifting at night?—No, for bringing up.

24,974. By night?—No, by day.

24,975. What I am talking about now is drifting at night; when is your time for drifting; you do not drift by day?—No.

24,976. Then you have no occasion to interfere with the seining during the daytime?—No; we wish to drive from sunset to sunrise in any part where we think that we can do a night's work.

24,977. As we understand nobody interferes with you if you confine yourselves to fishing from sunset to sunrise?—I do not know how it would be at sunset. I think we might be meddled with then; the Act says, one hour after sunset and one hour before sunrise.

24,978. That is in the previous clause?—Yes.

24,979. With regard to anchoring within the limits of the stems?—Yes.

24,980. But there is nothing about driving or fishing. The previous paragraph to which you refer is this: "And be it enacted that no drift-net boat or "other fishing-boat or vessel other than and except "the boats employed in the said pilchard fishery "under this Act shall within the time between one "hour before sunrise and one hour after sunset, on "any day between the 25th day of July and the 25th "day of December in any year, anchor within the "limits of any of the six several stems or stations, "unless at a distance of more than 1,200 fathoms "from the shore; and the master or other person "having the care or ordering of any boat or vessel "anchoring within the said limits aforesaid contrary "to the said Act, shall forfeit any sum not exceeding "the sum of 5*l.* for every offence." By that clause you are not allowed to anchor within the limits?—No, 1,200 fathoms from the shore.

24,981. The penalty is 5*l.* for every offence?—Yes.

24,982. That relates entirely to anchoring?—Yes.

24,983. Not to driving within the limits?—No.

24,984. Do you know of your own knowledge that either you yourself or any of your friends and acquaintances have been brought up and fined?—Yes, for anchoring there by day.

24,985. That is contrary to the Act?—Yes.

24,986. Do you think that that is any particular hardship? Why do you want to anchor there by day?—I do not think that we have any occasion to go there to anchor by day, but the distance is not far to start from the harbour and go to shoot.

24,987. When you are anchoring there you are interfering with the seine-net people, without doing any good to yourselves?—I do not see that they have any right to anchor there, but I do not see why they should not drive there at the time the seines cannot.

ST. IVES.

W. Rouse.

1 April 1864.

24,988. As we understand that part of the Act has never been enforced. Have any of your acquaintances or friends ever been brought up for driving in the stems during the night?—I do not know of anyone about here who has been fined, but they have threatened to bring them up. I do not know whether they have a byelaw upon the subject.

24,989–90. You never heard of anybody being really brought up?—No, except for being there at anchor.

24,991. How do you think the supply of fish has been since you were a fisherman?—The fish have gone a great deal scarcer.

24,992. What sort of fish?—Hooked fish, the plaice and dabs, and herrings.

24,993. Has the whiting got scarcer?—Yes, it is not half so plentiful as it used to be when I first commenced fishing.

24,994. Do you have to go further out to catch it?—If we go out as far as we like we cannot catch it now.

24,995. How is that?—A great deal of the spawn has been killed.

24,996. What is the reason of the scarcity?—I think it is owing to so many hooks being shot, and to the use also of small tackle and boulters. They take up the smallest of all kinds of fish, and they kill all the spawn.

24,997. Do you like hand-line fishing better?—I think hand-line fishing suits all parties best.

24,998. Is hand-line fishing the old-fashioned fishing?—Most of the fishing now is carried on by boulters.

24,999. Forty years ago was there more hand-line fishing than there is now?—Yes, a good deal more than there is now.

25,000–1. There were not so many boulters?—No. The fish have gone scarcer since so many of them have been used.

25,002. Do they catch more fish with the boulters?—Yes, more than they do with the hand line.

25,003. Then do you think it is over-fishing that has made the fish scarcer?—Yes, together with the killing of the spawn. Of course if you were to kill all the boys there would be no men.

25,004. How do you contrive to catch small fish with the long line. Do you not use large hooks with the long line. You cannot catch small fish with the boulters?—Yes, we can; they are very small hooks.

25,005. What sized hooks do they use for the boulters?—I can hardly say, but they are very small.

25,006. You do not happen to have one here?—No.

25,007. If you catch very small fish you do not get a very good market for them?—Not so good a price as we get for the bigger fish.

25,008. What is the smallest whiting you have seen caught by the boulter here?—Not more than three or four inches.

25,009. There is not much sale for whiting of that size?—We have no whiting at all in regard to size compared with what we used to catch with the hand-line.

25,010. What do you use for bait for the boulters?—Generally launce or sand eels.

25,011. The sand launce?—Yes.

25,012. Do you use the same bait for the hand-lines?—Sometimes they use pilchards and herrings for bait.

25,013. Do you use any shell-fish?—Yes, mussels.

25,014. Do you get plenty of mussels here?—No, they are not plentiful on this coast.

25,015. But you get plenty of bait one way or another?—Yes.

25,016. Do you think anything ought to be done to prevent this falling off in the hooked fish?—Yes, I think drawing nets ought to be done away with.

25,017. (*Mr. Lefevre.*) The ground-seines?—Yes.

25,018. (*Professor Huxley.*) Is there anything else?—I think boulters ought to be done away with.

25,019. The boulters as well as the ground-seines?—Yes; let every one take his line and go out.

25,020. You would have nothing but hand-line fishing?—No.

25,021. (*Mr. Lefevre.*) How many ground-seines are there in use here?—Ten or a dozen, or more than that. There may be a score as far as I know. They never stop dragging them.

25,022. Where are they mostly used, just in the bay here?—Yes, and all the coves.

25,023. Wherever there is a sandy bottom?—Yes.

25,024. Have they been used ever since you can recollect?—Yes, but not one-fourth part as many.

25,025. Have they increased in number quite lately?—Yes, during the last ten years.

25,026. What has been the increase lately?—I cannot say.

25,027. Have they doubled the number?—Yes, I should think they have in that time.

25,028. Are they used all the year round?—In general they are used all the year round.

25,029. When the weather will permit?—Yes.

25,030. How many men are there employed in drawing them?—I cannot say, sometimes six or seven.

25,031. Six or seven?—Yes, or seven or eight.

25,032. What distance from the shore?—They go out with a couple of pieces of warp about 200 fathoms from the shore.

25,033. Are you the owner of a drift-boat?—Yes.

25,034. Do you go out to the mackerel-fishing with it?—Yes.

25,035. Do you go to the coast of Ireland in pursuit of herrings?—Yes.

25,036. Do any of your boats go to the Isle of Man?—Yes, I have been there many times.

25,037. And up to the west coast of Scotland?—Yes, I have been fishing there too.

25,038. From St. Ives?—Yes.

25,039. Do any of your boats go to the north and east coast of England?—I go up the Clyde, and right round.

25,040. What number of boats go to the Irish fishery?—Sometimes 50 or 60 sail, and sometimes not half that number.

25,041. How many go up to the Isle of Man?—I do not know the number.

The witness withdrew.

H. Geen.

HUMPHREY GEEN called and examined.

25,042. (*Professor Huxley.*) Are you a fisherman here?—Yes.

25,043. How many years have you been fishing here?—I suppose I have been fishing here for 30 or 40 years.

25,044. What sort of fishing have you practised?—All kinds of fishing.

25,045. Are you a long-line fisherman?—Sometimes.

25,046. Do you use the boulters?—Yes.

25,047. What do you think about the boulters, do you think that that is a good way of fishing?—Sometimes it is, and sometimes it does nothing at all.

25,048. Do you catch small fish with the boulter?—Not smaller than we catch with the hook and line.

25,049. Do you mean the hand-line?—Yes, the same hooks are used.

25,050. The same hooks?—Yes, the same are used in the hand-line fishing and with the boulters.

25,051. Do you not sometimes use smaller hooks with the boulters?—In general they are all of one size; there are small ones and big ones; the boulters are of different sizes.

25,052. Do the small ones use different hooks?—No, they are pretty much about the same, the same hooks are used with boulters as with hand-lines.

25,053. Then do they sometimes use small hooks with the hand-lines also?—Yes, for catching whiting.

25,054. Whether they are large or small the hand-line men and those who use the boulters have the same?—Yes, they are both alike, there is no difference.

25,055. Is there a great quantity of small fish caught by the boulters ?—Sometimes.

25,056. More than by the hand-lines ?—Yes, according as they come in the bay ; sometimes they come in in shoals.

25,057. Small fish ?—Yes, the whiting do.

25,058. Do you think the supply of fish caught by the hook and line has fallen off ?—I do not know that it has.

25,059. Within your recollection can you catch as many fish as you did formerly ?—Not so much as I have caught, at least not this season. Some seasons we get a good deal of whiting.

25,060. How has it been for the last ten years, taking one year with another ; comparing the last ten years with the ten years before that, do you have less whiting now than you used to have ?—I have been catching a good deal of mackerel during the last ten years.

25,061. Have you any distinct opinion upon the matter ?—Some seasons the fishing has been good and in other seasons bad. One season is not governed by another, some seasons are very good and some are only slight ; it is just the same with the mackerel and all other fish, some years we get a good catch and in others we have only a slight season.

25,062. Did you hear what the last witness said about the ground-seines ?—Yes.

25,063. Do you think they do much harm ?—I suppose they do good and do harm too.

25,064–5. How do they do good ?—They catch fish for the people to eat. Many in our town would not have a bit of fish if it was not for the tackle fish, and what is caught by these drawing-nets and by these blind-haul nets.

25,066. What is a blind-haul net ?—A ground-seine ; we call them blind-haul nets in St. Ives, because they cannot see what they are going to catch before they haul them in.

25,067. What is the harm done by them ?—Sometimes they catch small fish.

25,068. You think that does harm ?—Yes ; but I do not think they catch as much small fish as they do big ones. We never see many small fish.

25,069. (*Mr Lefevre.*) Have you yourself any share in a ground-seine ?—I have two.

25,070. You have two of your own ?—Yes; I made one here the other day.

25,071. (*Professor Huxley.*) Do you think the poor people are largely supplied by these ground-seines ?—Some are, and some of the fishermen are glad to go with them in order to get a shilling or two to buy a loaf of bread.

250,72. Do you think that the ground-seines do so much mischief that they ought to be put down ?—I do not know that they ought to be put down.

25,073. Do you think that they destroy the brood of fish ?—I do not believe they do.

25,074. How long have you had two of these ground-seines ?—Ever since I was a boy ; my father had one.

25,075. How often do you haul them ?—Perhaps once, twice, or three times in the night, sometimes four times.

25,076. At what time of the year ?—At different times ; perhaps now, if it was fine weather, they would be out with them.

25,077. Do you haul them on the sandy beaches ?—Yes ; sometimes we catch salmon and mullet with them.

25,078. Do you put back the salmon again ?—No, we take them up very carefully, because we generally can get a good price for them ; we take care of them more than we do of any other fish.

25,079. Has the net a pocket ?—No.

25,080. Only a bunt ?—Only a bunt, it is made of herring-twine. In the summer time we take all the Dungarvan out of it and use herring-net only.

25,081. What is the mesh with the Dungarvan only ?—About 20 to the foot.

25,082. Rather more than half an inch ?—Yes.

25,083. (*Mr. Lefevre.*) What is the value of a ground-seine ?—If we are going to have a bran new one it would cost about 20*l.*

25,084. (*Professor Huxley.*) Do you know when sprats are on this coast ?—Yes.

25,085. Have you caught them ?—We have sometimes.

25,086. At what time of the year ?—In the winter season.

25,087. In November ?—In November and December.

25,088. Are there many persons engaged in catching them ?—Sometimes.

25,089. Do they come in large quantities ?—They catch them for bait for the boulters for taking whiting.

25,090. You catch them for bait ?—Yes.

25,091. Not to sell ?—Sometimes they are sold.

25,092. Do they often come in large quantities ?—Sometimes they come in in shoals.

25,093. (*Mr. Lefevre.*) How many men does it take to draw in the ground-seine ?—Sometimes seven, and sometimes more.

25,094. Do you generally shoot the ground-seine at night ?—Yes.

25,095. Do you find that you catch a good number of small fish in them ?—Not so much as I have heard reported. Those who have not got any ground-seines generally speak against them.

25,096. What are the small fish you catch—turbot and sole ?—Yes, and plaice and flukes, and any flat-fish of that kind.

25,097. You mostly get flat-fish ?—Yes, it is flat-fish generally.

25,098. What do you do with the small fish ?—We generally sell all we catch.

25,099. Do you not throw any of the small fry back into the sea ?—When they are very small we throw them into the sea in order that they may get large.

25,100. When they are so small that they will not fetch any price in the market you throw them back again ?—Yes ; if we see any of that nature we let them lay in the water ; we do not meddle with them to kill them.

25,101. How many of these ground-seines are there in use along this bay ?—I don't know.

25,102. Are there many others besides yours ?—There are several of them, perhaps half-a-score, or somewhere in that way.

25,103. Do you go off the coast of Ireland after herrings ?—I have been there.

25,104. Where does the herring fishery generally begin there ?—At Howth.

25,105. Do you follow them up to the north coast of Ireland ?—Yes, to Douglas in the Isle of Man.

25,106. Do you come back again for the pilchard season here ?—Yes.

25,107. (*Professor Huxley.*) Is there any other remark you wish to make about the fishery here ?—No, there is nothing particular I wish to say except with regard to the drifting-boats. There has been some murmuring about their shooting here before and after sunset, but I do not think that the fishermen themselves think anything about it, because they can always go anywhere they like in the stems.

25,108. Nobody has meddled with the drift-boats when they have been fishing at night ?—No.

25,109. (*Mr. Lefevre.*) Where do the men who go to the Irish fishery sell their fish ?—At Howth there are buyers to buy it.

25,110. (*Professor Huxley.*) Do you think it would be a hardship if the drift-men were prevented from anchoring in the stems during the day ?—No; I do not see that they have any occasion to go there at all during the daytime.

The witness withdrew.

ST. IVES.

J. Cocking.

1 April 1864.

JOHN COCKING called and examined.

25,111. (*Professor Huxley.*) Are you a fisherman?—Yes.

25,112. How long have you been fishing here?—Upwards of 40 years.

25,113. What kind of fishing have you principally practised?—The mackerel-fishing and the pilchard and herring-fishing.

25,114. And hook-and-line fishing?—Yes, hook-and-line also.

25,115. Have you used the ground-seine?—Yes.

25,116. Do you possess one?—Yes.

25,117. Have you two?—I have two in number, one is for a shoal of fish.

25,118. Is the other used along the ground?—Yes, for drawing.

25,119. Do you work the drawing-seine pretty regularly?—Yes.

25,120. Do you get plenty of fish with it?—At times we do.

25,121. What sort of fish do you get most of?—Such as sole, or brill, salmon, bass, or mullet, and sometimes whiting. Sometimes we get a young cod-fish; we catch different sorts of fish.

25,122. Is there any other way of catching soles except by the seine-net?—Yes, by the trawl.

25,123. Is there only one trawl?—There may be two or three.

25,124. Is the principal catch of soles taken by the ground-seines?—Yes.

25,125. Do you bring up spawn in your net?—Yes.

25,126. A great deal of it?—Not a great deal of it, it depends how far we go from the shore.

25,127. When you speak of spawn do you mean small fish?—Yes.

25,128. What sort of small fish do you bring up?—Small plaice, and some other kind of flat-fish we call flukes or flounders, that is their general name; as many of these that we catch as are not saleable we heave back again into the sea if it is possible; we do not bring them home if they are not saleable; if we were to bring them home we should make a mere nothing out of them.

25,129. Then it is not worth your while to do so?—No, we heave them away again; all we do not consider saleable in a general way we heave overboard.

25,130. Do you think that you destroy a great quantity of unsaleable fish in that way which you cannot help destroying?—For my own part I do not think they do.

25,131. Do you think they get back again into the water alive?—We always throw them into the water; of course it hinders our time to some extent when we are taking up good fish to have to throw back again those that are not saleable. We do not injure the spawn if we can help it. Many a time I have hove the small fish into the sea again, and I suppose I have been engaged in fishing for more than 40 years.

25,132. Among the small fish what are the principal sorts you get, do you get small haddocks?—No; we do not get any of them in the drawing-seine.

25,133. Do you get small whiting?—Yes.

25,134. Considerable numbers of them?—No, very slight; I hardly recollect catching a basket of whiting in my life in the drawing-seine.

25,135. What is the chief sort of small fish you get?—The chief part we get in the drawing-seines consists of soles.

25,136. But I mean small fish?—There is some amount of small spawn, but if they were all big we should not make our fortunes. We get a good deal of plaice, and you must have a very large plaice to fetch 3*d.* in this place. It would take a very large one indeed to fetch 6*d.*, so that if we were to catch a great many of them we should not make much.

25,137. Do you not get small turbot?—Yes, we are very glad to catch them.

25,138. Do you not get small ones sometimes?—Sometimes not bigger than the palm of my hand, but as soon as we get them we heave them into the sea again, it would be of no use to carry them home. They might make something, but it would be very little and hardly worth having. Sometimes there are men with me blind-hauling and I charge them strictly to heave the young ones into the sea. I think there are now some blind-haulers in this room who have been with me.

25,139. Have you been long-lining?—Yes.

25,140. Have you found that the catch of fish in long-lining has been falling off?—Yes, just as my friend stated who was examined just now, some seasons are better than others.

25,141. But on the whole has there been a falling off during the last 10 years?—The fish have been scarce lately in summer as well as in winter. I do not know what has become of the spawn of them, neither do I know where all the spawn of the herrings is gone to for the last 20 years.

25,142. Has there been a falling off of the herrings lately?—Yes.

25,143. Have you heard the evidence which has been given already?—Yes.

25,144. Do you agree with it generally?—I suppose it will be the best way for every man to enjoy his own opinion.

25,145. Well, we want to know what yours is?—As far as I have stated I think I am pretty correct. I do not wish to say anything out of the way, and I do not think we shall ever make our fortunes by the drawing nets. I do not believe in that at all. I have two, a long one and a short one, and the short one I started with; I do not care very much about them. There is one I should not like to be without, and if anybody tries to cry them down, why then I shall endeavour to lift them up.

25,146. What do you mean?—I should not like to give up my long net it is about 28 years since my father got it up, and ever since I have been going round the shore looking out for shoals of mullet and shoals of bass. They pass our shore at this time of the year, and there are others to look out for them as well as myself, but I do not think there is anybody gives as great attention to that fishing as I do. I like it and I practise it, and I have got a net for that sort of work which I use whenever I have the opportunity. If that net were sacrificed it would do me a great deal of injury; at the same time I would not hold up my hand to keep it if all the others were destroyed. Of course I would not expect to keep mine more than other people.

45,147. Suppose the ground-seines do not catch mullet and bass, is there anything else to catch them?—Yes.

25,148. How are they caught?—By keeping a look out on shore for them.

25,149. Are they caught by the hook and line?—They may at odd times get mullet and bass by chance with a hook and line.

25,150. Are there any other men employed in catching them?—No, only those who have the drawing nets.

25,151. (*Mr. Lefevre.*) How many men are there who have these blind-haul nets?—I cannot tell to one or two, but there may be 10 or 12.

25,152. How often do you draw them in in the course of the season?—Do you mean in the course of the season or in the night?

25,153. No, in the course of the season?—I do not know. We may go 15 or 20 times in the course of the summer, the fish are so scarce, and generally the weather is so wet and cold that there are not many men who like to follow the employment.

25,154. How do you pay the men for helping you?—They get their equal part per share.

25,155. Does the owner of the net get no share?—If I am the owner I get my share the same as another man, and then two shares for the net. Every other man gets a share; they all share alike.

The witness withdrew, and the inquiry was adjourned until May 7th, at Shoreham.

Shoreham, Sussex, Saturday, 7th May 1864.

PRESENT:

JAMES CAIRD, Esq., M.P. (Chairman). | Professor HUXLEY, F.R.S.

GEORGE GRIGGS called and examined.

25,156. (*Mr. Caird.*) Have you been long connected with the fishing interest of Shoreham and its neighbourhood?—I have.

25,157. For many years?—Yes; I was the first man who introduced the trade into Shoreham of sending oysters to London by rail.

25,158. When was that?—About 15 years ago.

25,159. Had you any previous connexion with the fishing interest of Shoreham?—I have been connected with it ever since I was a lad, for about 40 years.

25,160. Are oysters the chief kind of fish that are caught at Shoreham?—Yes.

25,161. Are there any others?—No, we have no trawling here at all.

25,162. The trade of the place is in oysters?—It is.

25,163. Can you tell us how many people are engaged in it?—No, I do not think I can, there is such a number of boats that come from Colchester and other parts.

25,164. Do they come from Colchester to Shoreham for the fishing here?—They come into Shoreham with their oysters and we buy them. Some go to Newhaven and Littlehampton and elsewhere along the coast.

25,165. You cannot tell us how many people are engaged in the oyster-fishing out of Shoreham Harbour?—No, not at present.

25,166. Is the number increasing or diminishing or is it stationary?—It is increasing.

25,167. Do you speak of the whole period of the last 15 years?—We have more oyster-fishing in Shoreham now than we had 15 years ago, more than we had six years ago; it is increasing every year.

25,168. Was there any dredging at all previous to 15 years ago?—Yes, a good deal.

25,169. At an earlier period than 15 years ago, and before you commenced the trade to London, were oysters caught in the deep sea and brought into Shoreham?—Yes, 39 years ago.

25,170. Has the trade gone on increasing ever since that time?—Not all the time. I used to go dredging myself along the coast by Worthing upwards of 30 years ago, and I sometimes saw as many as 200 sail.

25,171. During what months is the fishing carried on with the greatest vigour?—It used to be carried on all the year round until they put a stop to it.

25,172. How long ago was that?—Between five and six years ago. The Custom House officers seized the gear.

25,173. You are speaking now of the deep-sea fishing?—I am.

25,174. Was that in consequence of the Convention with France?—It was.

25,175. And it began between five and six years ago?—It did.

25,176. Previous to that time were you in the habit of fishing on the deep-sea oyster beds during the whole year?—Yes, the whole year round, but then the Frenchmen began to cruize about and take the dredges away, sometimes heaving the oysters overboard.

25,177. During the last five or six years there has been no deep-sea fishing for oysters after the beginning of May?—No, none from May till September.

25,178. Then there are no oysters brought from the deep-sea beds into Shoreham between those months?—None.

25,179. Is that a great hardship to you?—I think so; it keeps a great many people out of employment.

25,180. You say the oyster trade has increased within the last few years; has it increased notwithstanding the fact that you are prohibited from fishing during the fence months?—We have no oysters brought in here during those months; it is different Essex way.

25,181. I am speaking now of the oyster-fishing at Shoreham alone. I understand you to say it has increased considerably in recent years, but you also say that within the last five or six years there has been no importation of deep-sea oysters during the fence months. What I want to know is whether, notwithstanding that prohibition, the supply of oysters has increased?—No, it has decreased, because we get no supply during the fence months.

25,182. Will you describe to us the system followed here from the time you catch the oysters in the deep sea till the time you send them to the London market?—We begin fishing in September; that is the worst month for deep-sea oysters. In May and June they are in the best condition.

25,183. You begin to catch them in September and you go on during the winter and spring, leaving off at the beginning of May, and as they are caught in the deep sea you bring them in boats to Shoreham. What is done with them then?—We send them to London and to all parts of England.

25,184. When do you begin to take them off the ponds in Shoreham Harbour?—That depends upon the demand for them. Sometimes they are taken off in a day or two.

25,185. Then during the whole season you are sending them from Shoreham?—Yes, during winter and spring.

25,186. Have you yourself been upon the deep-sea oyster beds in mid-channel?—No, I never dredged there.

25,187. You do not of your own knowledge know anything of the state of the beds there?—I only know what has been told me.

25,188. Do these beds continue to yield as largely as ever they did?—Some beds do not, but others do. There are plenty of beds in the English Channel, but where the men are continually dredging there are not so many oysters as there used to be.

25,189. What kind of oysters is brought from the deep sea to Shoreham?—Very large ones.

25,190. They are very different from the natives, are they not?—Yes, they are. Our dredges will not catch small oysters. The rings are $2\frac{1}{4}$ inches and the meshes of the net are 4 inches. They don't take small oysters at all, in fact we don't want them.

25,191. Can you give us any idea of the quantity of oysters that may be brought in here during the fishing season from the deep sea?—I cannot.

25,192. Do you always put the oysters you bring in from the deep sea into the ponds in Shoreham Harbour before you send them to market?—Always.

25,193. You never send them direct from the boats to market?—Never.

25,194. What is the reason of that?—If they are allowed two or three days in the ponds they get cleaner and better.

25,195. Do they spawn in the ponds?—Very little. That is not the time of the year for spawning. We are not allowed to dredge during the summer months, and the spawning season is from the middle of July till the end of August, during the hot weather.

25,196. That is in the deep sea?—Yes.

25,197. Then you do not make it a business to breed oysters here?—No, not at all.

25,198. You merely use your ponds as storing places, that is the sole object?—It is.

25,199. With the view of enabling you to supply the market regularly?—Yes.

25,200. Does that supply go on during the whole summer?—No, we cannot get enough then.

25,201. Which months are the best for the Shoreham oysters?—We say May and June. During those two months if we got more we could sell as many again as at present. Ours are large oysters, and in the warm weather there is a great demand for them.

25,202. Do they remain long in the ponds in the harbour?—That depends upon the state of the market. Sometimes they are one month sometimes two months in the ponds.

25,203. Do the oysters you bring from the deep sea in one season ever remain in the ponds till the next season?—Never.

25,204. They are always disposed of during the same season?—Always.

25,205. To what market chiefly do you send them?—The London market.

25,206. Do they all go to London?—A great many do, but from London they are sent all over the country. I send them to many of the principal towns in England—Manchester, Leeds, York, Hull, Newcastle, and other places.

25,207. Is there any loss sustained in the ponds from frost?—Sometimes there is loss in that way.

25,208. Any serious loss?—Not much, I think, because we have not many oysters at that season.

25,209. Does fresh water injure the oysters in the ponds?—Yes, it does.

25,209*a*. Sometimes loss is sustained from that cause?—Yes.

25,210. You cannot speak of the beds in the Channel from your own knowledge?—No, I cannot; but I daresay there are men in this room who can. I know that if we could dredge for two months longer the ground would be thoroughly cleaned, and then the spat would live.

25,211. How can you tell us that if you do not know the beds yourself?—I know very well what an oyster ground is. If it is clean the spat will lodge on the stones and shells, and will live. But in the summer months, when there is no dredging, a deal of weeds spring up on the ground, and if the spat lodges on weeds it will die.

25,212. What do the fishermen who go to the deep-sea beds say as to their not being allowed to fish after April?—Some would like to dredge one month longer, some two months.

25,213. You mean they would like to dredge in May and June?—Yes.

25,214. Some would be satisfied with May?—They would.

25,215. Because they think an extension of the fishing season over May would be a great advantage to them?—That is it.

25,216. Are the fish in as good a condition in September as in May?—No, they are in a worse condition then.

25,217. The deep-sea fish are not in good condition in September?—No, they are not. Oysters spawn in August, during the hot weather, and they are very weak in September.

25,218. Are they in good condition in May?—Yes, and in June too.

25,219. Then you would think it an advantage if a month were added to the end of the season and taken off the beginning, so that the fishing should commence in October and close in June?—It would be an advantage to the fishermen and to the grounds also.

25,220. Are there any beds near the coast?—There are beds all over the Channel.

25,221. But are there any within three miles of the shore?—No, not to do any good with.

25,222. Do you know the limits of the deep-sea fence months in the Channel?—There are no fence months to the east of the North Foreland.

25,223. Fishing is not allowed during the fence months on this side of the North Foreland?—None at all.

25,224. And there are no fence months on the other side of the North Foreland?—No.

25,225. The existence of fence months on this side is in consequence of the Convention with France?—Just so.

25,226. Are there any Revenue, Custom House, or other Government officers who enforce the articles of the Convention within the prescribed limits?—Yes, there are.

25,227. Do you know where the Essex fishermen get the deep-sea oysters with which they supply their beds during the fence months?—I cannot tell that. I could tell if I saw the oysters.

25,228. But you do not know?—No, because I have never been to see them.

25,229. Could the Shoreham fishermen go upon the same ground to supply themselves during the fence months?—I cannot see why they should not. They are not allowed to bring their dredges in here, but I do not suppose there is any law which permits oysters to be seized, although that was done once.

25,230. The law only allows the gear to be seized?—Yes, but the oysters were seized once, though only once in Shoreham.

25,231. Do you suppose that if anybody were to fish on the oyster beds in the Channel, and then carry the oysters to the other side of the North Foreland, any fault would be found with him?—The Government officer might ask him where he got the oysters, and he might say east of the North Foreland, where there are no fence months.

25,232. Do you think that during the fence months any fish are caught on the grounds closed by the Convention with France?—There is no doubt about that at all.

25,233. Is there any prohibition to your taking dredges in your boats from one part of the coast to another during the fence months?—There is; dredges are not allowed to be taken out of Shoreham from May to September.

25,234. In what respect is that a grievance?—Because the dredges might be used somewhere on the other side of the North Foreland.

25,235. But you are not allowed to take dredges out of this harbour at all during the fence months?—No.

25,236. East of the North Foreland you could take dredges out?—Certainly; but here the cutter takes away the gear.

25,237. Has the price of oysters increased or diminished, or has it remained stationary during the last few years?—It has increased.

25,238. Within the last year or two?—Within the last two years, but particularly last year.

25,239. What was the cause of that?—Because the Frenchmen have been buying so many; the French merchants get nearly all their supplies from English vessels.

25,240. Do the French merchants come to buy oysters in your harbour?—They do.

25,241. Is there any large quantity of oysters sold to go to France?—There is.

25,242. Does it form any considerable proportion of the whole fish caught?—It does; but we are obliged to keep some for the London and other markets.

25,243. Is one half of the whole take sent to France?—No.

25,244. One fourth?—I do not know, but at Newhaven very nearly all the fish are sent to France.

25,245. Has the fact of the French merchants buying so many increased the price?—It has.

25,246. Do your smacks go into the French ports?—The Jersey smacks go, but they won't allow our smacks to go.

25,247. Do you think it would be an advantage to the fishermen here if they were allowed to carry their oysters in their own boats direct to the French market?—They would like of course to go to the best market.

25,248. Would they make the most money if they were allowed to go direct to the French market?—No doubt of it, but the French ports are only open to the Jersey smacks.

25,249. Are the beds which yield the best oysters and the largest quantities, nearer the French coast than the English coast?—I think they are in general.

25,250. Then if the French ports were open to them it would be a shorter run for your smacks?—It would.

25,251. It would also be an advantage to your fishermen to be allowed to go either way according to the wind?—Yes.

25,252. But at present English smacks are prohibited from taking fish into a French harbour?—Yes, to sell them.

25,253. But in point of fact do English fishermen ever take oysters into a French port?—Sometimes they are allowed to take a few in, but there is a duty on English vessels carrying in fish in that way.

25,254. (*Professor Huxley.*) You have said that you yourself dredged many years ago?—Yes.

25,255. How many years ago?—When I was a young man.

25,256. You dredged off this place?—Yes, 39 years ago.

25,257. Did you go to the deep-sea beds?—No, I dredged along the coast.

25,258. At that time were there considerable oyster beds near the shore?—Yes, there were.

25,259. What has become of them?—They are fished out.

25,259*a*. Then there is no oyster-fishing at that distance from the shore now?—None to speak of.

25,260. None of any consequence?—None.

25,261. How far out do your boats go now?—Sometimes 60 miles, sometimes 50. Sometimes they see the English land, sometimes the French, sometimes no land at all.

25,262. Are steam-dredges ever used in the deep-sea fishing?—No.

25,263. You never heard of that?—Never; I don't know what a steam-dredge is.

25,264. Have you never heard of a steamboat being used to drag the dredge along?—That is a different thing. A dredge is one thing, and a steamboat to drag the dredge along is another.

25,265. But have you ever heard of steamboats working dredges?—I have heard tell of them, but never saw them,

25,266. Are they employed on the deep-sea beds at all?—Not from Shoreham.

25,267. Is the weather bad here in October and November?—Yes, sometimes.

25,268. Bad enough to prevent the smacks going out?—Yes; at that period there are short days and long nights; the weather is coarse and bad, and sometimes the smacks cannot go out for a week—sometimes for a month.

25,269. You own a boat yourself?—I do.

25,270. Only one?—Yes; but I used to have more.

25,271. Is your boat as big as the others?—It is as big as any that goes from Shoreham.

25,272. What size is it?—Twenty-seven tons new measurement.

25,273. It is decked, of course?—It is.

25,274. And can keep the sea?—Yes.

25,275. How is it rigged?—It is dandy rigged.

25,276. What is about the cost of a vessel of that kind?—If she were built new and fitted out complete she would cost 600*l*.

25,277. What sort of dredge do you use; what is the weight?—From 35 to 40 lbs.

25,278. The dredge alone?—Yes, the dredge itself.

25,279. How wide is the mouth?—About $2\frac{1}{2}$ feet or 3 feet.

25,280-1. When your smack goes out, how long does she take with a fair breeze to get to her ground?—About six or seven hours.

25,282. How long does she dredge?—In fine weather all the week—till Friday or Saturday.

25,283. She has to keep the sea for a week?—Yes, she has. The smaller boats cannot keep the sea in rough weather, but are obliged to go into harbour. Sometimes they are only out one day.

25,284. That depends upon the weather?—It does.

25,285. But in fine weather they dredge for a week?—Yes.

25,286. Do you put all the oysters into the hold?—Yes.

25,287. Don't they spoil in the hold?—No; in fishing weather they will keep for a week, or even a fortnight.

25,288. Do they dredge at night as well as during the day?—Yes.

25,289. Did you ever hear of an article in the Convention about dredging at night?—According to the Convention they should not dredge after sundown.

25,290-1. Does anybody look after them to see that no fishing takes place at night?—No; it would be a great hardship if they were not allowed to dredge at night. Sometimes they cannot dredge at all during the day, and then they begin, say in the afternoon, and dredge all night. If they were not allowed to dredge at night they would sometimes get no fish at all. The men could not make a living.

25,292. How is the bag of your dredge made?—With iron rings of $2\frac{1}{4}$ in. and 4 in. meshes.

25,293. Does the bag wear out pretty fast?—It does.

25,294. What sort of bottom is it where you fish?—At some places it consists of shells and stones, at others of all sorts of things.

25,295. What is the cost of a dredge?—About 25*s*.

25,296. How many do you use in a season?—I have lost five this season. Others have lost two or three.

25,297. That is by fouling?—Yes, by catching on rocks and such like.

25,298. You would not expect to lose so many from ordinary wear and tear?—No.

25,299. Are the oysters picked when they come on board, or are they put into the hold without culling?—They are picked, and shells and things of that kind are thrown into the sea again.

25,300. Is care taken to catch the right-sized oysters only?—Yes; the rings are $2\frac{1}{4}$ in. and the meshes of the net 4 in.

25,301. But the regulation is that no oyster less than $2\frac{1}{2}$ in. over the greatest diameter of the shell should be taken. Now your rings are only $2\frac{1}{4}$ in. How, then, can you avoid taking small fish?—We find that small oysters always work through the meshes, which are 4 in.

25,302. Does anybody inspect the cargo when it comes ashore?—No.

25,303. So that if there were a few oysters less than $2\frac{1}{2}$ in. nobody would be the wiser?—No, but there are none brought in less than $2\frac{1}{2}$ in. What are brought in are too large rather than too small. We should be glad to see them smaller.

25,304. Why?—Because the large ones don't sell so well. We have sometimes oysters brought in that will not go more than 250 to the London bushel. At some parts of the ground we get them 300 to the bushel, and at others 500 to the bushel.

25,305. How long have they been fishing upon the deep-sea oyster grounds from this port?—About 17 years.

25,306. You have said that the number of smacks fishing in that way is increasing?—Yes.

25,307. How many are there altogether?—I cannot tell. Some go to Newhaven, and some to other places. There may be 300 sail altogether.

25,308. But how many from this port?—I cannot say at present.

25,309. Is the yield of oysters still good?—Yes.

25,310. You don't find any falling off?—No; the men find fresh grounds.

25,311. Are there any complaints of the beds getting fished out in consequence of the increased number of boats?—No.

SHOREHAM.

G. Griggs.

7 May 1864.

25,312. I understand you do not keep the oysters long in the ponds in the harbour?—We do not.

25,313. Is that because the demand is so great?—It is.

25,314. Supposing you were to work as hard as possible during the open months, for how many weeks' demand in May and June could you provide?—Perhaps for six weeks' demand, if all the ponds were full.

25,315. Could your ponds not accommodate more than that?—They could not, but I do not suppose we could get more fish.

25,316. So that the accommodation afforded by your ponds is not enough to allow you to provide for more than six weeks' demand, however hard you might work during the open months?—It is not.

25,317. Could you not get more accommodation?—We cannot get the oysters.

25,318. Supposing you could get the oysters, could you provide more accommodation?—Yes, we could make more ponds; but we do not want to do so, because we cannot get the fish.

25,319. But, supposing it were desirable, could you provide more pond accommodation?—Yes, we could increase the number of ponds.

25,320. Could you make as many as you might want?—I suppose so.

25,321. By employing more smacks could you not get almost as many oysters as you like from September to April?—We cannot get more smacks; the number is greatly increased.

25,322. Supposing the present regulations were to remain in force, would it be possible to increase the number of ponds and to stock them sufficiently to provide for the summer demand?—No, because we could not get the oysters. We have a great quantity to send to the London market, and, besides, the Colchester men take a great many away.

25,323. If the Colchester men can come here and fish in the deep sea, carrying the oysters to their own beds, why cannot you go to their grounds for a supply for your ponds? Supposing a smack were to come in laden with oysters during the fence months, would the cargo be seized?—I don't know. We have never tried the question since the order came down from the Custom House to seize the oysters.

25,324. Surely, with the great demand for oysters, it is worth while ascertaining the state of the law?—We are all poor people, and cannot stand against the Government.

25,325. All that has been done hitherto has been to seize the dredges?—Yes.

25,326. No oysters have been seized here?—Only once, and no oysters have been brought in since.

25,327. There were oysters seized once?—Yes.

25,328. How long ago?—About six years ago.

25,329. By whose orders?—By the orders of the Custom House people. They took the oysters out of the vessel.

25,330. Did nobody think it worth while to try the legality of that?—No, and not a word has been said about it since.

25,331. So you feel yourselves prevented from landing oysters here during the fence months?—We do.

25,332. And your great complaint is that just round the North Foreland, your fellow countrymen are not prohibited in the same manner?—Yes.

25,333. And can compete with you at an advantage?—Yes; they are allowed to take out their gear and we are not.

25,334. (*Mr. Caird.*) Are you quite certain that is the case?—Yes.

25,335. Have you any proof of it?—I have been told of it.

25,336. Do you know whether the Frenchmen fish much upon the deep-sea beds?—I think they always close at the beginning of May.

25,337. But during the open months do they frequent the beds much?—Yes.

25,338. Are there as many French boats on the beds as English ones during the open months?—I do not believe there are, but there are some men here who can speak to that better than I can do.

25,339. Do you know whether the people of any other nation fish upon these beds?—I do not know.

25,340. Are there any Dutchmen?—No, I think not. I never heard tell of any but Frenchmen and Englishmen in the Channel.

25,341. You sell the oysters by the bushel?—Yes.

25,342. Do you know how many natives there are in a bushel?—From 1,400 to 1,600.

25,343. And what is the price at present?—70*s.* or 72*s.* the bushel.

25,344. Are the Jersey oysters intermediate between the natives and the Shoreham oysters?—Yes, but we get no Jersey oysters now.

25,345. The Shoreham oysters run from 250 to 500 in the bushel?—Yes.

25,346. What is the price per bushel of the Shoreham oysters at present?—7*s.* 6*d.* and 8*s.* The price varies according to the quality.

25,347. Do you mean that natives bring 70*s.* or 72*s.*, and Shoreham oysters only 7*s.* 6*d.* or 8*s.*?—Yes, here.

25,348. Take the London market?—In London the Shoreham oysters may bring 10*s.*, but that is on account of the expense of getting them to the London market.

25,349. In London Shoreham oysters bring 10*s.* per bushel and natives about 70*s.*?—Yes. There are some kinds of oysters which bring from 20*s.* to 25*s.* the bushel.

25,350. Shoreham oysters vary in size from 250 to 500 in a bushel. Is there much difference in quality?—There is not.

25,351. Are the smaller better?—They are no better in quality, but they are better for the retailers.

25,352. And therefore fetch a higher price?—Yes, perhaps 1*s.* more. The people who sell oysters two or three for a penny will give more for small oysters than for large ones, buying them by the bushel, because there are more of them.

25,353. Has it been a prosperous business for the fishermen here?—Yes, very good this spring, because the prices have been good. Some have done well, but others not so well.

The witness withdrew.

S. Saunders.

SAMUEL SAUNDERS called and examined.

25,354. (*Mr. Caird.*) You are the harbour master here I understand?—Yes.

25,355. Have you been long here as harbour master?—I think it is now 22 years.

25,356. Can you tell us the number of boats engaged in the oyster fishery that frequent this harbour?—No, I cannot.

25,357. Nor the number of fishermen engaged in oyster-fishing?—No, we do not keep a register of the number of boats or fishermen. We only keep a register of the vessels which pay the dues. We keep a register of all the vessels which pay the dues. Fishing vessels are exempt from paying dues.

25,358. The fishing vessels pay no dues here at all?—No, but I think they do at the Custom House.

25,359. (*Professor Huxley.*) They are registered at the Custom House I suppose?—I think they are, but I am not able to state precisely; the Coastguard, however, knows the whole of them.

25,360. (*Mr. Caird.*) Have you no means of ascertaining the number of boats or of men engaged in the oyster-fishing here?—No, none at all.

SHOREHAM.

S. Saunders.

7 May 1864.

25,361. Are you able to say whether the number of late years has been increasing or diminishing?—I should say that it has been increasing.

25,362. Has it increased much within the last five or six years?—It has increased within the last two years, and I think also for some years previously.

25,363. To what cause do you attribute that increase?—I can hardly say, unless it is owing to the greater demand for oysters.

25,364. Have they fetched a better price?—Yes, and this has induced other people to take part in the fishing.

25,365. Has there been a larger importation of oysters from the deep sea?—Yes, much larger.

25,366. Is it still increasing?—I should say that it is, I judge so from the number of beds we have here.

25,367. The number of beds here are increasing?—Yes.

25,368. Are they increasing every year?—Yes.

25,369. Is there still plenty of space for the further increase of the beds?—There is not a very great deal of space. There is a little on the eastern branch, but there are not many good places on the western branch beyond those which are at present occupied.

25,370. Can you yourself give us any information as to the advantage of allowing the oyster-fishing to be continued here during the month of May?—I am not practically acquainted with the question, but I know what the opinion of practical men is.

25,371. What is their opinion?—They all seem to agree that no harm would be done by extending the months for fishing so as to include the month of May.

25,372. You have no knowledge upon the subject yourself?—No, I am not practically acquainted with it.

25,373. Is it within your knowledge that the oyster-fishing here has been a prosperous business for the fishermen?—I think it must have paid our people, or they would not have embarked in it as they have done.

25,374. Are there a good many boats coming from different parts of the coast and engaging in the fishing?—Yes, the number has increased in that way.

25,375. Have you ever heard any of the fishermen complain that while they are prevented from fishing, in consequence of the fence months maintained here, the oyster fishermen to the east of the Foreland are able to continue their fishing?—Yes, I have heard such complaints. I have heard them say that they are prevented from fishing at a time when they could manage to catch very good oysters. I have no doubt that the French people watch them pretty narrowly, but I suppose that they sometimes dredge during the night and escape them in some way. If they succeed in passing the Foreland they get clear altogether.

25,376. I understand that of your own knowledge you do not know anything of this?—No.

25,377. (*Professor Huxley.*) Do you know of any other kind of fishing being practised here except oyster-fishing?—There is very little indeed of any other kind of fishing.

25,378. Have you no hook or line fishing?—No.

25,379. Is there any herring-fishing?—There are some boats which belong to Brighton and Hastings which occasionally frequent this harbour in bad weather.

25,380. But you have no boats belonging to this place which are regularly engaged in herring-fishing?—No, I think not.

25,381. (*Mr. Caird*) Are there any salmon in this river?—No.

25,382. (*Prof. Huxley.*) I understand you to say that there has been a great increase in the oyster-fishing here, and that the prices obtained for the oysters are higher than they were in former years?—Yes.

25,383. Do you think that the railway has had anything to do with the increase of the oyster-fishing?—Yes, I think it has.

25,384. The railway station here must have afforded immense facilities for transporting the oysters to London and other towns in the interior of the country?—Yes.

25,385. How long have you had a station here?—About 22 or 23 years.

25,386. As long as that?—Yes, I suppose the line we have here was the first portion opened; it was opened before the main line was completed.

25,387. How long has there been a regular run up to London from Shoreham?—About 20 or 21 years.

25,388. A great increase in the oyster trade has taken place here within the last 16 or 17 years?—Yes, or even less than that.

25,389. Within what length of time has an increase been noticeable here?—Perhaps within the last 15 years. I think this will be the fifteenth year.

25,390. (*Mr. Caird.*) Can the large smacks come into your harbour at any state of the tide?—No, not at low-water. Perhaps at low-water neap tides they might be able to get in.

25,391. Is this the only harbour along the coast that they could take at high water or at half tide?—I think there is about the same depth of water at Newhaven as we have here, but at Littlehampton there is not so much.

25,392. Is there no harbour into which these smacks could put nearer than Newhaven?—No.

25,393. Then I presume that naturally, from its position as a harbour, it is able to command a large proportion of the deep-sea oyster-fishing?—We have greater room here for laying oysters down after they are brought in than they have at Newhaven or Littlehampton. In those harbours there is very little space that can be adapted for such a purpose.

25,394. You have peculiar facilities here for that purpose?—Yes.

25,395. The tide runs up a long way inland?—Yes, we have a great deal of room here, and we have therefore made beds upon which we lay the oysters down. In doing this the people interested in the oyster fishery here have not interfered with the navigation. The Navigation Commissioners, I believe, gave their permission to the formation of the beds, provided that the navigation was not interfered with.

25,396. Do you think that the facilities you have for forming oyster beds increase the oyster fishery here?—Yes, there can be no doubt of that.

25,397. Together with the convenience of your harbour?—Yes.

25,398. I suppose it is a safe harbour to run to?—Yes, it is very safe indeed.

25,399. What depth of water have you in the harbour?—There are about 15 feet of water in the harbour at high-water neap tides, and about 20 feet of water during spring tides.

25,400. Your boats are engaged in the oyster-fishing during the winter?—Yes.

25,401. Are there many boats lost when so engaged in the winter months?—I think not.

25,402. Then there is not much loss of life or property in connexion with the oyster fishery?—I never heard of much. There are very few boats lost from this place.

25,403. Are they good sea boats?—They are most of them very nice little craft indeed.

25,404. I understand you to say that of your own knowledge you do not know anything with regard to the mode of fishing practised in the Channel oyster fishery?—Nothing whatever; I have never been engaged in it practically.

The witness withdrew.

S. Allen.

Samuel Allen called and examined.

25,405. (*Mr. Caird.*) You are the master of a dredge-boat, are you not?—Yes.

25,406. Have you had considerable experience in connexion with the oyster-fishing?—I have been engaged at it all my life, ever since I was 13 years old.

25,407. What is the tonnage of the boat of which you are master?—25 tons.

SHOREHAM.

S. Allen.

7 May 1864.

25,408. Is it a decked boat?—Yes.

25,409. How many men have you on board of her as the crew?—Six altogether; there are five besides myself.

25,410. Is that the usual crew of an oyster-boat?—Yes, we generally carry six at the oyster-fishing.

25,411. But yours is rather a small-sized boat, is it not?—No, it is a fair size.

25,412. What is about the average tonnage of the oyster-boats at Shoreham?—They average from 20 to 25 and 27 tons.

25,413. Have you nothing larger than that?—No.

25,414. You are giving me the tonnage according to the new measurement?—Yes. Some of them would be 50 tons by the old measurement, and 27 tons according to the new measurement.

25,415. Whereabouts in the Channel are the other beds where you get the most successful fishing?—They extend from Beachy Head over the deep sea, right across the Channel, and from the Isle of Wight to Havre.

25,416. Within what distance of Beachy Head are you able to find oysters?—About 20 miles sometimes; sometimes 25, and sometimes 30.

25,417. Is there any particular place in the Channel where you can go to and always be quite sure of finding oysters?—No, we have to look about for them until we find them.

25,418. If, for instance, you go out between Beachy Head and Dieppe are you sure to come across them?—Yes, we should be almost certain to find oysters somewhere or other.

25,419. Are you in the habit of constantly changing your ground when you are engaged in the oyster-fishing?—Yes, almost every week we are fishing at different places.

25,420. Do you not go much east and west of the line which you mentioned just now?—No, we do not go much east of Beachy Head.

25,421. Do you go far to the west?—Yes, we go a long way sometimes to the west.

25,422. How far west do you go?—Down to the Isle of Wight.

25,423. How far off the land?—From 22 to 23 or 25 miles.

25,424. Now in all parts of the Channel, from Beachy Head to the Isle of Wight, can you find oyster beds?—Yes.

25,425. Are they very plentiful?—In some places they are, and in other places there are none. Occasionally we come upon a sandy bottom or beds of stone where there are no oysters, but in other places we find them very plentiful.

25,426. Do you think that there are many oyster beds in the Channel which neither you nor anybody else has yet happened to come across when you have been fishing?—Yes, there are plenty of oyster beds in the deep sea which have not yet been fished; there can be no doubt of that.

25,427. Do you find that you are at all exhausting the beds now?—I do not see much difference in them.

25,428. Are you getting as many oysters now upon the beds you frequent as you have been in the habit of getting?—Yes.

25,429. Do you get more now than you did in former years?—No, I do not know that we get more, but we get quite as many.

25,430. You have noticed no falling off?—No, we can get as many now as we were able to get 10 years ago.

25,431. Are there more boats going now to the oyster fishery than there used to be when you first commenced?—Yes, there are a great many more than there were some years ago. All the Jersey fleet come to fish in the Channel now, and a few years ago there were none.

25,432. Why do the Jersey boats go there?—The Jersey grounds have all been a loss of late years, and they therefore come into the Channel where we fish.

25,433. How many boats are there engaged in fishing on these grounds altogether?—I can hardly say, but there will be as many as 300 sail in the course of a season.

25,434. Are many of them French boats?—I am not speaking of the French boats, I do not include them in that number.

25,435. Are there many French boats fishing on the same ground?—Yes, a good many.

25,436. How many?—200 sometimes.

25,437. Besides the 300 English boats?—Yes.

25,438. Then there will be 500 altogether?—Yes, I daresay there will be, French and English altogether.

25,439. Are the French boats of the same size as those which you use?—No, they are generally larger.

25,440. How much larger are they?—Some of them will be boats of 100 tons.

25,441. Are they more successful in the oyster-fishing than your boats?—No; they do not catch as many oysters as we do.

25,442. Then do you think that there is a larger supply caught in the English Channel by Englishmen for the English market than there is caught by the Frenchmen for the French market?—I do not know.

25,443. Do the French boats use the same description of dredges that you use, or are they different?—Some of them use the same kind of dredge and others do not. Formerly they were all different, but of late years they have had dredges similar to ours.

25,444. Have they been gradually getting rid of the old dredges and having others of the same description as those you use?—Yes. Some of them have had dredges made at Shoreham and sent over to France.

25,445. Just the same as yours?—Yes.

25,446. Is yours a handier kind of dredge than theirs?—Yes, it is handier for us. We should not like to be obliged to use the one they have.

25,447. Are their dredges very cumbersome?—They are very large and bad to manage as compared with ours.

25,448. Do they catch more oysters with them than you do with yours?—I do not know. I don't think they do; but I am not able to say whether they do or not correctly.

25,449. Do you ever dredge for oysters during the night-time?—Yes; if we did not dredge at night we should find it very difficult at times to get a living.

25,450. Do you catch more at night than you do during the day?—No.

25,451. Do you continue dredging as long as you remain out on the fishing grounds, whether it is day or night?—Yes, we keep at it as long as we can.

25,452. How long are you out altogether?—Do you mean on each voyage?

25,453. Yes; how long on the average, when you leave the harbour and go to the fishing, do you remain out at sea?—All the week if the weather is fine, we go according to the wind and weather.

25,454. When you remain out as long as a week at a time do the oysters keep in perfect order all the time?—Yes, we bring them in alive and fresh.

25,455. Do you keep any water in the hold for the purpose of keeping the oysters in good condition?—No.

25,456. I believe you commence with the oyster-fishing in the month of September?—Yes.

25,457. Do you find that the oysters are in good condition then?—No, they are not.

25,458. When do they begin to get in good condition?—Not until the next month.

25,459. The month of October?—Yes.

25,460. What are your best fishing months?—We think the best fishing months are two of the summer months, when we are not allowed to fish, May and June.

25,461. Do you go on fishing for oysters during the whole of the winter months, from September until the end of April?—Yes.

25,462. Which of the months on the whole is most productive of oysters? Have you observed any particular difference, taking one month with another?—

When we first begin the oysters are not as good as they are afterwards.

25,463. Do they get better as the season progresses?—Yes.

25,464. Do they also become more plentiful?—No, they are not more plentiful.

25,465. But they get better in quality?—Yes. When we first commence fishing in September the young oysters have not sufficient strength to enable them to live if they are taken up, nor at that time are they fit to sell or to eat.

25,466. In the month of October are they better in quality?—Yes, they are a great deal better then.

25,467. Do they continue to get better as the season goes on?—Yes.

25,468. And when are they best?—Now.

25,469. Are they best just when it is about time for you to stop fishing for them?—Yes. During this month and next the oysters we get are as good as they are at any time of the year.

25,470. Have you ever fished for them in the month of May?—Yes.

25,471. And have you found them then in good condition?—Yes, as good as at any time.

25,472. Have you taken any up in the month of June?—Yes.

25,473. You are not allowed now to fish for them in the months of May and June?—No; we are prevented from oyster-fishing then, but we think the restriction ought to be taken away.

25,474. Have you ever seen the French fishermen fishing upon the oyster beds during the months of May and June?—No.

25,475. Do they never go out then?—No.

25,476. Then the same regulation applies to their fishing as to yours?—Yes.

25,477. Have you ever seen any foreigners fishing on the fishing grounds except the French? Have you seen any Dutch boats there?—No.

25,478. Have you of late years seen any English boats fishing on the fishing grounds to which you go during the months in which you are prohibited from fishing?—No.

25,479. Have you been there during the months you are not allowed to fish?—Yes.

25,480. And you have seen no boats there?—No; I have not been fishing during the months of May, June, July, and August for the last 10 years.

25,481. You have not been out to the oyster-fishing during the four summer months?—No.

25,482. It has been stated to us that there are fishermen who come from other parts of England where there is no prohibition as to taking the dredges out, and who fish with their boats during the fence months. I want to know if you are aware whether that is the fact or not. Have you ever seen anything of the kind?—Yes, I have seen them.

25,483. What have you seen?—I have seen them at work.

25,484. You have seen them fishing during the fence months?—Yes.

25,485. When?—Last summer.

25,486. Where did the vessels come from that you saw fishing?—They came from Colchester, and they were catching oysters just off Brightlingsea Creek.

25,487. How many vessels were there?—From 50 to 70 altogether.

25,488. Were they fishing on the same ground on which you are in the habit of fishing?—Yes.

25,489. And during the time that you were prohibited from fishing?—Yes.

25,490. Could you not have gone out and have fished as well as they?—We had the same chance to do it as they had.

25,491. But you did not do it?—No. This is our home, and we do not wish to get the oysters when they ought not to be taken. On the contrary we want to get them here.

25,492. Was there any French authority upon the oyster-banks to look after the interests of the fisheries?—Yes.

25,493. Did they interfere with the fishermen who were fishing contrary to the law?—Yes; they took away one vessel that was fishing there.

25,494. Do they cruise on the fishing-banks during the summer when oyster-fishing is not allowed?—Yes, they did that week.

25,495. And you say that one vessel was seized?—Yes, they took one vessel.

25,496. What was the consequence, did the rest stop fishing and go away?—Yes; the rest got their dredges up and got away as they could.

25,497. Did they not go back again?—They went back again the very next week.

25,498. Then they would be quite aware that they were running a risk in continuing, and that they were liable to be taken?—Yes, they knew that well enough.

25,499. Do you know anything of the state of the grounds upon which the oysters are dredged on the fishing-banks?—I know that the cleaner the ground is kept the better the oysters are, and the sooner the spat takes.

25,500. If the spat falls upon clean ground it adheres and lives?—Yes.

25,501. Under other circumstances it dies?—Yes.

25,502. How is the ground kept clean?—By constantly working over it.

25,503. With your dredges?—Yes.

25,504. Can you not over-work it?—I do not think we can.

25,505. Are you able to say whether in the course of your experience there is any part of the Channel, upon which you have been in the habit of fishing, which has been over-worked, and has in consequence fallen off in the yield of oysters?—No, I think not.

25,506. Do you know anything about the Jersey beds?—No; but I believe there are no oyster beds there now worth speaking of. The Jersey oysters are all caught and lost; that is the reason why the Jerseymen have come to fish upon the grounds where we go.

25,507. You cannot of your own experience tell us anything of the Jersey oyster beds?—No.

25,508. Have you not been there?—No.

25,509. You say that the ground ought to be kept clean?—Yes.

25,510. The object of that is to increase the supply of oysters on the beds?—Yes.

25,511. Can you tell us that from any experience of your own?—If the spat falls upon dirty ground of course it will not live.

25,512. How does the ground get dirty?—The dirt settles down from the water; it settles upon the bottom.

25,513. Do you think that it would increase the supply of oysters if you were allowed to dredge on the beds during what are called the fence months?—Yes.

25,514. Would you suggest that dredging should go on during the whole of the fence months?—No; only for two out of the four months.

25,515. Do you mean May and June?—Yes.

25,516. Are you able to say from your own knowledge that the oysters in the deep sea do not spawn earlier than July?—I do not think that they do spawn before then.

25,517. Do you think that they spawn earlier in shallow water?—Perhaps they may in shallow water, but I have been speaking of the deep-sea oysters.

25,518. Have you ever observed, from the state of the oysters when they have been caught in the month of June, that they are not likely to spawn until July?—I have never seen any that were in a condition to spawn before July.

25,519. Have you never caught any in June that had spawn in them, and were ready for spawning?—No.

25,520. You say that when you catch them at the commencement of the open season, in the month of September, they are in poor condition?—Yes.

25,521. Do you agree with the previous witnesses, that it would be an advantage to you, and also to the French fishermen, if the month of May were made an

SHOREHAM.
S. Allen.
7 May 1864.

open month, and the month of September were made a fence month?—Yes; I think that would do us a great deal of good.

25,522. You think it would be an advantage to everybody concerned in the oyster-fishing?—Yes.

25,523. To the French fishermen as well as to the English?—Yes.

25,524. Have you ever taken your boat into a French port?—I have been in a French port.

25,525. Have you ever sold your oysters in a French port?—Yes.

25,526. Have you been at Dieppe?—Yes.

25,527. Have you sold oysters there?—No.

25,528. Could you not have sold them there?—No.

25,529. Would the French law have prevented you?—Yes.

25,530. Would it be of advantage to you as a fisherman to be able to go into the French ports and sell your oysters there?—Yes; I think it would.

25,531. Would it be of advantage to you if the French fishermen were allowed to come here and sell their oysters, and you were permitted to go into French ports and sell yours there?—Yes; I should not object to that.

25,532. You think it would be of advantage to you?—Yes.

25,533. As an English fisherman you think you would be all the better for such a change being made?—Yes.

25,534. Do you sell any of your oysters to the French oyster merchants?—No, I never have done so.

25,535. Do you find that any of the French oyster merchants come here to buy oysters?—Yes.

25,536. Have they bought them of any of your neighbours who are fishermen?—I believe they have at Newhaven, but not at Shoreham.

25,537. Is it not the case that the demand for oysters in France has increased the price of oysters here?—Yes, I believe it has.

25,538. Is it not the case that the increased price you are now able to obtain for your oysters has arisen in consequence of the French oyster merchants giving you a higher price here?—I have no doubt that the reason we have been able to get more money for our oysters is that the Frenchmen have been in the market for them.

25,539. Do you know what the Frenchmen do with the oysters when they take them, do they lay them down on beds the same as you do here?—Yes, I believe they do.

25,540. They are never taken to the market direct, any more than they are here?—No; they lay them down on beds.

25,541. Are the oysters when you catch them in the deep sea unfit to be sent at once to the market?—Yes.

25,542. They are not fit to be sent to the market for consumption until after they have been laid down upon the beds for a short time?—No; they require to be laid down upon the beds first.

25,543. What change takes place in them after they have been laid down on the beds?—The laying of them down cleans them I believe.

25,544. Is that always done when the oysters are brought in here?—Yes.

25,545. You never sell your oysters to go into the market direct?—No.

25,546. (*Professor Huxley.*) Do you find a ready sale for the oysters you bring in here in the month of September?—Yes.

25,547. You can sell them all, as many as you can bring in?—Yes.

25,548. Notwithstanding the fact that at that time they are out of condition?—Yes; we can always find a sale for them.

25,549. Do you get as good a price for them then?—No; they never bring as much when we first commence catching them.

25,550. What difference is there in the price then as compared with the price you get later on in the season?—About a shilling a tub.

25,551. When you speak of their being out of condition do you mean that they have not got into good order after spawning?—Yes.

25,552. How do you know that the oysters in May or June are not spawning?—I never saw any that were spawning then.

25,553. Have you opened them yourself at that time?—Yes.

25,554. Are you in the habit of eating many of them?—I have opened some sometimes, but I never found any that were spawning.

25,555. Could you get as good a price for oysters here in May and June as you could at any other period of the year?—Yes.

25,556. The oyster merchants would not give you a less price for them?—No.

25,557. Have you any notion of what takes place when the oysters are spawning?—No.

25,558. Have you ever seen the spawn in the inside of the shell when you have opened an oyster?—I have seen the oysters what we call "sick" when I have been opening them.

25,559. At what time of the year has that occurred?—Generally in the height of the summer, in the hottest part of the weather.

25,560. Did you ever notice the spat when it was young?—Yes, on the shells.

25,561. But not swimming about in the water?—I have never seen that to know it.

25,562. Have you ever heard of that being the case; have you heard anything said about the spat rising to the surface after it is exuded from the shell?—I have heard people talk about it, but I never saw it.

25,563. How many men are there in the crew of your boat?—Six, five besides myself.

25,564. That is the master and five men?—Yes.

25,565. How do you arrange with regard to the profit of the boats, do the men receive wages?—We do not pay wages, the men go by shares.

25,566. How do you arrange the shares?—There are eight shares in all.

25,567. How are they divided?—The vessel takes two shares, and there is a share for each of the men who go with the boat.

25,568. What does the master of the boat get?—Only a share like the other men.

25,569. He only shares with the rest?—Yes.

25,570. He gets nothing extra on account of having the management of the boat?—No, the shares are all equal.

25,571. Do you work with one dredge down at a time?—We work with four dredges; we keep heaving them up and then putting them overboard again.

25,572. You have altogether four dredges?—Yes.

25,573. Where do you heave them out, on the two quarters?—One at the stern and one at the bow.

25,574. Then you work two at the stern and two at the bow?—Yes.

25,575. Do you work them both on the weather and on the lee side?—No, they are both heaved overboard to windward if we can get them there.

25,576. At what sort of rate do you go when you are dredging?—Never very fast.

25,577. Can you do two knots?—No.

25,578. Not so much?—No, we do not want to do as much as that.

25,579. Is one knot enough for you?—Yes.

25,580. Do you haul the dredges up in turns one after the other?—Yes.

25,581. Does it take as much time to get one clean as it takes to get another up?—Yes.

25,582. Do you have a capstan to haul the dredge up with?—No, we use a winch.

25,583. How long does it take to take up a dredge?—Sometimes it takes about 20 minutes.

25,584. What is the depth of water in which you dredge?—About 22 or 23 fathoms and sometimes 24.

25,585. If you get foul with a dredge of the size you generally use I presume that you carry away

your ropes?—We carry away the hoop and lose the dredge; sometimes we bring up.

25,586. How many dredges do you expect to lose in the course of a season?—That all depends upon whether we get caught fast or not. We can never tell when that is going to happen. We have lost four this season; some have lost more and some have lost less.

25,587. Then the loss you sustain in that way does not add a very great item to your expenses?—No.

25,588. The cost of a dredge here is 25*s*. I believe?—Yes, about that.

25,589. Does the smack generally belong to an owner ashore or to the men who fish with it?—Generally to an owner ashore.

25,590. Then he takes two shares, I suppose, as payment for the use of her?—Yes.

25,591. Do you work with the tide or under sail?—With the tide and under sail too.

25,592. Will there be enough tide for you out where you are in the habit of fishing?—Yes, and very often too much.

25,593. You have very strong tides towards the southward?—Yes, the spring tides are very heavy.

25,594–5. Do you ever work against the tide?—No.

25,596. Do you work with the tide for one six hours?—Yes.

25,597. How much ground will you cover in that time, a good many miles, I suppose?—Yes, but I have taken no account of the space we cover.

25,598. Perhaps six or seven miles?—Not as much as that.

25,599. Do you work up to the next tide?—Yes, and then come back again to the next tide.

25,600. Are you careful to pick your oysters and throw the small ones overboard?—Yes; it would be of no use to bring the small ones here. We want nothing but what is fit for the market.

25,601. The oysters which you consider fit for the market are large ones?—Yes.

25,602. Have you any notion how long it takes for an oyster to grow until it becomes fit for the market?—No.

25,603. What is the common opinion about it?—It takes about four years I believe. When you first see the spawn it is like a tallow-drop.

25,604. (*Mr. Caird.*) Are you aware that it is forbidden to dredge for oysters between sunset and sunrise?—No.

25,605. Was there never any authority here that enforced such a restriction as that upon you?—No.

25,606. Has no one ever given you any information that that is the state of the law?—No.

25,607. Would it be very injurious to you as fishermen to have such a restriction enforced?—It would be a very bad law, I think, if it was carried out in regard to the fishing in the Channel.

25,608. You consider that it would be very injurious to you?—Yes.

25,609. Do you fish night and day as the weather suits you?—Yes, and sometimes even then we do not get a day and night's work in the course of a week.

25,610. Then it would be a great hardship to you if you were obliged to take up your dredges at sunset?—Yes, we don't want to be compelled to do that.

25,611. You are aware that there is such a regulation?—Yes.

25,612. And suppose it were enforced and you were obliged at sunset to haul up your dredges, would you not be obliged to come ashore or to lay-to all night?—Yes.

25,613. You would therefore lose your time?—Yes.

25,614. What possible benefit could arise from the enforcement of that prohibition against fishing after sunset?—I do not know. As it is we can only fish now and then in the Channel.

25,615. It does you good to be allowed to fish both night and day?—Yes; I believe that those regulations are intended to apply only to the inshore fishers. They are supposed to begin at sunrise and to leave off at sunset.

25,616. The inshore fishers?—Yes.

25,617. But I take it to be a rule that applies equally to all oyster fishers?—Yes, but ours is a very different kind of fishing. That is a regulation intended to apply to fishermen who were engaged in a different description of oyster-fishing before the deep-sea Channel fisheries were found out at all.

25,618. (*Professor Huxley.*) Are you obliged to carry any particular light?—Yes.

25,619. You are always practically at anchor?—We always light up at night.

25,620. When you are dredging you are practically as good as anchored?—Yes, and we always have a bright light then.

25,621. Where do you hoist it?—On a ring.

25,622. At your mizen?—Six or seven feet above the deck.

25,623. On a post of its own?—No, on the vessel's rigging.

25,624. In any particular place?—No.

25,625. You have no particular regulation with regard to that?—No.

25,626. How long have you been engaged in fishing on the deep-sea beds?—About 13 years.

25,627. Is that as long as they have been known?—No, not quite.

25,628. How long have they been known?—About 17 years.

25,629. Were they known as far back as the year 1839 or 1840?—No, I think not.

25,630. Have they fished in this part all along within that time?—I do not know. That is before my time.

25,631. (*Mr. Caird.*) Are you aware whether the French oyster merchants sometimes meet the oyster boats at sea and buy the fish before they are landed at all?—I do not know of that.

25,632. You have never seen it?—No.

25,633. Can you tell us at all what extent of ground in miles these Channel oyster beds cover?—No, but they extend from Cherbourg up to Dunkirk and all over in different places.

The witness withdrew.

JAMES HEDGETHORN called and examined. *J. Hedgethorn.*

25,634. (*Mr. Caird.*) You are an oyster merchant here I believe?—Yes.

25,635. Have you also been practically engaged in the oyster-fishing?—Yes, ever since I was nine years old.

25,636. Have you been in the habit of fishing on the Channel oyster beds?—Yes; but I have not been in the Channel fishing for some years. I have only been connected with the oyster beds here as an oyster merchant.

25,637. Have you been engaged in fishing upon the oyster beds where the deep-sea oysters are caught?—I was fishing in the deep sea for oysters 35 years ago off Beachy Head.

25,638. Are they the same beds which are now being fished?—Yes, I have no doubt of it.

25,639. Are the beds yielding as many oysters now as they did at the time of which you speak, namely, 35 years ago?—We could get plenty of oysters 35 years ago. I have gone for one whole tide over a distance of 15 or 20 miles, driving the whole tide with a dredge full of oysters off Beachy Head.

25,640. Then do you think that there was a more plentiful supply of oysters then than there is now?—I do not say that. We could always get our dredge full then, and I believe they can do the same now.

25,641. Then the supply now is about the same as it was at the time of which you speak?—Yes, pretty much about the same.

SHOREHAM.

J. Hedgethorn.

7 May 1864.

25,642. Are you able to tell us over what extent of the Channel the deep-sea oyster beds are to be found?—They cover a very wide extent. I can hardly give you any limit. I have known the people go out from here when I was here 12 or 14 years ago in great numbers. There would be 60 or 70 sail lying in this harbour at one time, and when they went out to the oyster-fishing I question very much whether they would see one another so as to know each other until they came back again from the fishing.

25,643. Do you mean by that that after they leave the harbour they spread about so much?—Yes.

25,644. What distance will they cover?—I can hardly tell you.

25,645. Can you not give a rough guess? Will it be 20 or 30 miles?—Yes, and more than that; many of the fishing boats will be 30 or 40 miles apart.

25,646. You are speaking now of 12 or 15 years ago?—Yes.

25,647. Does the same thing occur now?—Yes, new oyster beds are being constantly found.

25,648. New beds are frequently found in the Channel?—Yes. Only this last year there were oyster beds found in the Channel which were not known before.

25,649. Are you able to say from your own knowledge and experience that the supply of oysters in the Channel is increasing?—Yes, there are more oysters to be found in different places now than ever we knew of before. At one time there was only one place to go to for catching oysters, but now they go all over the Channel. The boats that are out fishing can get oysters in sight of the French land and in sight of the English land too. They are all over the Channel.

25,650. Do the French and English boats fish together?—Yes, sometimes.

25,651. Do the French and English boats fish indiscriminately all over the Channel?—I believe that the French fishermen keep more to their own side than the English do.

25,652. Do you know whether the number of boats fishing from this place has much increased of late years?—No, I think not.

25,653. Has there been any decrease in the number of boats?—More boats were in the habit of using this harbour 14 or 15 years ago than we have now. There has, however, been a considerable increase lately.

25,654. What is that owing to?—To the Jersey fishermen.

25,655. Do the Jersey boats come here?—Yes; the fact that the Jersey oyster grounds have been lying dormant for the last few years has caused the whole of the Jersey fleet to come here, and we get so many of their boats now that perhaps altogether there are rather more boats that come here now than did before.

25,656. Do you know anything of the Jersey fishing?—Yes, I have been there often. I have been acquainted with the Jersey fishing, in fact, all my life.

25,657. I understood you to say that the Jersey grounds are lying dormant?—Yes.

25,658. What is the cause of that?—I believe it is owing to the regulations which have been put upon the fishing.

25,659. Do you think that the law which is enforced there for the regulation of the oyster fisheries has worked injuriously?—Yes. I think if the French people were to allow the English vessels to dredge at Jersey for so many months in the year, and were simply to see that they threw overboard all the small oysters they took up in their dredges, there would always be plenty of oysters, and so there would be everywhere else if that was done.

25,660. What in your opinion is the mode in which the fisheries have been injured?—I think myself that the Kentish companies who go there do a great deal of harm. They go there and buy the brood at 2*s.* 6*d.* and 5*s.* a tub. They will take anything. They buy them as small as the fishermen can get them.

25,661. What do they do with those small oysters?—They carry them away to their own place.

25,662. Do they lay them down on beds of their own?—Yes, they carry them away and lay them down on private grounds in August and September.

25,663. Do they improve upon those grounds?—Yes, they grow there and remain until they are ready to be taken to the market.

25,664. Then it is not from any restrictions with regard to setting apart certain months as fence months that the falling off has taken place?—No.

25,665. Have there been any new restrictions enforced with regard to the Jersey oyster beds?—No.

25,666. What falling off has really taken place there?—In my opinion the falling off has taken place in consequence of the ground not being so well cultivated as it ought to be.

25,667. I am not asking why. How many years back is it since there was a good fishing at Jersey?—About seven years ago I took 20,000 bushels of oysters there and sent them over to England.

25,668. Did you take that quantity yourself?—Yes.

25,669. Then seven years ago there were plenty of oysters there?—Yes, but there are very few there now. Seven years ago we could get a dredge full of oysters there at any time.

25,670. There are not plenty to be found there now?—No; there are not many there now, and the grounds will all be lost if something is not done to re-establish them. I have no doubt myself that if the grounds there had been worked as they ought to be there would have been plenty of oysters now, and the ground itself would be more likely to take the spat than it is now.

25,671. Why would the ground be more likely to take the spat?—When the ground is clean the spat has a much better chance than when it is dirty. If the spat falls on a clean piece of shell it will live. The spat will readily adhere to anything if the ground is only clean. In Harwich Harbour I have found five or six spat on an old bottle or a piece of an old hat, or anything.

25,672. The spat has a much better chance of living if the ground is kept clean?—Of course. If it falls on anything clean it would set, but if it falls on a filthy dirty piece of ground there is no doubt that it will very soon die.

25,673. What is it that makes the ground filthy or dirty?—It soon gets dirty if it is not worked.

25,674. Does it require to be dredged over backwards and forwards in order to keep it clean?—Yes.

25,675. And if it is kept clean in that way the spat lives?—Yes; when the spawn falls upon clean ground it lives.

25,676. Are you aware of any restriction being enforced in regard to the oyster beds on the coast of Jersey which has prevented the ground from being kept clean?—Yes.

25,677. What is it?—In former years we were allowed to work constantly all over the ground. Then after that, three or four laws were passed and we were prevented from working. The consequence has been that the beds have been nearly all destroyed, and the Jersey fishermen are obliged to go somewhere else.

25,678. Do you know whether the laws of Jersey are different from those which are enforced in regard to the oyster fisheries in the Channel?—Yes, I think they are in some things.

25,679. In what respect do they differ?—There is one matter of which the fishermen often complain.

25,680. What is it?—That the fishing vessels should be required to bring up in the night-time; I never saw that done except in Jersey.

25,681. Do you mean that the oyster boats are not allowed to dredge in the night-time?—Yes; a French steamer is sent out to protect the oyster ground, and an English steamer is also sent out from Portsmouth to protect the fisheries. As soon as it is sundown it is the duty of the commander of the steamboat to fire a gun. When that has been done they make all the fishermen leave off fishing. If the boats hoist a flag the steamer takes them into the harbour for safety

in case it might come on to blow fresh. If it comes on a gale of wind they are afraid that they may be driven too near the French coast and be obliged to interfere with the French limits.

25,682. They take the boats into harbour in order to prevent them from going within the French limits?—Yes.

25,683. Has the result of recent interference ir Jersey been to drive the Jersey oyster fishermen away from the beds upon which they have been in the habit of fishing into the deep-sea fisheries in the Channel?—Yes; but there may have been other reasons as well. When these oyster beds in the Channel were found out 15 or 16 years ago, the people fishing from Jersey were induced to leave their own place and come here. A great number of them came to Shoreham Harbour, to Bosham, and to other places down our coast close at hand.

25,684. What was the cause of that?—Being so near the railway they probably thought that they could get the oysters into the London market cheaper than upon any other part of the Kent or Sussex coast.

25,685. Then one reason why the Jerseymen have ceased to fish on their own beds is that they can find a better market with more rapid and cheaper communication by coming here?—Perhaps so; but the Jersey grounds have now been lost altogether. They are not properly worked, and the spawn instead of falling upon clean ground and living is entirely lost. It cannot be expected that oysters will live on that ground or on any other dirty ground. There would be plenty of oysters there again if the ground was properly cleaned.

25,686. Is the supply of oysters which you obtain from the Channel oyster beds increasing very much?—We have never found any lack of oysters there; but the fishermen have been constantly finding out different beds in different places.

25,687. Have you found that in any particular place where you have long been in the habit of fishing the beds have become exhausted in consequence of over-fishing?—There are not so many oysters as there were on some of the beds when we first went to them. But you cannot expect it to be otherwise, as there have been no small oysters to take the place of the large ones which have been removed. If there comes a spat in the Channel there will be as many as there ever were.

25,688. Is there any complaint that you wish to make to us with regard to the mode in which the oyster fisheries here are regulated beyond what you have already stated?—No.

25,689. Have you any observation you wish to make upon any point in which you think your power of catching oysters is restricted or impeded?—I think myself, and I believe that all the people in Shoreham connected with the oyster-fishing agree with me, that there should be another month or perhaps two added to the open fishing, and taken away from the time when we are not allowed to fish. All of us who have been brought up to the oyster fishery are ready to prove that the oysters are better in the months of May and June and sometimes in July than they are at any other time of the year. The oysters we catch are not like those which they get at Harwich or Falmouth. Ours are caught in from 18 to 20 fathoms of water, and they never spawn until the months of August and September. We are allowed to take them in September, and that is just the time when we ought not to be allowed to go after them, as they have only just spawned and are in very bad condition; in fact they are in a worse condition in the month of September than they are at any other time.

25,690. Then you would rather lose the month of September if you could get the months of May and June?—Yes, for my own part I would hold up both hands for that.

25,691. You think that would be an improvement?—Yes, I have no doubt it would.

25,692. And that it would be of advantage to the interests both of the French and of the English fishermen?—The French people are in a very different position from us. They have not got a body of fishermen like ours. All they have is a lot of people who have been accustomed to go to this fishery part of their time, but they have no class of fishermen like we have regularly engaged in oyster catching. Many of our men come from Kent and Essex and have served a seven years' apprenticeship to it. We do not know anything else; we are regular oyster-fishermen. We have been brought up to that and nothing else.

25,693. Do not the French fishermen in large numbers go to the oyster beds in the Channel?—Yes, no doubt they do, but they do not confine themselves to that. They are not regular oyster-catchers like we are. They can go with their boats to Newfoundland, fish with the trawl if they choose, or they can go out mackerel-catching and herring-catching.

25,694. They are not confined to the oyster fisheries alone?—No.

25,695. But at the same time they do go oyster-fishing?—Yes.

25,696. And in large numbers?—There are a good many of them sometimes. I have seen them in great numbers when I have been at Jersey.

25,697. And they follow the oyster-fishing in the same way that you do?—No, not altogether in the same way that we do.

25,698. In what respect is there a difference?—I do not know what they do now, but in former years, when I was better acquainted with the fishing, they used to haul everything they got in the dredge on board and carry it in to Granville. There they would discharge it, and heave overboard all that was of no use to them. We never did that.

25,699. In what way did you conduct your fishing?—We used to cull the oysters on the beds when we were at Jersey, and we threw over everything that was not fit to carry away.

25,700. You did that at Jersey?—Yes.

25,701. Did you do the same thing on the Channel beds?—Yes.

25,702. Do the French fishermen also do so on the Channel beds?—I daresay they do upon the Channel beds, but they did not when they were fishing on the beds at Jersey.

25,703. Have you fished on the Channel beds where the boats from this place go now?—No, I have not been fishing on the deep-sea Channel beds except 35 years ago off Beachy Head, but I have fished for a considerable time at Jersey.

25,704. Is there any other point which you wish to bring under our notice?—I think I have said pretty nearly everything that is necessary. I may tell you, however, that if you gentlemen wish to make any alterations with regard to the way in which the oyster beds are to be worked, you ought to compel all the fishermen to confine themselves to a certain size.

25,705. Do you mean that they should be restricted from taking oysters under a certain size?—Yes, I would never mind how large you made it, but I think you ought to confine the fishermen to a particular cull or size. They should take all above that size, and I would never mind whether they took a spat-shell or not.

25,706. You would not allow the small oysters to be carried away at all?—No, and why I say this is because I know that in the Mersey, on the Essex coast, the Colne, the Crouch, and the River Blackwater as much as 100,000 mashes of culch have been taken away from the ground in the course of the year. They have been taken away entirely for the benefit of the Kentish and Essex oyster merchants, who do not care, so long as they can get them, what amount of injury they do to the oyster beds. In Falmouth I have been told that the same thing has been going on.

25,707. What sort of regulation do you think ought to be laid down?—All the oyster-boats should be required to cull to a size.

SHOREHAM.

J. Hedgethorn.

7 May 1864.

25,708. You would require that no oyster below a certain size should be brought ashore?—Yes, they should not be allowed to be brought ashore anywhere. The commons should all be of a certain size, and likewise the natives.

25,709. But that is exactly what the law says at present?—Then it is not followed.

25,710. This Act of Parliament says:—The fishermen shall cull the oysters on the fishing-ground, and shall immediately throw back into the sea all oysters less than two and a half inches in the greatest diameter of the shell, and also all sand, gravel, and fragments of shells."

25,711. Do you ask that that law shall be enforced?—I should very much like it for one.

25,712. Do you think that if that particular article of the law were strictly enforced it would be of more advantage to the oyster-fishing than the restriction with regard to the fence months?—Yes, and it would be of more benefit to the working classes of the people.

25,713. Is the size $2\frac{1}{2}$ inches the size you require?—I think $2\frac{1}{2}$ inches would be a very good size for commons, but with regard to natives it would be necessary to come down to an inch or an inch and a quarter.

25,714. Do they get any natives in the deep-sea Channel fishery?—No, only on the private grounds in Maldon River, the Blackwater River, Harwich, Whitstable, and such places.

25,715. They are kept on private grounds?—No, it is all common ground.

25,716. Are the natives kept on common ground?—Yes.

25,717. Are they not laid down upon private property?—It is private property where they are hoarded up, but they are also upon common ground.

25,718. Is there much injury done to the brood of oysters on the common ground by fishing them below the size which you desire?—It is much destroyed, I think.

25,719. You think it is much destroyed there?—I am certain that it is, and I can prove it if necessary.

25,720. But with regard to the deep-sea fishery, you think that if the oysters were prevented from being taken below a size of $2\frac{1}{2}$ inches that would be enough?—Yes, from 2 to $2\frac{1}{2}$ inches would be quite small enough.

25,721. (*Professor Huxley.*) Did you ever see the oyster spawn swimming on the surface of the water?—No.

25,722. Did you ever hear of it?—We know when it is swimming. I have seen hundreds on a shell like tallow-drops.

25,722*a*. Have you ever heard it stated that oyster spawn rises to the surface?—Yes, but I do not think that any man in the world ever knew anything about it.

25,723. Do you think that it is all fancy?—Yes.

25,724. Have you ever seen oyster spawn in the deep water earlier than July?—No; I have been at it all my lifetime, and I have worked all the year round, and I never saw oysters come before July or August, and then they are good for nothing; they are all water, and fit for nothing.

25,725. Are they in spawn in September?—You might catch a few in spawn then, but they are principally in spawn in the latter part of July and the beginning of August.

25,726. Are you allowed to go within the three-mile limit on the French coast?—It is five miles I think from headland to headland on the Jersey ground.

25,727. Do they keep you from coming within that limit?—Yes, they did so when they could, but we have been there a good many times—a good many hundred times when they could not keep us out.

25,728. How was it that they could not keep you out?—They had a cutter, but the cutter used to go away and then we went to work. When they came out again it would be daylight in the morning.

25,729. Would you have any objection to allow the French fishermen to come over here within three miles of the coast?—Not if they allowed us to go there within three miles of their coast.

25,730. Would there be any objection to allow the French fishermen to come here to sell their fish if you were allowed to go there?—I think not. I don't think it would make a bit of difference.

25,731. You would rather have free trade?—Yes; there is only one thing that we do not think is right.

25,732. What is that?—That the Jersey freighters should be able to take oysters out of our vessels and carry them into France when we are not allowed to do so.

25,733. Jersey freighters?—Yes.

25,734. Will you explain what you mean by that? You say that fishermen come out of Jersey and take oysters from your vessels which they carry into France?—Yes; they pretend to have a claim or right to do that. They put their dredges on board of other vessels and then go in as a coaster.

25,735. Do they go in as a French coaster?—No, as an English coaster. They get a clearance, and a form which they fill up themselves, and they go in as coasters from the Channel. They have gone into France in that way hundreds of times during the present year.

25,736. If an English vessel is not known to be a fishing vessel can she go in?—Yes, they are freighters; but our vessels do not go in there as Jersey vessels.

25,737. Do they make a distinction between the Jersey vessels and yours?—Yes, they work against us; that is what we complain of. If there is to be free trade, let it be proper free trade. We want the merchants who come into the harbours of Newhaven, or Shoreham, or Portsmouth, to be in the same position that we are in ourselves.

25,738. Do you mean to say that any Jersey vessel can go into the harbours of France and be dealt with as a French vessel?—They say that the Jersey vessels have that privilege, and that they can do all that the French vessels can.

25,739. You do not think that that is fair?—No, I do not. If we are to have free trade, let us have it. Let us all be placed on the same footing.

25,740. Are there more oysters on the French coast than on the English coast?—I have no doubt that there are plenty there, but we are not allowed to go after them, and the French themselves will not take the trouble to do so.

25,741. Why do not the French come into the deep Channel after oysters in as large numbers as the English?—Because they are not brought up to it as we are; they know nothing about it. There are several here in the room now who by looking at the shell of an oyster would be able to tell you where it came from, and almost from what part of the fishing grounds it was taken. There are several here now who have been brought up to oyster-catching all their lifetime.

25,742. (*Mr. Caird.*) Is there any particular part of the Channel oyster beds which the French are more anxious to protect than others?—If they could get more upon their own coast, they would like it best; but as the beds nearer their own country have been done away with, they like to come here, the same as we would like to go there, if there were plenty of oysters to be got there, and none here.

25,743-4. Have you ever fished to the westward of Cherbourg?—I have been at Jersey, and I have fished off the French coast at Cherbourg. I have known vessels which used to leave Jersey Harbour 30 years ago and fish off Cherbourg breakwater. In a very short time they would get their vessels full, and then they would bring them into Jersey.

25,745. Would you have no complaint to make against the Convention if you were permitted to fish

SHOREHAM.

J. Hedgethorn.

7 May 1864.

outside a line drawn 15 miles from the French coast?—I do not know why I should complain if I were prevented from fishing within 15 miles of the French coast, so long as they were not allowed to come within 15 miles of our coast. But we would rather have the line five or six miles than 15.

25,746. Are the beds upon which you fish now in the Channel within 15 miles of the French coast?—Yes; very frequently we are fishing more than 20 or 30 miles off the French coast. We are as far off as that during the best part of the year. We are generally about midway—half way athwart the Channel, taking the general run.

25,747. There is a memorial here from the inhabitants of Shoreham to the Board of Trade in which they say:—"We would venture to propose to be "restricted to that part of the English Channel lying to "the eastward of a line drawn from Cherbourg to the "Isle of Wight, which would exclude and protect the "beds of the Channel Islands about which the French "authorities are so solicitous." Are you aware whether there are any particular oyster beds in the neighbourhood of the Channel Islands for the protection of which the French are very anxious?—No, I never heard that there were.

25,748. Nor anywhere in the Channel?—No.

25,749. If a line were drawn from Cherbourg to the Isle of Wight, and you were allowed to fish to the eastward of that, would it satisfy you?—A line drawn from Cherbourg to the Isle of Wight. I hardly understand the question.

25,750. If you were allowed to fish to the east of a line drawn between those points, would you then think that all cause of complaint would have been removed?—I think that would be quite sufficient. I do not think our fishermen would care anything about having a line drawn from Cherbourg to the Isle of Wight, if they could fish without being interfered with within that.

25,751. Do you seldom go to the westward of a line drawn between those two points?—I do not think that many of our boats go westward of a line drawn from Cherbourg to the Isle of Wight. It is only boats which go down to Falmouth and to other places on that coast which go to the westward of that.

The witness withdrew.

H. Tyler.

HENRY TYLER called and examined.

25,752. (*Mr. Caird.*) Are you an oyster fisherman here?—Yes.

25,753. Have you been long accustomed to that business?—I have been at it now for nine years.

25,754. What is the size of the boat that you fish in?—It is about 36 tons I think.

25,755. How many men does it take to man it?—Six altogether, a captain and five men.

25,756. Are you in the habit of fishing in the deep-sea Channel fishery?—Yes, I have never fished anywhere else.

25,757. When do you begin oyster-fishing, in the month of September?—Yes.

25,758. And do you continue fishing until the end of the month of April?—Yes.

25,759. Then you are fishing altogether for about eight months in the year?—Yes.

25,760. Have you ever fished at all during the fence months?—No.

25,761. Have you been on the grounds during the fence months?—Yes.

25,762. Have you ever seen anybody fishing on the grounds during the fence months?—Yes.

25,763. Fishing vessels?—Yes.

25,764. What vessels were they?—They were the east country boats, the Brightlingsea boats.

25,765. Do they frequent the fishing grounds in the fence months, when you are not allowed to go oyster-fishing?—Yes, a great part of them do.

25,766. Have you seen a large number of them fishing there in the fence months?—I have seen about 10 of them fishing on those grounds at one time.

25,767. Were there any French boats there at the same time?—I never saw any French boats there oyster-fishing at that time. I have seen French boats fishing there, but I do not know whether they were dredging for oysters, or fishing in the ordinary way. There are trawlers there constantly; they go trawling upon those grounds.

25,768. In the open months, when you are permitted to go out oyster-fishing, do you meet many French boats on the same ground dredging for oysters?—Yes.

25,769. Is there a large number of French boats engaged in oyster-fishing?—Yes.

25,770. Do they fish in the same way that you do?—They fish very much in the same way, but they have different gear.

25,771. In what way is their gear different?—Their dredges are bigger than ours, but some of them are just the same.

25,772. Is there any French Revenue or other vessel employed to look after the mode in which the fishing is carried on by the French boats?—I never saw any.

25,773. Is there no kind of authority, either English or French, upon the fishing ground to see whether the fishing is carried on in a proper manner?—No.

25,774. Then nobody interferes with your fishing in any way during the open part of the season?—No.

25,775. Is it within your knowledge that the French boats throw over the small oysters in the same way that you do? Do they throw them back again into the sea uninjured?—Yes, I think they do.

25,776. Do your fishing boats always do so?—Yes.

25,777. You do not bring any small oysters in with you?—No, they would be of no use to us; we could get nothing for them if we did.

25,778. Have you any gauge by which you test the size of the oysters?—No.

25,779. Then do you merely pick them over by hand?—Yes.

25,780. Do you throw the small ones overboard again?—Yes, but we do not often get many small ones.

25,781. What time in your opinion are the oysters in the best condition?—They are good about this month; they are generally very good now.

25,782. Are they good in September?—No; that is the month when we begin our fishing, and they are hardly worth catching then.

25,783. Then do you agree with the previous witnesses that it would be an advantage to alter the months that are now set apart for fence months?—Yes.

25,784. You would take away the first month of the open fishing, and add to the last month of the open fishing the first month now set apart as a fence month, namely the month of May?—Yes.

25,785. In point of fact you would make September a fence month, and May an open month?—Yes; and in that case I as an oyster-fisherman would be able to earn more money than I can now.

25,786. Would it be an advantage to the fishery generally?—Yes, I think it would.

25,787. It would not in any way be destructive to the fishery?—No.

25,788. You do not think that it would be followed by any destruction of the spawn?—No, I think not.

25,789. Do you think from your own knowledge that the oysters in the deep sea do not spawn in the month of May?—Yes, they do not spawn then.

25,790. Have you any evidence of that; what makes you come to that conclusion?—I have seen no spawn in that month. Later on I have sometimes seen a little spat on a dead oyster shell.

25,791. (*Professor Huxley.*) In what month have you seen that?—In the month when we first begin oyster-fishing.

SHOREHAM.

H. Tyler.

7 May 1864.

25,792. That is in the month of September?—Yes, in September.

25,793. Have you ever seen any in May?—No.

25,794. (*Mr. Caird.*) Are you aware, from your own experience as a fisherman, that any particular oyster beds in the Channel have been exhausted in consequence of having been over-fished?—No; but we have not caught a wonderful many fish this year.

25,795. How is that?—Because we have had bad weather, and we have not been able to do much at it.

25,796. That is another matter altogether, that has nothing to do with over-fishing the beds?—No.

25,797. If the weather had been good you could have gone on fishing the same as usual?—Yes.

25,798. And if you had been fishing there do you think there are as many fish there to catch now as there have been in other years?—Yes.

25,799. Do you find that there are as many boats now from all quarters coming to fish upon the grounds as there ever were?—Yes.

25,800. Are there more boats engaged in the Channel oyster fishery now than there were some years ago?—Yes.

25,801. Do you think that every one of them are making as good a catch as a boat used to make in former years?—I do not see that there is much difference.

25,802. Then there must be a large increase in the whole quantity caught compared with what was caught in former years?—Yes, there must be a very great increase.

25,803. Is there any particular ground that you would avoid now when you go out to fish in the Channel, because you believe it to have been over-fished?—No, I don't know that there is. We fish now in mid-channel, we used to go right over until we could see the French land at one time.

25,804. Do you find that it does not answer your purpose now to go so near the French coast as you did formerly?—Yes; we can get more oysters now by not going so far out for them.

25,805. Is there much difference in the depth of water in the Channel?—No.

25,806. Is there much difference, for instance, in the depth of water in mid-channel, and nearer the French coast?—No, there is not much difference in the depth of water at all; it generally runs from 20 fathoms to 22 fathoms.

25,807. Is the depth on all the Channel oyster beds something like from 20 to 22 fathoms?—Yes, there is not a great deal of difference.

25,808. Is it much harder work to fish in water 20 fathoms deep than to fish in much shallower water?—Yes.

25,809. The deeper you go the more difficult your labour becomes?—Yes, the deeper the water we go in, the more rope we have to give the dredge.

25,810. I think you heard me say to one of the other witnesses that there is an article in the Act of Parliament which forbids oyster-fishing during the night-time, from sunset to sunrise?—Yes.

25,811. But you have never observed that law, have you?—No, I have not.

25,812. Would it be a great hardship upon you if that law were strictly enforced?—Yes, it would be a very great hardship indeed upon us poor fishermen. We should not be able to get a living if we were prevented from taking oysters at night. We should get next to nothing.

25,813. Are you aware of any advantage that would be gained by the fishery if that law were strictly carried out?—No.

25,814. It would take you double the time to catch the same quantity of fish?—Yes.

25,815. Do the oysters remain in a good condition in the boats during the time you are out fishing and until you can come to the land?—Yes.

25,816. Do you never lose them in consequence of their getting spoilt in any way?—No.

25,817. Are you ever in the habit of sending any from your boats direct to the market?—No.

25,818. You always lay them down in the oyster ponds before you send them to market?—Yes.

25,819. Do you know anything of their treatment when they are in the oyster ponds?—Yes.

25,820. Have you watched them there?—Yes.

25,821. Do they spawn there?—No.

25,822. You have never seen them spawn there?—No.

25,823. Not in the summer months?—No.

25,824. (*Professor Huxley.*) What is the kind of ground which you find best adapted for oysters?—The clean ground.

25,825. Such as broken shells and gravel?—Yes.

25,826. Do you ever find weed on good oyster ground?—There is not a great deal of weed there.

25,827. You leave the oyster-fishing in the month of April?—Yes.

25,828. Do you go back in the month of September?—Yes.

25,829. When you go back to the fishing grounds in September, do you find that there has been any considerable growth of weed upon the oyster beds?—There is a good deal of weed about then.

25,830. Is there much more then than there was when you left the grounds in the month of April?—I think there is.

25,831. Do you often bring up much in your dredge in the early part of the season?—No.

25,832. Do you bring up more in the earlier months of your fishing than in the later months?—I don't think there is much difference.

25,833. Several witnesses have told us that the operation of dredging tends to keep the ground clean?—Yes.

25,834. That is also your opinion?—Yes, the more we work over the grounds the cleaner they get.

25,835. But I understand you to say that you do not find much difference at the end of the dredging season compared with the beginning?—I understood you to ask me only as to the beginning of the season.

25,836. At the beginning of the season, as a rule, do you find a great deal more weeds on the fishing grounds than you do at the end of the season?—Yes, there are a good deal more then than when we knock off dredging. The more the ground is worked the cleaner it gets.

25,837. When you bring your oysters into port how are they disposed of? Who takes them to the beds?—The oyster merchants.

25,838. Are they unloaded out of your smacks?—Yes, into barges. We get them out in small boats and put them in barges.

25,839. Are they then taken to the oyster beds?—Yes.

25,840–1. Who puts them on the beds?—We have to heave them on to the beds.

25,842. How many men do you employ to do that?—We employ the crew of the smack.

25,843. Is that done at high water?—It all depends upon the time we get in.

25,844. The beds are always covered with water are they not?—Yes.

25,845. They are not laid bare at low water?—Yes, they occasionally are.

25,846–7. Do the beds become high and dry at low water?—Yes.

26,848. Do you lay the oysters down when the beds are covered with water?—Yes.

25,849. Do you take your barge over the beds, and scatter the oysters as you go?—Yes.

25,850. Are there many oysters lost here by the frost in the winter?—Yes, if we have a sharp winter we lose a part of the oysters; the fresh water will come down and kill them.

25,851. But does the frost kill them?—Yes, sometimes; but that depends upon when the oysters are laid down. If we get them laid down two or three weeks before the frost sets in we never lose anything by the frost.

25,852. (*Mr. Caird.*) How is the Convention in regard to the fence months enforced here? Who is there to enforce it?—I do not know.

25,853. Does any authority ever say to you, "You "shall not take your dredge into your boat?"—Yes.

25,854. Has it ever been attempted here?—Yes, once.

25,855. Was that some time ago?—Yes.

25,856. Who interfered with you?—The officers of the Custom House.

25,857. Did they say that you should not go to sea with your dredges?—Yes.

25,858. Did you then desist?—Yes, we stopped then.

25,859. Has anybody since attempted to go out to dredge in the fence months?—Last year we were going out two days before the time, and we were told by the Custom House officers that we could not go to sea.

25,860. Do you mean that you were going out on the 28th of April, two days before the fence months came in force?—Yes.

25,861. They would not allow you to go out on the 28th of April?—No.

25,862. That appears to be rather a straining of the law?—I have been prevented a day before the time. That was done the year before last.

25,863. Then the articles of the Convention are very strictly enforced here?—Yes.

25,864. Have the Shoreham fishermen any other complaint to make except this, that the Convention prevents them from fishing in the month of May?—No.

25,865. The fishermen here are of opinion that if that article of the Convention were not enforced the month of May would be a good month for taking oysters?—Yes.

25,866. That is really the only complaint they have to make?—Yes.

The witness withdrew.

JOHN WELLING called and examined.

J. Welling.

25,867. (*Mr. Caird.*) You are an oyster merchant here, I believe?—Yes.

25,868. Have you long been acquainted with that trade here?—Yes, for the last 14 or 15 years.

25,869. Are you able to say whether the supply of oysters is increasing here?—I do not think it is.

25,870. What is your own knowledge upon the point?—I do not believe that the trade is increasing, and I don't think it is increasing. It would increase I have no doubt, but the fact is that we do not get a sufficient quantity of oysters to take to the market.

25,871. Do you mean that you do not get from the deep sea as many oysters as you require to supply the market?—Yes, we do not get sufficient.

25,872. Do you not find that there are as many oysters got during the open months now as there used to be?—Yes.

25,873. Do you agree with the statements of the other witnesses as to the advantage which you would derive from having the month of May as an open month?—Yes.

25,874. Is the only objection you have to make that you are not allowed to continue to fish during some of the fence months?—That is not all. We have other people in our market now to buy the oysters when they are brought in, as well as ourselves, and that causes us to be short in the supply we require for our own markets.

25,875. Do merchants come here to buy for the foreign markets?—Yes. During the last six or eight months we have had a good many foreign merchants to contend with. They have taken over from 30,000 to 40,000 tubs to France, when perhaps only 15,000 have gone into the English markets.

25,876. Has that quantity of oysters been taken away from this market?—Some of them have gone from here, but they have gone principally from Newhaven.

25,877. Then your complaint is not that a larger supply does not come from the sea, but that you are not able to get as large a supply for the English market?—Yes.

25,878. Are you able to say from your own knowledge that the oyster beds in the Channel have been so much over-fished that the supply of oysters obtained from them has decreased?—No.

25,879. You do not think that that is the case?—No; I believe that there are many different pieces of ground in the Channel which have not been fished upon at all.

25,880. Have you any particular knowledge of the management of the oyster beds and ponds in the harbour?—Yes.

25,881. How many years is it since that system began?—It is about 16 years since it began here.

25,882. Has it gone on increasing ever since?—Yes, it has increased very much.

25,883. Do you not breed any oysters upon those beds?—No.

25,884. Do the oysters never spawn on the beds?—I have seen spawn in the ponds some chance time or so, but it has been very rare.

25,885. Is it not usual for the oysters to spawn on the beds?—No.

25,886. Nor is it encouraged?—No.

25,887. You are not of opinion that that is a system which would answer?—No; in fact we have no oysters here in the spawning time.

25,888. Have the oysters at that time all gone to the market?—Yes.

25,889. When do the beds become exhausted?—That depends on the stock and upon the demand. I have had oysters left here up till the middle of July; but this year I shall not have oysters enough to last out the month of May.

25,890. Have you begun this year with a smaller stock in the fence months than is usually the case?—Yes, and yet I have taken all I could get. I have not refused a tub anywhere during the last eight months.

25,891. Is the demand so good that you cannot keep them?—I cannot get enough to supply the demand.

25,892. Then the result is that they are not kept as long on your beds as they used to be?—They are not as long on the beds now as they were in former years.

25,893. Do they improve in condition after they have remained for some time on the beds?—We do not fancy that they improve much.

25,894. Then why do you put them on beds if they do not improve?—We put them down on the beds in order to preserve them for the market. If we were to keep them in the vessels until we could dispose of them in the market they would die.

25,895. It is of importance to you to feed the market regularly?—Yes.

25,896. And you also try to prevent the market from being over-stocked at any time?—Yes, we send a supply according to the demand.

25,897. Have you lost many oysters on your beds in consequence of the fresh water coming down, or from the frost?—We have not lost many by the frost, but sometimes we lose a good many by the fresh water.

25,898. Is that owing to floods?—It is owing to the river running so far up, and to so much water coming down from the hills in the wet season.

25,899. Does the number destroyed in that way sometimes amount to a large proportion of the whole quantity?—At that time we do not often have a large stock on the ground. The wet season is in the winter months, at the later part of the fall of the year.

25,900. At that time you have not a large stock on the ground?—No.

SHOREHAM.

J. Welby.

7 May 1864.

25,901. When is it that you have a large stock on the ground?—At the close of the season we expect to have a large stock on the ground.

25,902. Is that because the price is better?—No, we keep a stock to supply the market with during the fence months.

25,903. Does the price rise in the fence months?—We anticipate so; but we do not find that it does always.

25,904. What is the fact? Does it rise generally?—We think it rises, and we always anticipate that it will rise.

25,905. I do not ask you what you anticipate, but what you have found to be the fact. Does the price begin to rise after the month of May?—Sometimes it does.

25,906. Do you get more for your oysters during the fence months than you do in the open months?—Yes.

25,907. Then the price does increase in the fence months?—Yes; and of course it costs more to supply the market then, because our labour and our expenses increase.

25,908. Do you find that if you bring in the oysters small and lay them on the beds, that they improve as much as when they are brought in large and in good condition?—We have no small oysters here.

25,909. There are no small ones brought in here at all?—No, we have no demand for small oysters here; nor could we keep small oysters on our beds so as to make them of any advantage to us.

25,910. Can you tell me what quantity of oysters there may be here at the commencement of the fence season?—I cannot tell you that.

25,911. Could that be ascertained?—Perhaps it might.

25,912. It is not of much importance. It is rather a matter of curiosity than anything else. What may be the probable supply in Shoreham altogether?—I can give you no idea of that.

25,913. Are there a great many hundred tons?—Yes, and thousands of tons, too.

25,914. But you cannot put any figure upon the quantity?—No, I will not engage to do that.

25,915. What number of oysters will there be lying on the beds at one time at the beginning of the fence months?—That depends upon the quantity brought in in the open season, and upon the demand.

25,916. Can you give us no idea of the quantity on the grounds at the beginning of the month of May?—No; it all depends upon the quantity brought in in the open season.

25,917. But suppose an average quantity had been brought in during the fishing months, what would be the quantity on the beds at the beginning of the fence months?—I can hardly tell you. We should have to calculate first what value they were per tub.

25,918. You can give us no idea with regard to the quantity?—No.

25,919. Are you able to say what extent of surface your beds cover?—No.

25,920. Do they cover a great many acres?—Yes, they will, if you take all the beds together.

25,921. I am speaking now of all the beds in the harbour?—Yes, they cover a good many acres.

25,922. Is there any payment made to the owners of the soil for the use of the beds?—Yes.

25,923. Who is the owner of the soil?—The Duke of Norfolk.

25,924. Do you lease them?—Yes, we lease them. We have all leases of the grounds we use.

25,925. Do you pay so much for a certain extent?—Yes, and for a certain number of years. We pay so much per year.

25,926. At what rate do you pay for the use of the beds?—Each pays according to the quantity of ground he hires.

25,927. Suppose you take a quarter of an acre, what would you pay?—It is arranged in this way: we have so many ponds, and there is so much paid for each pond. If they average three-halfpence per yard it is calculated what that will be for each pond, and all the beds are taken together in one sum.

25,928. Does it amount to any considerable sum?—The rent is not much, but it costs us a good deal to keep up the beds. The ground requires a great deal to keep it in repair.

25,929. Does the tenant keep it in repair?—Yes, the occupiers have to keep the beds in repair.

25,930. Then the owner of the ground pays nothing for that?—No, he receives his rent after we have made the ground.

25,931. Does the occupier of the ground prepare the beds for the reception of the oysters?—Yes, at the onset we make the beds. The ground was quite level in the first instance. We dug the ponds ourselves and arranged the beds, so that they should always be full at low water.

25,932. Was that done in order that the oysters should always be under water?—Yes, unless we choose to leave them dry. We have sluices by means of which we are able to run all the water out into the river.

25,933. Leaving the oysters dry?—Yes.

25,934. Do you think that it is of advantage to do that sometimes?—Yes.

25,935. Why?—At times we have a good deal of fresh water in, and the water is so thick that you cannot see the oysters. We let off about two-thirds of it and the water then comes clear.

25,936. Do you think that the mud would be injurious to the oysters?—Yes, the foul water comes down the river and runs to the shores, creating a muddy thickness which would be very injurious if it was allowed to remain. We open the sluices and let that thick water off. It is very thick indeed.

25,937. (*Professor Huxley.*) Is that the only preparation your ground has?—Yes.

25,938. In the first instance it is a mud flat?—No, it is a beach.

25,939. A pebble beach?—No, a gravel beach.

25,940. Then in the first instance it was a great flat upon a gravel beach?—Yes.

25,941. And then you dug these ponds?—Yes.

25,942. How large will a pond be?—They differ in size. Perhaps one will be 1,000 yards or 1,500; some may be more and some less.

25,943. A thousand square yards?—Yes, but they vary a great deal in size.

25,944. Are the banks very easily washed down?—No, we board them up inside.

25,945. The banks do not cost much to keep up?—No, but a great deal of settlement takes place. A great deal of stuff gets on to the grounds, and it costs a considerable sum to clean it out. We have to cart it away, and it involves a great amount of labour to keep the beds cleaned.

25,946. If you have much of the mud on the beds the oysters will not get on very well?—No, we like them to be as clear from that as possible.

25,947. Do you allow many dead shells to accumulate?—If the oysters die we bring them out.

25,948. How do you do that?—We have tools for the purpose. The men pick the dead shells out as they go along. They put them into baskets and carry them away.

25,949. How do you get the oysters for sale out of the ponds? Is the water let off?—We let part of it off. We leave about six inches of water and then take the oysters out.

25,950. You do not let the beds go perfectly dry if you can help it?—No.

25,951. When you let them go dry your only object in doing so is to enable you to get out the mud?—No, it is also done when we want to turn the oysters over.

25,952 What is that done for?—To clean them. They gather a kind of settlement after they have laid there for some time, and that settlement if not removed causes the lower oysters to go black. If nothing was done with them they would all die.

25,953. You therefore turn them over?—Yes, we turn them up and bring the bottom ones to the top.

25,954. Suppose you have laid down a cargo of oysters in your pond, what course of operation would you pursue with regard to that cargo of oysters ?—I should let them remain there for some days.

25,955. For how long ?—Perhaps for four days.

25,956. In the first place you would scatter them over the bottom of the bed ?—Yes, they are laid over a space of ground about 40 yards long and 50 yards wide. They are spread overboard from the barges, and in some places they are laid down a foot thick.

25,957. One oyster over another ?—Yes, we then let them lie there for perhaps two or three days, and then we send men in to spread them out thinly over the ground.

25,958. You let them lie over each other in the first instance ?—Yes.

25,959. Why do you do that ?—Sometimes they are weakly, and we think that if we meddle with them when they are in a weak state it causes the filth to go into them. They are not strong enough to spit it out. After they have laid for a certain time in the water they recover strength, and then we spread them out.

25,960. Do you let the water out to a considerable extent to do that ?—Yes.

25,961. Do the men wade through the water when they are performing that operation ?—Yes, but there is not much water in then.

25,962. Do they turn them over with their hands ? No, they turn them over with a kind of utensil they have for the purpose.

25,963. A kind of fork ?—Yes.

25,964. Do they spread them evenly over the bottom ?—Yes.

25,965. How long do you allow them to remain before you consider them fit for sale ?—That depends upon the condition in which they come in. If we require them directly for the market, we should pick some of them out in the course of two or three days ; but if not, we should let them lie there for perhaps six weeks or two months.

25,966. By that time have they got thoroughly cleansed ?—Yes.

25,967. I suppose they will then have got all the fine sand and stuff they might have picked up out of their stomachs ?—Yes.

25,968. Did you ever try any method of feeding oysters ?—I have heard talk of feeding them, but I never tried it.

25,969. Have you ever heard of anybody who did try it ?—Only the fishmongers in London.

25,970. They feed them with oatmeal ?—Yes.

25,971. How do they manage that ?—They only put it in the water I believe.

25,972. Does it do any good ?—I do not know from experience whether it does or not.

25,973. You only cleanse them here ?—Yes.

25,974. Do you think in warm weather that the oysters spawn in your ponds ?—Yes, they spawn much sooner here than they do in the deep sea.
